# COAL AGE

With Which is Consolidated "The Colliery Engineer" and "Mines and Minerals"

## DEVOTED TO THE OPERATING, TECHNICAL AND BUSINESS PROBLEMS OF THE COAL-MINING INDUSTRY

ISSUED WEEKLY

VOLUME XXVIII

July 1 to December 31, 1925

McGRAW-HILL PUBLISHING CO., INC.
10th AVE. AT 36th ST.
NEW YORK

# COAL AGE

*With Which is Consolidated*
*The "Colliery Engineer" and "Mines and Minerals"*

## INDEX TO VOLUME XXVIII

July 1 to December 31, 1925

NOTE—The articles and references in this index have been classified under leading subjects or topics, as far as practicable, and should be sought under such heads, which together with all unclassified matter are arranged alphabetically. Illustrated articles or cuts standing by themselves are indicated by an asterisk (*). All editorials appear under that subject, each having its exact title. Elsewhere the subject matter of an editorial will be found classified and marked (e). Many titles of articles are abbreviated, the aim being to give prominence to important words.

Following is a list of the pages included in each issue of the volume, together with date and number of the issue, for convenience of reference:

| | | No. | Special Issues | Pp. |
|---|---|---|---|---|
| July | 2 | 1 | ..................... | 1-36 |
| " | 9 | 2 | ..................... | 37-68 |
| " | 16 | 3 | ..................... | 69-140 |
| " | 23 | 4 | ..................... | 105-140 |
| " | 30 | 5 | ..................... | 141-172 |
| Aug. | 6 | 6 | ..................... | 173-206 |
| " | 13 | 7 | ..................... | 207-238 |
| " | 20 | 8 | ..................... | 239-272 |
| " | 27 | 9 | ..................... | 273-304 |
| " | 10 | 11 | Island Creek | 339-382 |
| " | 17 | 12 | ..................... | 383-414 |
| " | 24 | 13 | ..................... | 415-450 |
| Oct. | 1 | 14 | ..................... | 451-482 |
| " | 8 | 15 | ..................... | 483-518 |
| " | 15 | 16 | ..................... | 519-552 |

**Accidents. See also "Fatalities"**

—Mine accidents in May killed 181 ...... 88
—Ten dead in Tennessee explosion ...... 157
—Mine accidents in June killed 145 ..... 222
—Soft-coal mines safer than in 1924...... 322
—Death rate in coke making lowest in history ........ 398
—Separate traveling ways ........ 428
—195 killed in coal mines in August .... 466
—Herrin blast kills three ........ 468
—Triadelphia explosion cause unknown .. 503
—When an explosion occurs ........ 566
—142 died in coal mine accidents in Sept. 638
—Eye as victim or culprit (e) ........ 690
—Coal mine accidents kill 141 in Oct. .... 782
—Less than 2,400 perish in coal mines .. 818
—Indiana miners rescue three ........ 862
—Fifty-two die in Alabama blast ........*863
—Not liable to injury to child hired "on quiet" ........ 899

**Alabama**

—Alabama operation issues bonds ....... 193
—Edgewater mine's production ........*241
—Commissary at Edgewater, Ala. .......*269
—Birmingham district visited by Russians 324
—School at Edgewater ........*413
—Kindergarten at Edgewater ........*447
—First-Aid teams in Alabama meet ...... 533
—Mine physician's bungalow ........*584
—Alabama blast kills 52 ........*863
—Conveyors in Alabama mine ........*915

**Alaska**

—Alaska coal deposits prove valuable ... 260
—Production in Alaska in 1924 ........ 398

**Anthracite**

—Mining method cuts cost in steep anthracite ........ *43
—Hard-coal operators ready to fight check-off ........ 51
—Hard-coal reserves for 52 days ....... 54
—Would avoid suspension (e) ........ 69
—The truth might help (e) ........ 70
—Anthracite miners want higher wages .. *71
—Buy anthracite early ........ 86
—Hard-coal operators to run show ...... 87
—Orders cut in hard-coal rates to Staten Island ........ 138
—Raising water from anthracite mine ...*143
—Anthracite conference does not agree ... 456
—Anthracite negotiations smashed ...... 185
—Anthracite operators advise consumers .. 190
—Archbold breaker burned ........ 193
—Lewis breaks off negotiations (e) ...... 207
—Mine and other hazards (e) ........ 207
—Anthracite storage ........*222
—Who has the broken leg? (e) ........ 239

Page

Anthracite—Cont'd.
—Other industries exceed anthracite risks.. 253
—Smokeless aided to compete with anthracite ........ 256
—Federal intervention in strike unlikely 259
—Will there be a strike? (e) ........ 273
—Why not apologize? (e) ........ 273
—Lewis refuses no-strike committee .... 286
—Nobody demanding Washington interfere 286
—The public and the anthracite strike (e) 305
—Time to make repairs (e) ........ 305
—Anthracite men strike ........ 320
—Hard-coal miners off to Europe ...... 320
—Anthracite strike chronology ........ 321
—Hard-coal strike has little scare ........ 323
—Second week of strike ........ 365
—Welsh anthracite for Canada ........ 367
—Keep the issue straight! (e) ........ 383
—Passing the buck (e) ........ 383
—Miners' pay is high ........ 394
—Pinchot calls conference ........ 396
—Retailers back anthracite operators .... 396
—Reserve stock near Scranton ........ 400
—Not sold (e) ........ 415
—What of anthracite's future? (e) ..... 416
—Politics to effect hard-coal strike ..... 435
—Men employed and days worked in anthracite region ........ 437
—Operators reiterate stand ........ 465
—Both sides seek public support ........ 502
—Fair price coal commission in N. Y. C. .. 504
—Hard-coal intervention distant ........ 505
—Retail reserves at New York dwindle .. 505
—You cannot browbeat an economic law (e) ........ 519
—Blending of soft and hard coal ........ 531
—Deepest mine in America ........ 531
—Lewis seeks executive intervention .... 532
—German anthracite to be imported .... 533
—Strikes and lockouts in region 1920-1924 536
—Repeal of certification law (e) ........ 554
—Pinch near in anthracite strike ........ 569
—Rioters injure 10, wreck washery ..... 570
—Uncertainty of hard-coal interests deters stocking of substitutes ........ 571
—Anthracite scrapped by Gov. Fuller .... 571
—Experts talk anthracite ........*598
—Deny rumors of peace in hard-coal strike 603
—Anthracite in storage (table) ........ 604
—Survey shows 670,000 tons of anthracite 604
—Anti-anthracite campaign in New England ........ 605
—Operators and miners await developments 636
—Peace move in anthracite strike .......*668
—Thinks anthracite strike will aid soft coal's cause ........ 671
—Beating anthracite is hard in Winnipeg 700
—Coolidge to keep hands off strike ...... 705
—Lewis appeals to President ........ 736
—Hard-coal operators prepare for fight .. 737
—Strike must be settled on basis of unbroken supply ........ 739
—What does it mean? (e) ........ 755
—Operators reject Pinchot plan ........ 780
—Leisure or the forward step? (e) ...... 799
—Pinchot still central figure ........ 814
—Oppose hard-coal control in Borah bill .. 816
—65 per cent of Bay State's hard coal needs in ........ 816
—Crisis in hard-coal strike at hand ...... 817
—Earnings of contract miners in anthracite field............I-819; II-896; III-931
—Pinchot prolongs strike (e) ........ 835
—Operators case today ........*853
—Pinchot calls special legislature ...... 858
—Strike does not worry this man ......*875
—What the public wants (e) ........ 879
—Progress of the strike (e) ........ 880
—Hard-coal peace plans plentiful ........ 895
—Coolidge link seen in strike's diversion .. 897
—Peace or war? (e) ........ 913
—In praise of partisanship (e) ........ 914
—Resume peace negotiations ........ 930
—Senator La Follette seeks hard-coal data 932
—Congress to push legislation ........ 933
Appraisal of coal mine property ........ 275

**Arkansas**

—To open Okla.-Ark. mines at 1924 scale 670
—Ark. supreme court lifts receivership against District 21, U. M. W. ....... 706
—Ark. union sued ........ 896

**Associations**

—A. E. C. to analyze "Giant Power" plan.. 674
—A. I. M. E. may be headed by S. A. Taylor ........ 571
—A. I. M. E. meeting at Utah, Aug. 31-Sept. 3 ........ 391
—A. I. M. E. nominates ........ 672
—A. I. M. E. and societies in joint safety conference ........ 818
—Ala. Mining Inst. elects Frank Nelson, Jr., president ........ 586
—A. M. C. studies output and distribution 817; meets at Washington ........*848
—Am. Ry. Assoc. report (Soft Coal's Job) (e) ........ 306
—Assocs. decry shipment on consignment.. 935

Page

Associations—Cont'd.
—Byproduct Assoc. needed ........ 639
—Calif. Dealers' Assoc. enjoined ........ 739
—Canadian Inst. of Mining & Metallurgical Engineers meets ........ 818
—Coal Mining Institute of America Seeks Institutes suffrages 741; Father of Parliaments (e) 755; Plans big meeting 779; Discusses problems ........*837
—Correlating Com. discusses standardization ........ 639
—Electrical Engineers meet in anthracite region ........ 703
—Foreign Traders meet ........ 192
—Hazard Coal Operators' Exchange to meet Jan. 22 ........ 947
—Holmes Safety Assoc.'s safety papers...*628
—Ill. mining Inst. meets ........ *83
—Ill. Inst. meets ........ 694
—Ill.-Wisc. retailers elect Kendal ........ 321
—Indiana Assoc. talks safety ........ 815
—Kanawha Operators' Assoc. elect D. H. Morton president ........ 619
—Ky. Owners' Assoc. meets ........ 704
—Moshannon mine men quit ........ 706
—N. C. A.'s co-operation sought by Gould 20
—N. C. A.'s statistics expanded ........ 21
—N. C. A. names committee ........ 124
—N. C. A. starts research program ...... 637
—Nat. Assoc. of Mfgrs. favors non-union operators ........ 860
—Nat. Assoc. of Purchasing Agents announces coal stocks gaining ........ 158
—Nat. Distribution Corp. to attack waste in business ........ 673
—Nat. Industrial Advertisers name chairman ........ 192
—New River Coal Operators' Assoc. Meets. 20
—New River Coal Operators' Assoc. meeting, Dec. 17 ........ 947
—Northeast Ky. Coal Assoc's secretary, Keekamp, urges canal ........ 466
—Operators of Williamson field ........ 206
—Pa. C. M. I. discusses blasting ........ 604
—Pittsburgh Coal Mining Inst. ......*114, 139
—Rocky Mt. Coal Mining Inst. ........*307
—Smokeless Coal Operators' Executive Comm. ........*669
—Societies to hold safety meet ........ 672
—Tenn. Coal Operators' Assoc. to meet Nov. 20. ........ 619
—Trade Assoc. cases ........ 50
—W. Va. Inst. meeting plans ready...... 672
—W. Va. Inst. announces program ...... 704
—W. Va.-Ky. Assoc. meets (e) ........ 520
—Williamson Operators' Assoc. sales reports endorsed ........ 738
—Winding Gulf Operators' Assoc. honors E. E. White ........*862

B

**Bids and Contracts**

—Shipping Board bids are low ........ 22
—Seeks soft-coal bids ........ 637
—Navy coal bids sought ........ 784
—Belgian miners may strike ........ 640
—Raise defers Belgian strike ........ 674
Beware of Mr. Pearson ........ 671

**Blasting, See also "Explosives"**

—Rock-dust tamped, air-cushioned shots .. 78
—Explosives used by bituminous miners during 1924 ........ 159
—Teach better method of cutting and shooting ........*183
—Country used 55,134,000 lb. permissibles in 1924 ........ 462
—New detonator devised ........ 462
—Johnstown men discuss top-rock blasting ........ 604
—Prevent explosions ........*628
—Shooting is heavy at Colstrip ........ 664
—Free powder for Rainey miners ...... 862
—Improved blasting methods ........*881

**Boilers and Furnaces**

—New boilers for Ky. mine ........ *85

**Book Reviews**

—The Miner's Fight for American Standards. By John L. Lewis........ *47
—"Triumphs in Engineering," Conrad Newton Lauer ........ 372
—"Facts found by the coal commission" 372
—How it should be said ........ 855
—The case of bituminous coal ........ 855
—What can be done to give steady employment? ........ 894

**Briquets, see also Fuels**

—Strong briquet binder ........ 139
—Diamond briquets publicity stunt ......*863

**Bureau of Mines**

—Bureau extends safety work ........ 88
—Bureau transferred to Dept. of Comm. 90
—Bureau investigates mine fire hose .... 113
—Bureau appoints advisory comm. ...... 126

**New Equipment**
—Thermal relay added to compensator equip. *68
—Electric sand pipe heater *68
—Cushioned trolley *103
—Gasoline locomotive *103
—Power relay *104
—Shovel is largest on tractors *138
—Strong briquet binder 139
—Wood-boring air drill *140
—Tompkins extension rails *140
—Special iron for car couplings *238
—Speed reducer with ball bearings *238
—Rail clamp makes tight ground connection *272
—Portable welder with gas engine *272
—Roller bearings in centrifugal pump *303
—Oil starting switch *303
—Compressed air locomotive *337
—Inclosed charging panel *337
—Priming device for centrifugal pump *338
—Steel switchboard *450
—Floodlight with reflector *450
—New roller bearing *482
—Protected connector *482
—Air cone prevents spray wasting paint *551
—Floodlight projectors *551
—Motor and control passes bureau tests *552
—Safety switch design *552
—Double insulation improves section insulator *620
—Oil-electric locomotive 640
—Heavy roller bearings for motor *653
—Fuse box prevents contact *653
—Oil forced to upper bearing in vertical gears *654
—Two-casting clamp *687
—Fitting aid pulling wires through pipe *687
—Combined grinder and duster *688
—Manually operated switch *688
—Trolley harp has grease reservoir *721
—Anthracite stoker *721
—Multiple-dial draft gage *753
—Shoveling machine 753
—Self-oiled flexible coupling *754
—Makes stronger bearings 754
—Protective units simplified *797
—Change over switch *797
—Globe and angle valves *798
—Texrope drive *833

## Will Anthracite Men Strike?

A STRIKE in the anthracite fields would be distinctly unfortunate this fall as many labor leaders and anthracite operators fully realize. A strike of any length would immediately start up many a bituminous mine now idle. Soft coal would plunge into anthracite markets. Smokeless coal, especially, would find new opportunities to nick "natural" hard coal territory. Anthracite operators already are harassed sufficiently by loss of markets, without suffering this new impending loss, even temporarily.

Anthracite miners already receive higher average wages than are paid to men in most other industrial groups. Their proposed demand for more pay certainly should not be a fighting point. It is no excuse for a strike and is merely trading ground on which to enter the joint negotiations. Neither does a demand for the check-off justify a strike. Mr. Lewis' possible demand for a long-term agreement comes nearer being a *casus belli.* But, as a matter of fact, none of these will rouse any public sympathy for the miners. They can work up outside support only by a resistance against an actual wage cut, and even that is doubtful in view of the position of anthracite wages, illustrated forcibly in an article in this issue.

No matter what the cause, a strike this fall is bound to damage the entire coal industry involving the public attitude toward miners and operators alike just at a time when the industry as a whole is making actual progress toward sanity and health. If the miners insist upon quitting work in defence of any principle at all, Lewis will be charged with shutting down anthracite to give his starving bituminous men a chance to get in a little work so as to save his union from collapse.

To the average American, a short strike will look like collusion between miners and operators and a long strike like base incompetence calling for congressional action next winter such as nobody in the coal industry wants. Therefore, the joint anthracite negotiations starting soon after this week's tri-district miners' conventions in Scranton, should be a "battle for peace." We hope it need not be "peace at any price."

## Illinois Should Choose Technical Man

AN OUTSTANDING man recently has passed away in Illinois, Martin Bolt, the head of the Department of Mines and Minerals. The state has cause to regret his loss and will have to look carefully for his successor, and when it is being done we would counsel the authorities respectfully that they look for some good man with technical education. Mining men have succeeded without college training, but there is no reason to suppose that they would not have been far more successful with it.

We need character, ability and education, these three. Why be contented with only two of them? The first two are characteristics as to the possession of which there may be some question. The third is a matter of fact that readily can be determined. There is no question but what a man of trained mind at the head of the department will do much to make the work of the bureau effective. Hitherto it has seemed that in most states men with degrees were not wanted, no matter how excellent their other characteristics. Surely it is time for a change of attitude.

## Market Prices

WHAT BRIGHT MIND conceived the idea that market prices should be secret and not quoted? What Dark-Age intellect wanted to deprive the buyer of a knowledge of the current price? Who desired that the consumer should hesitate to buy because he didn't know if a fair price was offered to him?

The basis of good business is recorded prices. The public should favor market quotations as a protection to the small inexperienced buyer, as a means of preventing dishonesty in dealings between agents and as a source of preventing waste in selling expenditure. Open and above-board prices are a refreshing flood-light in industry, but all the people who favored smelling committees and dark-cellar practices prayed for secret prices, condemned the stock and commodity exchanges and the quotations of trade associations and delighted in favoring gum-shoe methods of operation. Waste in merchandising will be largely eliminated when both buyer and seller know the market rate of commodities. Not for any particular industry's advantage are recorded prices to be advocated but for the benefit of all industry and for the advantage of the public.

## Mail Order Coal

RETAILERS in the Midwest and Northwest are reported tremulous over the entrance of a mail order house into the coal business. Of course there are retailers who will feel this competition, at least for a time, but it seems to us highly probable that there is more grief in store for others than for legitimate coal dealers.

The country is full of men who tried to sell coal on a club plan—as somebody in each community must do for mail order houses—and who have rued the day they made their start. In Springfield, Mass, for instance, it was tried under most auspicious conditions. But, strangely enough, trucks were hard to get when the coal cars arrived. Demurrage sometimes rolled up or coal had to be dumped on the ground. The "high grade lump" had a habit of degrading so that a lot of people who paid for lump got slack. Fifty-ton cars often started full and arrived with 45 tons. Somebody had to collect in advance and have the freight charges in hand at the station. "Members" occasionally left the "financial officer" holding the sack. Scales were hard to find. There was trouble all along the line.

Most of these worries are not faced by the mail order firm. All that concern purposes is to furnish the coal after the "financial officers" have sent in the money. Its price quotations are attractive and it is reasonably sure of some business at a small profit. It may get into arguments over weights and quality, but most of the troubles are in store for those unfortunates who undertake to handle the mail order house's carload lots locally. These individuals will disturb the peace of retail dealers for awhile but probably not for long. It is to be fervently hoped they disturb retailers who believe in excessive margins of profit. They may thus perform a service for their communities and for the coal industry generally. But in general, tears, argument and grief immeasurable will be their lot.

## Machines Always Defeat Prejudice

WHENEVER mechanical devices have been developed to take the place of human muscles in the performance of useful work in the service of mankind, the people possessing the muscles displaced have raised strenuous opposition. This has been true of the spinners, the weavers, the iron and steel workers, the miners, and even the slate pickers in the anthracite breakers. But how men do change!

When it was sought to introduce the first mechanical slate picker a few decades ago its inventor narrowly escaped personal injury or possibly even a lynching at the hands of an irate mob that strongly resented his attempt "to rob the little boys of their living." Yet, today mechanical picking is all but universal and the breaker boy of twenty or thirty years ago, as a race, is almost as extinct as the bison or the great auk—he is now in school where he belongs, and everybody is happier because of that fact.

While the opposition of the laboring man to mechanical devices that supplant the work of his hands is poignant at the outset it soon turns to favor when he reaps his share of the benefits that accrue from the change. Would the spinners of today willingly revert to the hand-operated spindle? Would modern weavers voluntarily go back to the old foot looms? Would the anthracite workers like to see the old picking chutes revived?

Economic laws are as inexorable as are those of nature. Both may be dodged or even successfully opposed for a time but in the end they always triumph over the designs of men—and to the benefit of all concerned. Each advance of mechanical devices in industry, while it may temporarily throw men out of employment, soon creates a bigger and better demand for their services either in the same industrial field or elsewhere.

Instances of this kind were particularly striking during the past hundred years. Railroads were opposed by the farmers because they believed that they would destroy the market for horses to be used in "teaming" goods and grain. Inevitably the iron horse won over its four-footed rival, yet the market for horses was never more active than today. The farm hands of the past opposed the reaper and the threshing machine because they believed these devices would render their services unnecessary. The reaper has long since totally supplanted the cradle even as this device supplanted the sickle; the threshing machine long ago sent the flail to the discard, yet farm owners were never more sorely in need of help than today. And the farm hand can now sell his services for $50 to $70 per month with board and washing to boot, whereas in the old days he was fortunate if he could get $8 or $10 for a similar period of time.

It is by no means strange that the miners of today oppose the introduction of shoveling machines, power drills and other mechanical labor-saving devices within the mines. A few years ago they similarly opposed the introduction of mining machines and explosives. But where, today, can a miner be found who would gladly return to the practice of pick undercutting and bringing the coal down by means of sledge and wedges? Not much! The present-day miner in most instances, if deprived of the services of a mining machine, would unhesitatingly shoot the coal off the solid, state laws and company rules to the contrary notwithstanding. There is plenty of evidence to back this statement.

Man is a lazy sort of a creature! Having once learned to load coal mechanically he rebels at the idea of going back to the old hand shovel. The fact that certain coal operators who encountered severe opposition from their men when they sought to introduce loading machines are now encountering almost equal difficulty from the same source when they suggest that these machines be removed and that those who ran them go back to hand loading, is a decidedly encouraging symptom.

Beyond shadow of doubt mechanical loading has come to stay. It will be difficult for any man or any group of men to fly for long in the face of economic necessity and prevent its adoption. And when mechanical loading has once become an accepted fact, woe be unto him who even suggests a reversion to hand methods!

## Going South Again

CIVILIZATION had its origin in tropic climes. In the tropics the growth of vegetation was rapid, and man could live without toil. The ground gave its fruits without cultivation. But the progress of agriculture opened the way toward Northern exploitation and the Northerner found he could warm himself in the winter by wood and later by coal and not being enervated by heat he was a more active individual than the inhabitant of the tropics and soon gained political mastery.

If the houses of the South could be made cool and endurable, your southern farmer would be the better producer for he would have all the rapidity of growth that has made the South rich and all the energy that goes with a relief from the heat. The cooling of houses will redistribute mankind. A siesta in a well-tempered atmosphere when the sun is hottest and work in the cool of morning and evening lightened by machinery will make an ideal condition of living. The growing season will last twelve months. Not only will there be less seasonal industry but there will be more equal distribution of the world's peoples on the face of the earth.

Artificial cooling will make the South as suitable for living as artificial heating has made the North, and southern markets for coal will be as active as northern. The promotion of air cooling by refrigeration will solve many of the problems of coal—seasonal inequalities in industrial demand as well as like inequalities in the domestic market. The next move of the people of the United States, which has already started for other reasons, is and will be, down South. Great movements in population have occurred before in history and for reasons not so readily apparent.

# Old Ben Coal Corporation Effects Large Savings With Modern Electric Equipment

## Replacement of Efficient Steam Hoists by Electrified Units Justifies Itself—Benefits of Diversity Factors Are Realized by Transmission Line Linking Up Mines

By A. W. Spaht* and G. E. Marble†

THE COST OF POWER at coal mines is an important item of expense. In order to reduce it and thus lower the cost of producing coal the Old Ben Coal Corporation with twelve mines in southern Illinois has changed its equipment at eleven of the twelve from steam to electric operation. Complete new equipment was used. The change is striking because it is one of the largest electrifications ever made in the coal industry.

It is not possible to measure the exact dollars-and-cents economy wrought throughout the company by the electrification because of irregularity of operation at so many of the mines during the past winter but the indications are the saving at one mine will be in the neighborhood of $50,000 and no doubt economies at the others will be comparable. The company is convinced, however, that idle-day power costs under electric operation are much less than those borne in the days of steam. The principal equipment installed was hoists.

Of the twelve mines operated by the Old Ben Coal Corporation in the Franklin County field, mines Nos. 8, 9 and 15 were sunk by the Old Ben Co. The other mines were purchased. With the exception of one, all were originally steam operated. At the No. 11 mine an electric hoist of 1,150 hp. was installed in 1912 when the mine was sunk. Power for this mine was supplied from a 5,000-kva. plant located at the mine and owned and operated by the coal company. The only steam for mining purposes was used in operating a material hoist at the air shaft and for heating.

The surplus power generated by this mine plant was supplied to its other mines, as emergency power, and to a public utility company. All of the power taken was carefully metered and a permanent record of the requirements was kept from the beginning. The power required for the various operations, such as hoisting, ventilating, cutting and hauling, and for the tipples was also measured on separate meters.

A graphic wattmeter gave a continuous record of the total load, hence this company had accurate data, over a period of several years, covering the exact power requirements of an electrically operated mine in all stages of development.

The twelve mines had been connected electrically by means of a 33,000-volt transmission line originally intended to supply power to the various mines in case of trouble with the local steam plants. Motor-generator sets and a spare motor drive for the fans had been installed at each mine. The substations at mines where no alternating-current energy was generated consisted of two or three 200-kva. transformers, making banks of 400 or 600 kva. capacity.

At the No. 9 mine there was also a 2,500-kva. turbine-generator which was operated in parallel with the No. 11 plant. Thus the alternating-current power system consisted of 7,500 kva. in turbine driven generator capacity, with 43 miles of 33,000-volt transmission lines and a number of 33,000-to-2,300-volt step-down substations. Metering equipment at all points made it possible to determine the line and transformer losses in the system. The location of the mines and the transmission system is shown in Fig. 1.

Most of the twelve power plants were better equipped than the average mine plant. The plant at mine No. 11 had water-tube boilers, stokers, superheaters, soot blowers, feed-water treating and filtering plant, coal and ash conveyors and a 225-ft. stack. No. 9 plant had water-tube boilers, traveling grate stokers burning No. 5 coal, forced draft, and coal and ash conveyors. Two of the ten remaining plants had water-tube boilers and stokers and water treating plants; two had low pressure turbines utilizing the exhaust steam from the hoisting and fan engines; nine had brick or concrete

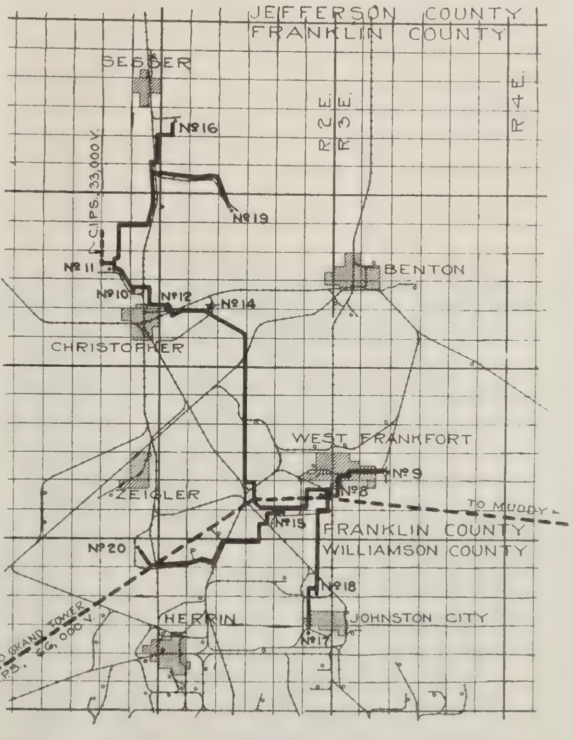

Fig. 1—Map of Old Ben Properties in Southern Illinois

The dots represent the 66,000-volt line from a power company. The solid black traces the course of the coal company's 33,000-volt transmission lines from the main substation to the mines.

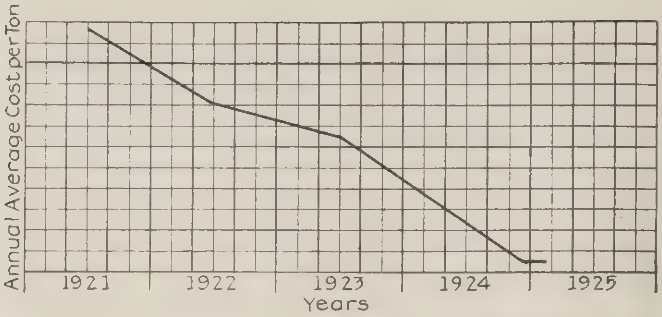

**Fig. 2—Large Savings Are Effected by Electrification**

The way the energy cost per ton has been lowered from year to year by changing steam-operated equipment to electric drive is apparent by this curve. Now that the electrification has been practically completed, note that the cost curve has flattened out.

stacks of ample capacity. All of the fire-tube boilers were hand fired.

Six of the plants had ash conveyors, and all had coal conveyors taking coal from the tipple direct to the boiler rooms. The twelve plants had a total of 18,430 rated b.hp., and 14,300-kw. rated generator capacity. All had high-grade, first-motion hoisting engines and fan engines and all had ample water supply from surface reservoirs.

An accurate accounting system gave thoroughly dependable power cost records at every plant. The cost of the alternating current generated in the turbine-driven units was known. The transmission and distribution losses were known, as was the cost of operating each local steam plant. It was possible to make close estimates of the kilowatt-hour requirements of each mine and the maximum demand if all were operated electrically. The rate at which power could be purchased was known. It was simply a matter of deciding if the saving in power costs would justify the change from steam to electric operation.

Strangely enough, this was the easiest part of the problem. The records plainly showed that the electrically operated mine had a larger margin of economy over the best equipped steam mine under all conditions of operation, from steady working conditions to long periods of idleness. The figures further showed that the saving in power cost would pay for the entire change in less than two years. Hence it was decided to discontinue the use of steam in all cases except at one mine, No. 10, which is so nearly worked out that it will be finished with the steam hoist.

The question of purchased power was then investigated. First to be considered was the dependability of the power supply, second, the necessary capacity, and third, the cost. The size and arrangement of the Central Illinois Public Service Co.'s power plants and steel tower transmission lines left no room for doubt as to the first two points. In the case of the third item the cost records showed that purchased power would cost practically the same as when generated in the company's own plants. Hence it was decided that, inasmuch as the main object of the Old Ben Coal Corporation was to mine and distribute coal, the generation of power would be left to the power company, and therefore, purchased power was decided upon.

All of the power is taken at 33,000 volts and measured on one meter. This gives the coal company the benefit of the diversity factor, and consequently a comparatively high load factor.

The power factor of the system is maintained well above 0.9 by means of synchronous motor-generator sets with motors rated at 0.8 power factor leading. There are twenty-six motor-generator sets in all; two of these are of 200-kw., nineteen are of 300-kw., and five are of 500-kw. capacity.

It was necessary to rearrange the transformer substations to suit the mine loads. The 200-kva. transformers were grouped in banks of three and the banks operated in parallel.

In the selection of hoists for the other mines each duty cycle was treated as a separate case. It was found, however, that in some instances the equipment required did not vary greatly from that necessary at another mine. In such cases duplicate equipment of the largest size required was purchased. Four of the mines had steam hoists at the material handling shafts. These were changed to geared, alternating-current, motor-driven hoists. Fifteen electric hoists were required. All changes from steam to electric hoisting were made without interfering with the regular operation of the mines. Table No. 1 gives interesting data pertaining to the main shaft hoists.

It will be observed by referring to this table, that the

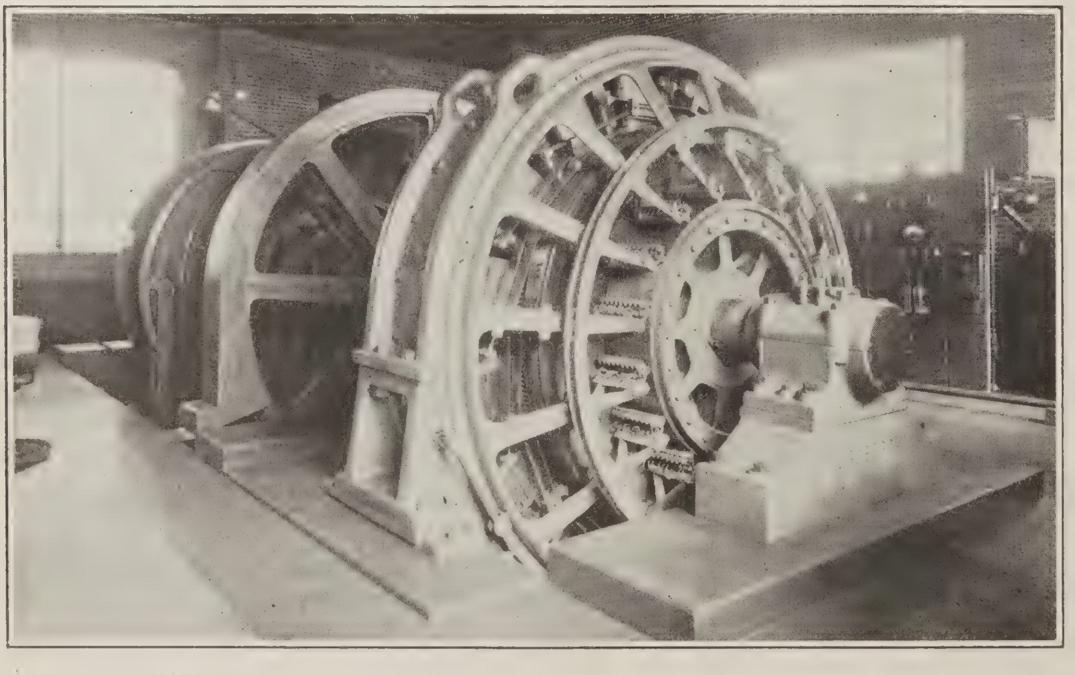

FIG. 3

**There's Power Here**

Accurate speed control and high operating efficiency is obtained by this 2,200-hp. direct-current hoist motor—one of the largest single-motor hoists in the coal mining industry. Alternating-current is converted to direct-current by means of a large flywheel type motor-generator set located in the same room as this hoisting equipment.

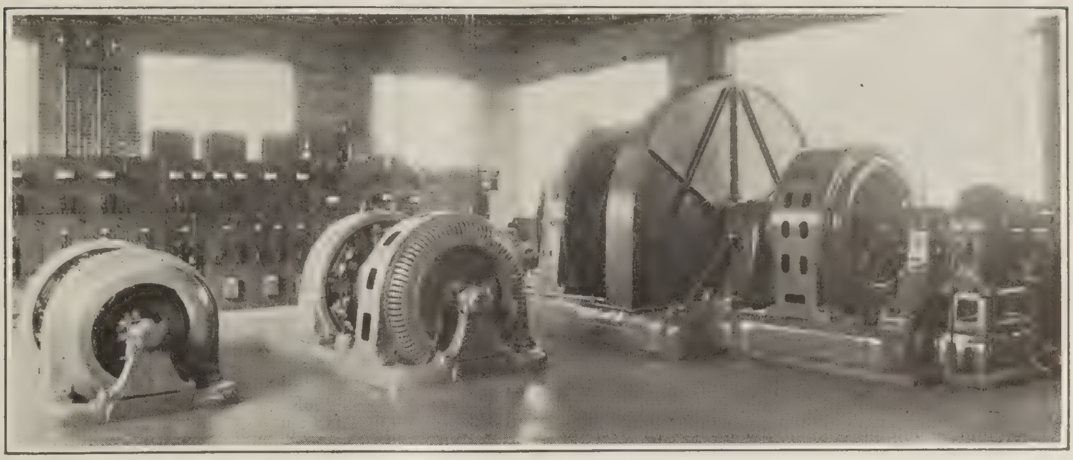

FIG. 4

**A Giant Unit**

The 500-kw. and 300-kw. synchronous motor-generator sets used to supply direct current for mine service, look small alongside this 1,500-kw. flywheel set in the hoist house at mine No. 8 at West Frankfort, Ill.

hoists at mines Nos. 8, 9 and 15 are duplicates. A brief description of one of these outfits should be of interest, particularly because of the size of the equipment and the heavy duty cycle. The hoist motor is rated 2,200 hp. at 110 r.p.m. and is directly connected to the drums. A motor-generator set furnishes the power for the hoist. It consists of an induction motor rated 1,000 hp., 2,200 volts, 514 r.p.m.; a direct-current generator rated 1,500 kw., 600 volts; an exciter rated 37 kw., at 250 volts, and a 45,000-lb. steel plate flywheel. By means of a slip regulator and torque motor the heavy peak loads are automatically taken by the flywheel and the input to the induction motor of the motor-generator set does not vary more than 7 per cent above or below the average.

The drums of the hoist are of the cylindro-conical type with a small diameter of 7 ft. and a large diameter of 11 ft. The small diameters are in the middle with the brake ring between them. Take-up drums holding 100 ft. of rope are provided inside the large drums. The brake, which is oil operated, is set by gravity and released by oil pressure furnished by an accumulator having geared pumps.

The hoist is equipped with a geared auxiliary alternating-current motor drive, for use on night work or idle days.

The duty cycle on which the hoist operates is as follows:

| | |
|---|---|
| Average weight of coal per trip, lb. | 8,400 |
| Total lift, ft. | 520 |
| Number of trips per hour | 200 |
| Time of rest period for caging, sec. | 3.5 |
| Time of acceleration, sec. | 5 |
| Time of full speed run, sec. | 4.5 |
| Time of retardation and dumping, sec. | 5 |
| Maximum rope speed, ft. per minute | 3,800 |
| Total weight of moving parts to be accelerated, tons | 75 |

It was realized that such severe requirements could not be met by ordinary hand control and that automatic control must be used. If the equipment had failed to meet the cycle by one second per trip, it would have meant a loss of 350 tons per day. Hence it was imperative that the duty cycle be met, and the present equipment does it nicely.

Automatic acceleration is accomplished by means of a system of current-limiting and counter-electromotive force relays in connection with the contactors governing the generator field. The operator simply throws the master controller to full running position and the hoist accelerates automatically at the predetermined rate.

Automatic retardation is effected by means of cams geared to the drum shaft working in connection with the master controller. At a certain point in the cage travel, the cams move the master controller to the "off" position and the hoist is automatically stopped. A spring link connection between the cams and the master controller allows the operator sufficient controller capacity for any necessary maneuvring at the end of the trip, such as redumping.

**Table II—Fan Data**

| Mine No. | —Size in Ft.— Diam. | Face | R.p.m. | Volume Cu.Ft. per Minute | Pressure In., Water Gage | —Driving Motor— Kw. Input | Kw.-Hr. per Day |
|---|---|---|---|---|---|---|---|
| 8 | 16 | 6 | 120 | 160,000 | 4.00 | 118 | 2,840 |
| 9 | 16 | 6 | 120 | 165,000 | 3.50 | 106 | 2,541 |
| 10 | 14 | 5 | 170 | 167,000 | 2.50 | 111 | 2,660 |
| 11 | 12 | 6 | 104 | 193,000 | 1.00 | 64 | 1,540 |
| 12 | 13.5 | 7 | 185 | 200,000 | 3.75 | 153 | 3,676 |
| 14 | 16 | 8 | 131 | 241,000 | 3.25 | 180 | 4,309 |
| 15 | 16 | 6 | 44 | 49,600 | 0.40 | 24 | 581 |
| 16 | 10 | 6 | 134 | 134,240 | 2.00 | 47 | 1,132 |
| 17 | 12 | 4.5 | 160 | 85,000 | 2.25 | 45 | 1,071 |
| 18 | 16 | 5 | 106 | 180,000 | 2.00 | 101 | 2,423 |
| 19 | 16 | 5 | 75 | 90,000 | 2.00 | 31 | 754 |
| 20 | 16 | 5.5 | 130 | 120,000 | 1.60 | 39 | 938 |

All braking is dynamic and of the necessary value to bring the hoist to a stop at the proper point regardless of the weight of the load. The mechanical brakes are used only for holding the drums after they are stopped. The kilowatt-hours per ton taken by this equipment, when hoisting in accordance with the duty cycle, is given in Table I.

Because the power taken by the fan is usually a large part of the total requirements of a mine, Table II is included to show what the twelve fans are doing. The

**Table I—Main Hoist Data**

* D. c. motors in tipple are included in underground power. †This figure includes power taken by rock dust mill.

figures given are not the results of short tests but are the monthly kilowatt-hour consumption averaged over several months and divided by the number of days in the month, thus representing normal operating conditions.

It will be noted that the over-all efficiency of the No. 15 fan and drive is low. This is due to the operation of a large fan at a small fraction of its rated output, and brings up the question whether it would not pay to install a smaller fan when sinking a new mine and replace it with a larger one when required. The fans are all belt-driven by General Electric Co. squirrel-cage motors. Motor pulleys are changed when different fan speeds are required.

Table III shows the kilowatt-hours taken by the various mine operations during a 24-hr. day, when coal is hoisted only 8 hr. Thus, the figures include the fans and pumps for a full day of 24 hr. as well as the power taken by the auxiliary motors on the hoists, and by the flywheel sets when running but not hoisting coal. The latter condition occurs at noon and when handling men before and after the regular hoisting period.

By comparing these figures with Table I, the power taken by the hoist, in addition to that required for hoisting coal, can be determined. Also, by the use of these tables, it is possible to make estimates of idle-day requirements. This table covers only mines that were operating during the past winter. The others are temporarily shut down due to market conditions.

The curve in Fig. 2 shows the proportionate decline in power cost per ton during the transition period from steam to electric operation, covering a period of four years. The points on the curve were obtained by dividing the total annual power cost for the system by the total output in tons of coal. The point in 1925 represents the January results, this being the first month in the four years when no steam was used for mining purposes. This last figure gives an average for the twelve mines very close to the cost that has prevailed at No. 11 mine, and agrees with the estimated results.

# "Ship No Unsold Coal," Says Ord To Mine Operators

### Suggests Big Producers Aid Small Ones in Sales Thus Reducing Number of Agencies—Asks for More Complete Coal Data Reports

Coal shippers too often have stabbed their own business in the back by moving unconsigned coal toward markets, W. D. Ord, president of the Empire Coal & Coke Co., of Landgraff, W. Va., told the National Coal Association at Chicago, June 18. He introduced the subject "Open Consignment of Coal" with a statement by Judge Elbert H. Gary made in his address to stockholders of the U. S. Steel Corporation at their annual meeting on April 21, 1924. "We could sell," said the judge, "a great deal more temporarily, perhaps, at any time if we would make our prices low enough. That, in my judgment, would be the worst policy in the world, because it would be only temporary, others would do the same thing and the result would be to risk and hazard our profits for the future." "That," said Mr. Ord, "is the direct antithesis of the policy pursued by our industry."

Mr. Ord brought out the difference between farming and coal mining. "Farming," said he "in all its branches is perhaps the only other industry approaching our own in troubles, and yet the farmer has so succeeded in presenting his plight to the public that he is not only specifically exempted from anti-trust laws, but remedial laws for his benefit have been passed and others sugegsted and discussed. He can by concerted action so reduce or change his crop acreage each year as to bring the volume of his product within the anticipated consumption. In our own industry no two or more of us may confer together with the purpose of curtailing or limiting future production."

"Among the serious symptoms," said Mr. Ord, "accompanying and contributing to the weakness of the industry, is the practice, of operators who are in need

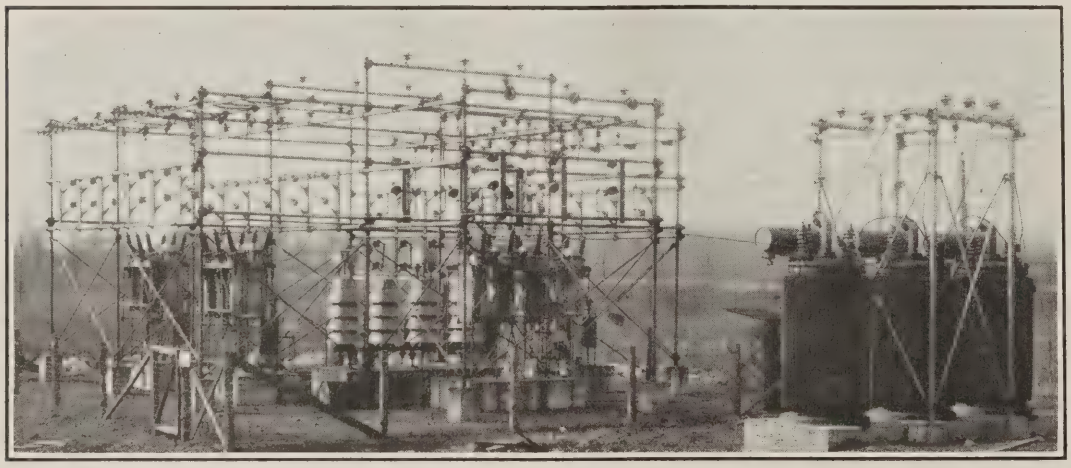

FIG. 5

**Old Ben's Outdoor Substation**

A 33,000-volt line from the power company's huge substation 800 ft. away delivers current to the coal company here for distribution to the mines. All of the coal company's power is measured on one meter at 33,000 volts. This gives the coal company the benefit of the diversity factor and, consequently, a comparatively high load factor.

of orders, of shipping coal before it has been sold. Information is lacking as to the exact extent of this practice. In some of the fields the associations do get information as to the unsold tonnage standing on the tracks of originating railroads in their own territory, but who has any information as to the unsold tonnage standing upon tracks in Chicago, Cincinnati or Detroit? Though definite information on the subject is lacking, it is a matter of common knowledge that in times of depression like the present a considerable volume of coal goes out unconsigned.

"This is not the worst of it. When ten such cars of coal arrive, let us say, at Chicago, demurrage charges soon begin to confront the operator. Not only does he reduce his price by degrees as the demurrage pressure increases, but he offers that coal to ten different brokers, each of whom proceeds to try to market it. The effect on the market is that by this simple process the ten cars have grown to one hundred.

**W. D. Ord**

President, Empire Coal & Coke Co., who assailed the practice of shipping coal on open consignment.

Mr. Ord presented a chart showing together the average daily stocks of coal on hand on the Lamberts Point, Newport News and Sewalls Point docks for each week during the year 1924 and the average weekly price of pool No. 1 smokeless coal on board vessels as quoted in *Coal Age*. To this were added lines showing the average daily price for the year and the average quantity of coal left standing on the piers daily. He showed that whenever the line representing average stocks crossed on its ascent the line of annual averages for that line the price declined; perhaps not that week but at least within the week following.

Mr. Ord asserted that a contract of sale should be a sale and should be made on such terms as to be irrevocable. He quoted an article by a purchaser of coal in which it was said that "The coal salesmen who come around trying to sell me are the least on their selling toes of all the many who infest my office" and that the coal salesmen try to sell wholly on price and not on merit and so are soon set bidding against each other.

This purchaser said that, owing to this tendency of coal salesmen he could easily make the coal salesman pay him money for buying his coal. The purchaser declared he had found a coal that would make him steam at a lower price than any other easily available but the salesman who sells him this coal lets him have it at the price being paid for inferior coals on the same market and pats himself on the back for his clever salesmanship.

"A large part of the total output" Mr. Ord said "comes from mines too small to maintain their own sales departments. Such mines frequently unite in groups and sell through some common agency, which may or may not be financially interested in the production. The evils of this system are largely due to the ignorance of the producer and to the prevalent unhealthy practice of basing the seller's compensation on the quantity of coal sold rather than on the price obtained. Moreover, if such an agency is conducted legally, the operators using the same agency cannot get together as a group to discuss the market and fix the selling price for their agent. Each operator must arrange individually with the common selling agent. Imagine the diversity of opinion among these operators as to the market, about which they have no information, the resulting embarrassment to the agent, and his difficulty in equitably distributing the business under such conditions.

"This situation in some instances is further complicated because of ownership by the agent of auxiliary facilities, boats, docks, etc., which represent heavy investments on his part and which must move tonnage to avoid ruinous overhead whether the operator makes any profit or not.

"At times of heavy demand for coal, buyers have been known to send representatives among coal operators offering inordinate prices in order to bribe them to divert to their uses coal already sold under contract to others. This reprehensible practice begot a situation that is expensive and intolerable to both operators and consumers. Many of these agents, trained in such unscrupulous methods, and finding the coal operator an easy mark, set up their own selling agencies. Some of them were without experience, connection, resources or stability, and many of these are being carried by the coal industry even today. I have in mind an instance where approximately 35,000,000 tons of coal are being sold through fifty-three different general agencies with a veritable army of sub-agents, etc. What business can possibly stand such extravagance as this?

"In conclusion may I submit the following recommendations:

"(1) That we discontinue the practice of shipping any unsold coal to any market;

"(2) That because wrong sales practices, in however small a part of the bituminous coal industry, harm the whole industry, and because for that reason it is to the interest of the larger producers to assist smaller producers in marketing their coal properly, the members of this Association give serious thought to the problem of reducing the number of sales agencies and developing a sane, profitable method of selling coal;

"(3) That in view of the recent Supreme Court decisions, to the effect that the collection and publication of market statistics about closed transactions is not in violation of the provisions of the Anti-Trust law, operators, through their Associations, inaugurate the practice of gathering and disseminating such statistical information as will give them the facts they need in wisely directing the operation of their plants and the marketing of their product;

"(4) That every proper effort be made to secure such modification of the Anti-Trust law as will permit the practice of co-operative joint selling of coal at least from each individual coal district."

In the discussion that followed it was said that the evils described by Mr. Ord had been in existence for over thirty-five years and had made the fortunes of the jobber. He had traded profitably in distress coal. In other words the coal scalper had made the profit. Why buy of the producer when he would market coal the jobber could sell for less?

# Union Fields Have Reached the Turning Point

## High Wages Have Them Against the Wall Says Observer—Cut to $5 a Day Would Largely Solve Their Problem for Unorganized Regions Cannot Go Lower than They Are Now

**By C. E. Lesher**
Assistant to the president, Pittsburgh Coal Co.,
Pittsburgh, Pa.

WHEN A TON of soft coal can be bought at the mines for $1.30 why pay more? All over the states of West Virginia and Kentucky, and in parts of Pennsylvania, mines are pouring forth thousands of cars of coal each day, eager for a market at prices ranging from $1.25 to $1.60 per ton; good coal for making steam, firing locomotives, melting iron or making coke. In the Northern fields, where the United Mine Workers are in power, the Jacksonville wage scale holds the operators to a cost for labor alone which equals or exceeds the selling prices of the Southern non-union coal.

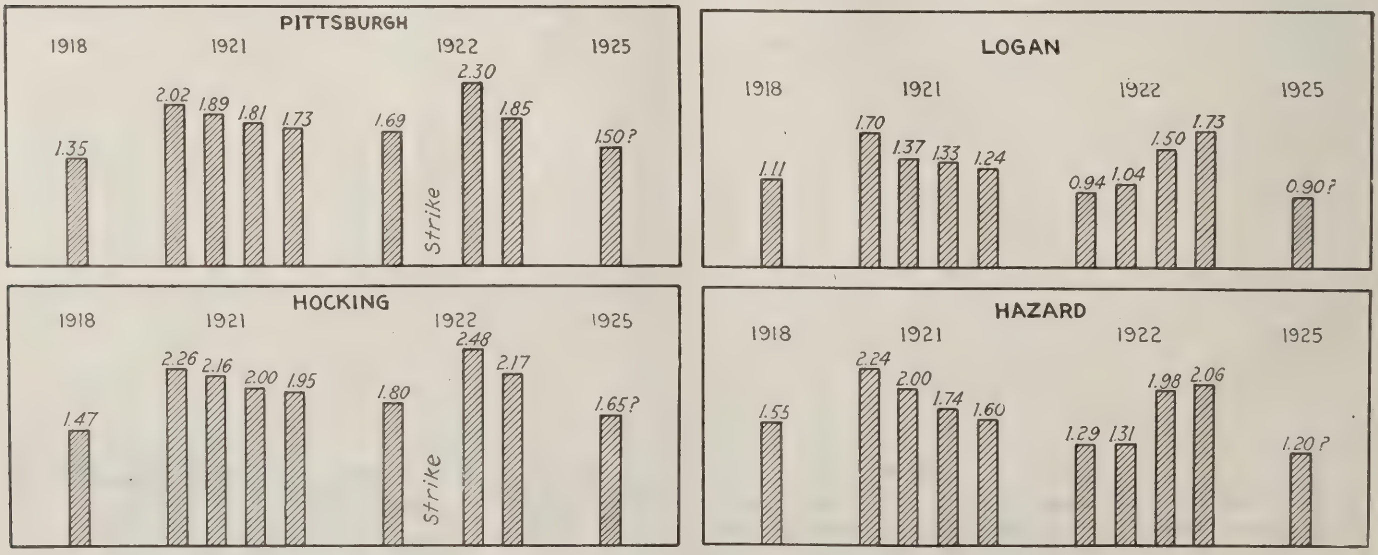
This in a word tells the story of the present difficult situation in which the union fields find themselves. Of these union fields Pittsburgh is hardest hit. The majority of the mines here are closed and non-union coal is pouring into our markets. The conditions that have prostrated the commercial operators and vitally affect the industrially owned or captive mines are not the result of any sudden or precipitate action. They are the outcome of a long series of related events. It is rather that the situation has reached a climax—a crisis, if you will. In the economic warfare that has driven in the market frontiers of Pittsburgh district coal a turning point has been reached. Pittsburgh has its back to the wall.

The war time demand for coal, the 1920 industrial boom and the coal shortage following the 1922 strike of nearly half a year all contributed to the expansion of the soft coal industry. The easy profits of those unusual periods enticed much new capital into the mining game and the recurring shoftages caused many large consumers, as steel companies and utilities, to open new large mines of their own. The high wages attracted thousands of men into the ranks of the coal mine workers.

A fuel hungry country took all the coal the railroads could move in the first few months after the 1922 strike. Every operator had a chance to produce and sell at a profit until finally by the middle of 1923 stock piles were replenished and demand and prices dropped. The decline that set in then followed through 1924.

Today and for a year past competition has ruled the soft coal business. The pace was set early in 1924 by the non-union operators. The price of soft coal dropped a dollar a ton almost as soon as the urgent demand of 1923 was satisfied. As the price dropped the non-union fields reduced wages and by thus cutting costs, were able to stay in the game. The Island Creek Coal Co. is the outstanding example of large scale non-union coal production. That company in 1923 produced 3,000,000 tons. By reducing wages and costs it was able to set a low price. Sales were nearly 5,000,000 tons in 1924 and have recently attained a monthly rate of 600,000 tons, or more than 7,000,000 tons per year. This is expansion with a vengeance.

While the union miners were on strike through nearly half of 1922, the non-union fields, eager and willing to meet the urgent demand of industry for coal, succeeded so well in expanding their capacity that they reached a weekly output of nearly 6,000,000 tons, hampered though they were by car shortage and with a portion of the non-union territory on strike. The expansion thus under way has proceeded so that today these non-union operations, mainly in the South, may easily produce 7,000,000 tons of soft coal a week.

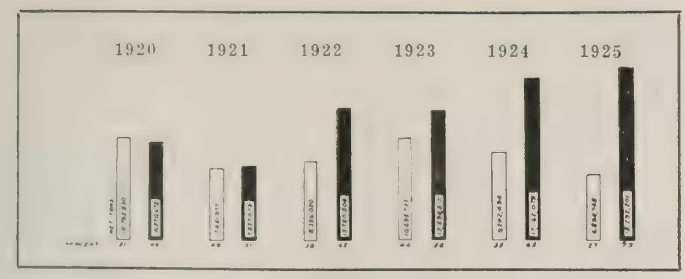


**Comparison of Labor Costs in Two Union and Two Non-Union Highly Competitive Fields**

Except for boosts in wages in 1922 following the strike settlement in the union regions, the labor costs per ton in the Logan and Hazard fields have steadily diminished below union wages to 1925 levels of 90c. and $1.20. This illustrates the wage advantage the non-union fields have always had.

---

From a paper delivered on June 16 before the Engineers' Society of Western Pennsylvania.



**Non-Unionism Prevails in Appalachian Region**

This chart traces the flow of coal from Appalachian districts by railroad to destinations between Erie, Pa., and Milwaukee, Wis., on the north, and the Ohio River and St. Louis, Mo., on the south. It includes revenue coal only. The figures are for three-month periods, Jan. 1 to March 31, 1920 to 1925. The white blocks in each pair represent union coal and the black blocks non-union coal.

Whereas, in the general strike of 1919, the union closed down 71 per cent of the bituminous coal mine production, leaving less than 30 per cent in operation as non-union, and cut production from more than 12,000,000 tons to less than 4,000,000 tons per week, to such an extent has the United Mine Workers lost ground and non-union mine capacity been increased, that today the unorganized fields can produce, not 30 per cent of the required soft coal for this country, but more than 70 per cent.

Indeed, measured not in capacity but in production, the figures are even more striking. In May, 1923, 47 per cent of the soft coal produced was non-union, in May, 1924, 54 per cent was non-union, and in May, 1925, the lower-priced coal from the unorganized fields represented 70 per cent of the total output of the country. Throughout 1924 the union producers sought to retain their trade; they produced coal at union wages and, selling it at prices set by the non-union producers, took substantial losses. There is very little consuming territory that the non-union mines cannot reach at freight rates but slightly higher than from the nearby union coals.

The bituminous coal industry is overdeveloped. It has had rapid and wide fluctuations in production. But the iron and steel industry, the rubber, automobile and machine tool industries, to mention but a few, are overdeveloped; they suffer from cyclic variations in output; they are subject to booms and depressions as is coal.

Viewing the bituminous coal industry as a whole—taking into consideration the many fields in the United States—it is well said that there can be no stability and no profits until the capacity is deflated; until thousands of operators and mines and hundreds of thousands of mine workers are eliminated. It would be a most satisfactory condition were there but mines and mine workers sufficient to produce say 10,000,000 tons of coal each week, and then that the demand could be so regulated that 10,000,000 tons would be produced each week throughout the year. That indeed would be ideal for thus capital and labor would both be regularly and completely employed.

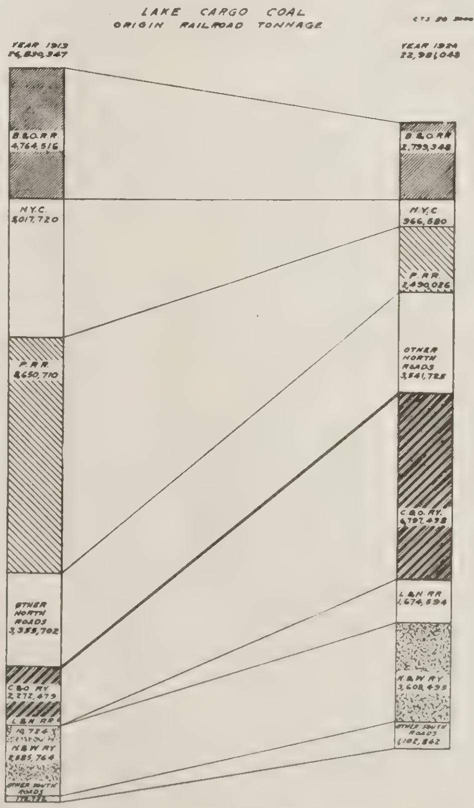
The anthracite industry has approximated that happy state, but only after a quarter century of struggle comparable to that now taking place in the bituminous coal industry and not until the entire undeveloped resource had been taken into ownership by the producing companies. How idle it is to anticipate such a solution in the soft coal fields, vast as they are and widespread. There are now too many tons of coal ready to be produced and constantly offered for any but the very favored few to realize a profit in the operation.

Yes, the bituminous coal industry is overdeveloped; it must be deflated but it cannot be deflated to the extent or in the manner our great idealist in Indianapolis hopes. What is involved in wiping out overdevelopment? How is deflation of coal mine capacity to be accomplished? The reverse of inflation, of course. Instead of adding mines and jobs for mine workers, it means subtracting mines and jobs for mine workers.

Closing a mine, discharging the men, shutting off air and stopping pumps does not, however, permanently subtract a mine from the list, for the mine may be reopened. Complete abandonment, destruction of the facilitiy for production and writing off the capital invested is the only real method of deflation.

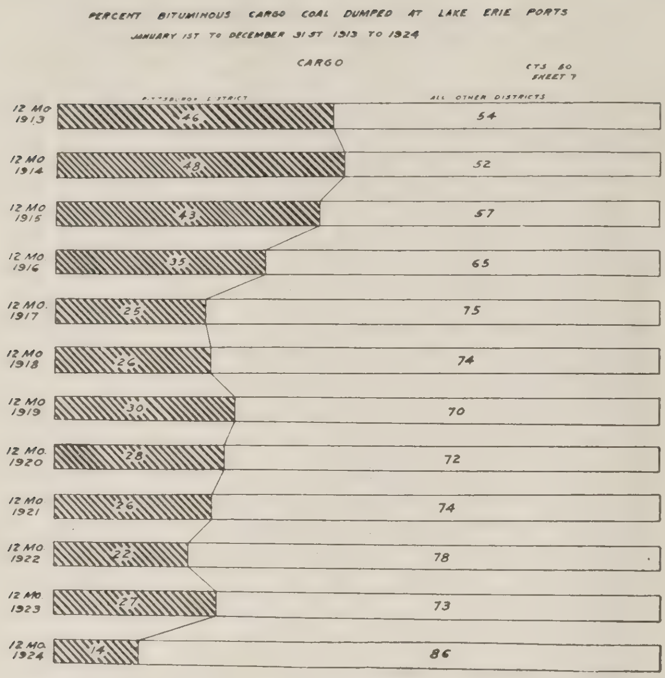
No reasonable, thinking coal man refuses to admit the logic of this. All know that some, many in fact, must be forced out through sheer inability to compete. That is American business. But the competition for business, the struggle of the fittest to survive must be governed by rules of the game that will equalize the opportunity. Other things (such as quality of coal) being equal, it is cost of production and freight rates to consumers that fix the limits of competition. There is a fair tribunal before which the coal operator may take his questions of freight rates. There are definite ways, certain well defined procedures that mark the settlements of freight rate controversies. This tribunal, the Interstate Commerce Commission, has constantly before it the complaints of coal operators.

With respect to the other largest item in cost of put-



**Coal Traffic of Railroads to the Lakes**

The carriers serving mines in non-union fields have made substantial gains in tonnage of coal as between 1919 and 1924. On the other hand the three major roads hauling from union fields in the East have had a slump. The Baltimore & Ohio R.R., since April 1, 1925, has been retrieving much of the business because of the growth of non-union tonnage from northern West Virginia.



**Decline of Lake Coal from Pittsburgh District, 1913-1924**

Over this 12-year perior there has been a gradual falling off of coal from western Pennsylvania mines to Lake Erie ports. This loss of business, as between extremes, amounts to 34 per cent. Thus far in 1925, except for the coal shipped from the Steel Corporation mines, the tonnage originating in the Pittsburgh district is practically negligible.

ting coal to the consumer, the labor cost of mining, there is no such fair tribunal. In the non-union mines the wage is set by the price of coal, limited only on the bottom of the scale by living costs. In the union fields the wage is set by contract with one organization, the International United Mine Workers of America.

Within the non-union areas the process of elimination of the unfit, the deflation of the coal industry is presumably proceeding apace. Some are falling by the wayside, but on the whole, since the non-union fields with substantially lower costs are getting the major portion of the going business, they are in a stronger position than the union fields. Ability to compete, that is in costs of production, put the union fields in a class by themselves. The union fields as entities are being eliminated.

We thus come to the crux of the whole problem. We recognize the fact of overdevelopment; we know the only method by which that overdevelopment can be reduced to such a reasonable point that those surviving may have hope of profitable operation of their mines but we find that by reason of a fixed, inelastic, high wage scale in the union fields, these fields are marked for elimination by reason of that very fact. Let us now examine some of the evidence.

Perhaps the figures for the Pittsburgh district will bring the subject nearer home. Commercial operators, members of the Pittsburgh Coal Producers' Association, produced in January, February, March and April of 1923, 5,460,000 tons; in the same four months of 1924, 4,383,000 tons; and in the same period of 1925, 3,650,000 tons. The decrease this year below 1923 was 1,810,000 tons or 33 per cent. The drop from last year was 733,000 tons or 17 per cent. In May of this year production by these companies was 335,483 tons compared with 878,000 tons in May of 1924 and 1,620,000 tons in May of 1923.

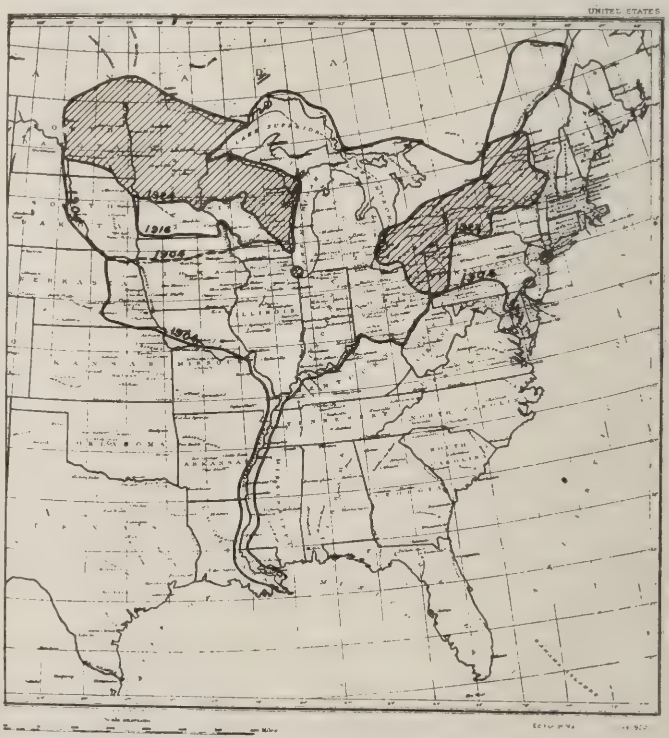
To help correct this situation the union operators would like to have the miners agree to a revision of the wage scale. It must be clear, from what has preceded, that if this district had a lower cost it could sell more coal; with the $5 basic wage of the November, 1917 wage scale, this district could secure its share of the going trade, which is not by any means inconsequential.

The stock argument of those who oppose such a revision is that it would be of no avail. It is contended first that there is no market for coal at any price, and second, that if the miners on the high scale should accept a reduction to the November, 1917, level, the operators in the non-union fields would cut their rates still lower and thus nullify any advantage of a cut here.

If that were substantially true it would be a pertinent argument. If the other fields could follow down any reductions in the union fields then it would be a hopeless matter for this field. That is not the case, however. A few there are among the non-union producers who have not cut to the bone, but they are few and far between.

Remember that since the present active competition began early in 1924, the non-union operators have been fighting among themselves for the business—not only for their own trade but for the union operators' normal trade. This fight has been fast and furious. They have already gone the limit in cutting wages and prices. The competition among themselves has long since resulted in wage scales representing rock bottom levels. Only by keeping their mines in full operation six days a week, have they been able to hold labor at those low rates.

The non-union wage situation is sensitive. Recall the history of last winter in the Connellsville region. Independents had cut wages in the summer of 1924 but the Steel Corporation had not. In the winter there was a flurry in demand for labor. Up went the wages of the



**Shrinkage of Pittsburgh District Markets**

Twenty years ago Pittsburgh seam Youghiogheny gas coal was the widest known standard, high-volatile coal in the United States. It was marketed by the million of tons down the Mississippi Valley to New Orleans. It was used in St. Louis gas plants. It was sold through the Midwest and Northwest and throughout the East. It shared the New England market with Irwin basin gas coal from the same Pittsburgh seam. But its frontiers have been driven steadily back. The line shown here for 1924 is not a solidly held line. Non-union coal is filtering through in every route.

independents to be reduced again in a few months after the flurry was over.

Competition and the survival of the fittest throughout the soft coal industry can be resumed when the union fields can meet the wage competition of the non-union fields, not until then, and a cut to the wage level of November, 1917, will do the trick.

It is argued that combinations among the operators, the banding together of many smaller union operations with few large corporations is the solution for the union fields. Adequately financed, such large companies may be able to weather the depression to better advantage than smaller concerns, but they cannot produce coal cheaper. Those who look to combination as a solution are dreaming of strength to put the price up. And how can they do that with the disparity in labor costs with the South? How, for instance can a combination of independents in the Pittsburgh district increase the price of coal? And how can it otherwise make a profit against non-union competition?

Again it is argued that the coal operators should modernize their mining practices; that if the coal producers would use loading machinery they could cut costs without cutting wages. It is hardly necessary to advise mining engineers of the progress that is being made in that direction or of the practical difficulties that beset every installation of loading machinery or face conveyors. Time and money will mechanize coal mining, but don't forget that the non-union fields can be and are as active in that direction, in fact more active, than the union fields. The non-union operator has no union to fight when he installs labor-saving machinery.

When a business concern finds itself unable to sell its goods, when the market price drops and a huge inventory remains, that concern either cuts the price and stays in the market, or it goes bankrupt. The union coal industry—operators and miners—are in that condition now. The union theorizes about the situation. The operators are dealing with it in a practical way. The operators tried alone to handle the situation in 1924. They failed. The union refuses to co-operate this year.

---

# Should Anthracite Miners Ask Higher Wages?

## Their Pay Rose 192 per Cent in 10 Years Without Decreases Shown in All Other Industries, Says the National Industrial Conference Board After Survey

WITH THE PRESENT wage contract between the anthracite mine operators and the United Mine Workers of America expiring on Aug. 31, this year, considerable interest attaches to a study of wages in the anthracite field made by the National Industrial Conference Board, 247 Park Ave., New York.

If the mine workers insist upon further pay increases on expiration of the existing contract, which was arrived at in 1923 after a five months' strike in 1922, they will do so in face of the fact that their wages have risen considerably more during the past ten years than those of workers in the manufacturing industries, the railroads or the public utilities.

Anthracite mine workers' average hourly earnings, according to the Conference Board's analysis, from June, 1914, until December, 1924, have risen 192 per cent; hourly wages in twenty-five basic manufacturing industries have increased during the same period only 129 per cent; hourly earnings of workers on Class I railroads, 141 per cent; those of workers in illuminating gas plants, 111 per cent, and in electric light and power establishments, 121 per cent.

The wage study covers 140 collieries employing 96,226 wage earners, a group including approximately 62 per cent of the total number of workers in the industry. It is the latest of a series of surveys of anthracite mining wages, the first of which covered wages as of June, 1914, followed by other studies of anthracite wages as of October, 1920, March, June and October, 1921, and of July and December, 1923.

COPYRIGHTED BY NATIONAL INDUSTRIAL CONFERENCE BOARD, INC. NEW YORK CITY

**Hourly Wages in Four Industrial Groups**

This illustrates the increase of wages in anthracite mining as compared with fluctuations in railroading, manufacturing and building in the United States since July, 1914.

While other industrial wages decreased somewhat since the peak year, 1920, it is significant that wages in the anthracite mines show practically no recessions, increasing steadily from pre-war days, when the average hourly wage was 28.4c. to December, 1924—the month upon which the present study is based—when the hourly earnings per worker averaged 82.9c. Hourly earnings of contract miners, who, however, make up by far the largest single group, showed an even greater increase, reaching $1.20 in December, 1924, a total net gain of 194 per cent over June, 1914.

With the exception of contract miners, a slight decrease was suffered by anthracite workers between December, 1923, and December, 1924, the composite figure for all anthracite wage earners other than contract miners' laborers dropping from 83.2c. to 82.9c. per hour.

The average daily earnings, or earnings "per start," of contract miners do not show as large an increase for the ten-year period since pre-war days, owing to the shortened working hours. However, the anthracite mine workers, who in June, 1914, drew an average of $3.46 per day, when the day averaged 9 hr., now draw an average of $9.11 for a day averaging 7.6 hr., representing a gain of 163 per cent in earnings per start. Average earnings per start from December, 1923, to December, 1924, increased from $9.05 to $9.11.

The increase in "real" earnings, that is of wages in terms of purchasing power, owing to the increase in cost of living, of course, is somewhat less than the increase in money wages. However, average "real" hourly earnings of all anthracite mine workers in December, 1924, show an increase of 76 per cent over those of pre-war days, as against an increase of 45 per cent in real hourly earnings of railroad workers, and a 38 per cent increase in real hourly earnings of wage earners in manufacturing industries.

Real earnings per start (or day) of contract miners were 58 per cent higher in December, 1924, than in June, 1914.

In a way, the results of the different surveys referred to are not strictly comparable since they are not based throughout upon returns from identical operating units. To compensate for this, the figures are weighted.

The weighting was on the following basis: It was assumed that because of the broad coverage of the first study, the totals in that study represented the normal proportion of each class of worker in the average operating company. This proportion was obtained not as of one month, but the average of the five periods covered was taken, in order to allow for any seasonal differences which might exist. Consequently, in arriving at the four composite averages, (1) all wage earners, less contract miners' laborers; (2) all wage earners, less contract miners and miners' laborers; (3) all inside, less contract miners' laborers; (4) all outside labor, a weight was given to the earnings of each class of labor included in each group, equal to the representation of that group as ascertained by the method described.

This prevented an unduly large proportion of certain types of labor in the companies reporting for any one of the surveys from carrying too much weight in arriving at composite figures for the industry or group.

Average hourly earnings of contract miners' laborers, Dec., 1924 = $0.914.

Prior to the present study, contract miners' laborers were not included in the tabulations. So many companies reported data for this group in the present survey that the average hourly earnings of the group were computed, but because of their absence from earlier studies they could not be included in the composite averages for December, 1924. Otherwise figures for that month would not be comparable with those for earlier periods. Consequently, the hourly earnings of contract miners' laborers for December, 1924, are shown independently.

Contract miners are the most important group of anthracite labor and in their case the earnings per start have also been computed. This appears to be a more satisfactory method of arriving at a measure of actual earnings than to attempt to compute average weekly earnings, since there is considerable controversy over the best method of arriving at an accurate figure for weekly earnings in this industry. This is due to the frequent changes in personnel between mines so that although a man may have been employed almost continuously during a pay period, he may have appeared on two or more payrolls, and it is manifestly impossible to trace each man through the various payrolls to arrive at his actual earnings for the period. In the few cases where the hours of the contract miners were not given, the contract miners' starts were multiplied by 7.6 to obtain the actual hours. In some instances contract miners' starts were not given and in such cases the contract miners' hours were divided by 7.6 to obtain an estimated figure on contract miners' starts. The figure 7.6 was used because according to the latest available study of the anthracite industry by the United States Bureau of Labor Statistics, contract miners averaged 7.6 hr. per start or per day worked.

# Graphic Charts Enable Mine Heads and Higher Ups to Watch Every Factor in Coal Costs

### Mining Needs Intelligent System of Checking Items as Total Cost Is Not a Reliable Criterion — Graphs Make Comparison Easy and Disclose Exact 'Sore Spots'

**By W. L. Affelder**[*]
Pittsburgh, Pa.

**W. L. Affelder**

SELDOM, if ever, has any industry been in a state that required as *intelligent* cost reduction as the coal industry demands at the present time. The word "intelligent" requires special emphasis, because cost reductions in this industry are too frequently made without proper regard for the resultant condition of the property and are often effected without adequate knowledge concerning what particular elements constituting the total cost are at fault. In this discussion, it is my intention to confine myself almost entirely to that portion of the cost of production covered by payroll labor.

It might be well to state that inasmuch as I am not an accountant, but am in active charge of the operating details of twenty-three bituminous coal mines, located in six Pennsylvania counties, this subject will be treated from an operating, rather than an accounting standpoint.

Too many operating officials fail to look beyond their *total labor cost.* If a mine produces the same tonnage in two cost periods, and in the latter of the two does so at a decline of say 5c. per ton, the satisfaction occasioned by this accomplishment too frequently prevents that minute degree of cost analysis which a corresponding increase would have occasioned. Such reductions in total labor cost may have included gratifying decreases in some of the constituent items and entirely unwarranted increases in others, which, on account of the resultant aggregate having been lowered, were overlooked.

Inasmuch as each of our mines submits a semi-monthly distribution of payroll, along lines suggested several years ago by the National Coal Association, on sheets made up as shown in Fig. 1, data are readily available from which to tabulate semi-monthly labor costs under the captions of "Mining," "Yardage & Deadwork," "Timbering," "Drainage," "Ventilation," "Haulage & Hoisting," "Tipple," "Preparation," "Railroad Car Loading & Yard Expense," "Structural Maintenance & Repairs," "Equipment Maintenance & Repairs," "Sundry Labor," "Superintendence," "Mine Office," and "Power Plant."

The figures constituting these fifteen sub-divisions, as well as the tonnage and total costs, for 23 mines, were so numerous and confusing that it was found impossible to appreciate their value properly during a semi-monthly period alone, to say nothing of being able to benefit by comparing them with previous costs, under similar conditions as to outputs and wage rates. It was, decided, therefore, at the beginning of the year 1924 to plot all semi-monthly labor costs on graphic charts especially designed to serve for a period of three years. These charts are 12¾ by 22 in. in dimensions, with the horizontal and vertical spacings ¼ and ⅛ in. respectively. Outputs are plotted 1,000 tons to the space, total labor costs 5c. to the space, and the various sub-divisions 1c. to the space. The charts are ordinarily "white prints" made in our own blue print room.

At mines where explosives are furnished free and where an adjustment in the mining rate is made to offset their price, an item of "Free Explosives" cost is also shown, and is included in the "Total Labor Cost." Under the "Haulage & Hoisting" sub-division, "Animal & Motor Haulage" is shown separately, as well as being included under "Haulage & Hoisting."

## CHARTS KEPT UP TO DATE

As all figures used on the charts had to be prepared even for the inefficient method of cost interpretation already in use, little additional work and no extra expense was incurred by the adoption of the charts. It goes without saying that much of the value of any comparative cost system depends upon the promptness with which the necessary data are available. Charts, therefore, are extended as soon as possible after the middle and end of each month.

In order to make this discussion practical, I will confine myself almost entirely to certain analytical discussions of payroll costs of some of our mines, using actual reproductions of our cost charts with only the names of the mines and the total cost scales eliminated. Actual letters passing between our operating officials will be used to illustrate the manner in which costs can

---

This article is an abstract of paper delivered before the American Mining Congress, Cincinnati, Ohio, May 28, 1925.

[*] Assistant to the President, Hillman Coal & Coke Co.

readily be interpreted, and, if necessary, corrected. Certain vertical lines on these charts have been made heaiver than others, thus rendering it easier to follow the discussion. Mines will be designated by number instead of by name.

Fig. 2 is a reproduction of the cost charts of "Mine No. 2." On March 11, 1925, the assistant general superintendent wrote to the superintendent of this operation as follows:

"I have before me the graphic cost charts for your mine for the period ending Feb. 28.

"I note that your production for the period ending Feb. 28 was approximately 4,000 tons under the production for the period ending Feb. 15. With this reduction in tonnage, you were able to hold your Total Labor Cost at approximately the same figure as for the period ending Feb. 15.

"Your cost, however, is still considerably higher than it was during the months of June, July, August, and September, 1924, when the production was much under that for the period ending Feb. 28 of this year.

"Yardage & Deadwork cost for the period ending Feb. 28 shows a decrease of approximately 2c. per ton from that of the period ending Feb. 15. Timbering, Drainage, and Ventilation have shown practically no change this year.

"Haulage & Hoisting costs for the period ending Feb. 28 show a slight increase over the period ending Feb. 15. This particular division of your costs has increased slightly over 6c. per ton since the first half of January of this year, and should receive vigorous attention. Costs must be carefully watched and reductions made where possible."

On April 2, 1925, he wrote the superintendent as follows:

"The graphic cost charts for the period ending March 15, 1925, show that with an increased production of approximtely 1,200 tons over the previous period, you were not able to make any reduction in your labor cost, but show rather an increase of 1c. per ton.

**Fig. 1—Form Used in Making Semi-Monthly Distribution of Pay Roll**

Fifteen subdivisions of the expense of coal production are here shown. These furnish abundant data for plotting the curves that show at a glance just how the various items rise or fall. Tendencies or trends thus are discernible immediately and faults may be corrected before they gain momentum

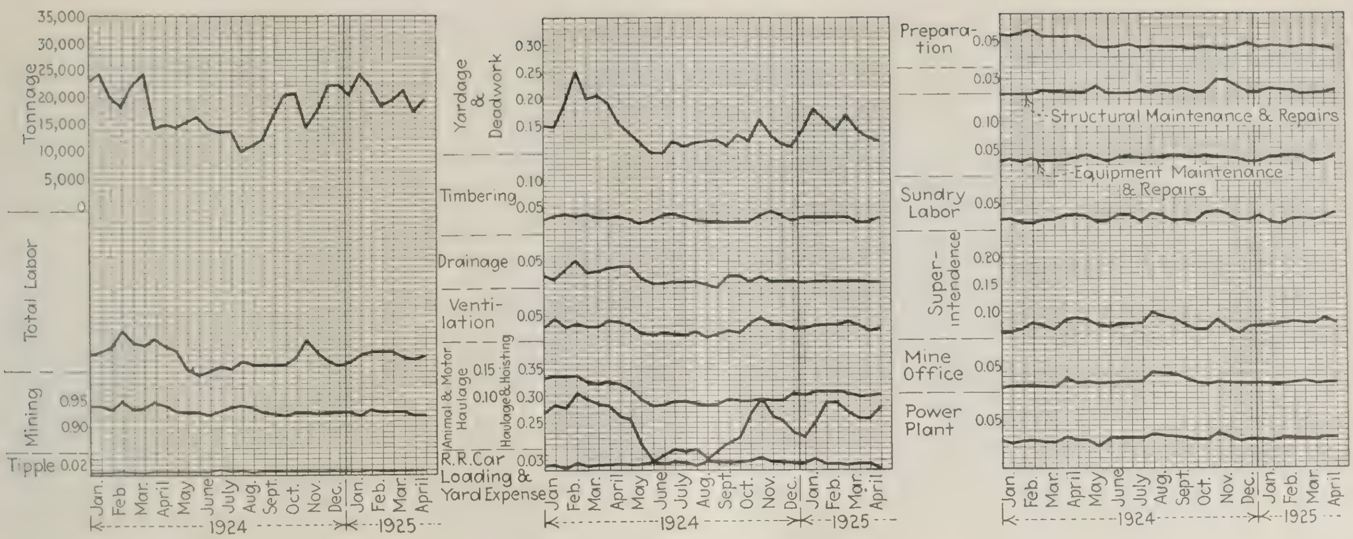

**Fig. 2—Costs at Mine No. 2**

These charts enable the assistant general superintendent, as brought out in the correspondence in this article, to place his finger at once on the exact items that showed unwarranted increases in costs.

"A reduction of approximately 2c. per ton in your Haulage & Hoisting cost was more than offset by an increase of 3c. per ton in your Yardage & Deadwork cost.

"Please watch your costs carefully and make every possible reduction."

On May 9 I wrote to the general superintendent and the assistant general superintendent as follows:

"It is disappointing to note that the labor cost at Mine No. 2 in the second half of April was $0.020 higher than in the first half of April in spite of the fact that the tonnage increased 14 per cent. It is true that although the tonnage was the same in the last half of April as in the first half of March, 1925, and in the first half of February, 1924, the labor cost was $0.060 less than in the first half of March, and $0.110 less than in the first half of February, but this does not seem to be any justification for the increase as shown between the two halves of April.

"Although decreases occurred in a number of the sub-divisions, I wish to call your special attention to the following increases: Timbering $0.008, Ventilation $0.006, Haulage & Hoisting $0.020, Equipment Maintenance & Repairs $0.006, and Sundry Labor $0.008. Please investigate these increases."

"Increases are especially acute in Yardage & Deadwork, Timbering, Drainage, and Haulage & Hoisting. This is one of the few mines which shows a very marked increase in cost since the advance in wages, as compared with the cost under the same scale of wages early in 1924."

Attention is especially called to the fact that in spite of a marked decrease in tonnage in the four semi-monthly periods which preceded the next wage scale reduction, a reduction in labor cost of 15 cents was accomplished between the first half of January and the first half of March.

Fig. 3 is a reproduction of the cost charts of Mine No. 5. Here wages were reduced to the 1917 scale on May 27, 1924, the 1920 scale was restored on Dec. 16, 1924, and the 1917 scale re-established on March 16, 1925. Charts are exceedingly valuable in comparing costs under such fluctuations in wage scales. A discussion of the costs of this mine are especially interesting because replies to letters calling attention to increases are submitted. Early in February, 1925, I wrote to the operating officials of the district in which this mine is located as follows:

"Mine No. 5's cost for the second half of January does not compare favorably with the first half of May, on the same scale of wages, as the increase in cost for exactly the same tonnage is $0.060.

"I wish to call your attention especially to an increase in Timbering cost from $0.095 to $0.125, in Mining cost from $0.617 to $0.646, (probably due to a drop of nine points in the wagon), and in Haulage & Hoisting cost from $0.312 to $0.409, part of which, at least, probably is due to the haulage extension work now under way."

The assistant general superintendent replied with the following letter:

"Replying to your memorandum regarding Mine No. 5, I beg to state that I have gone into the matter in detail with the superintendent.

"We compared the costs during the first half of May with those in the second half of January, and found that in Timbering the increase was due entirely to the employment of additional timbermen, made necessary by the intensive work that was done in C Flat.

"Mining costs increased from $5,836.95 to $6,375.44, largely on account of the increase in the amount of pick coal.

"Haulage & Hoisting increased from $2,946.76 to $4,036.74, on account of an increase in drivers from $922.97 to $1,114.57, plus $58.16 for men employed in breaking in stock. The use of so much new stock resulted in a decrease in efficiency of both drivers and horses. There was an increase in the cost of snappers from $7.55 in May to $85.87 in January, due to the fact that last May the boss driver was helping out with the work of the snappers, whereas in January he was not able to do that work.

"Cleaning Roads increased from $32.75 to $128.67.

"Haulage Repairs increased from $27.20 to $1,024.45. The new haulage road was accountable for $852 of this increase. This new haulage road will soon be completed, and as the day force has been reduced and the weight of the wagon increased, the costs in the immediate future should be considerably better than those that were mentioned in your memorandum."

It is needless to state that the preparation of the foregoing reply entailed such a thorough investigation

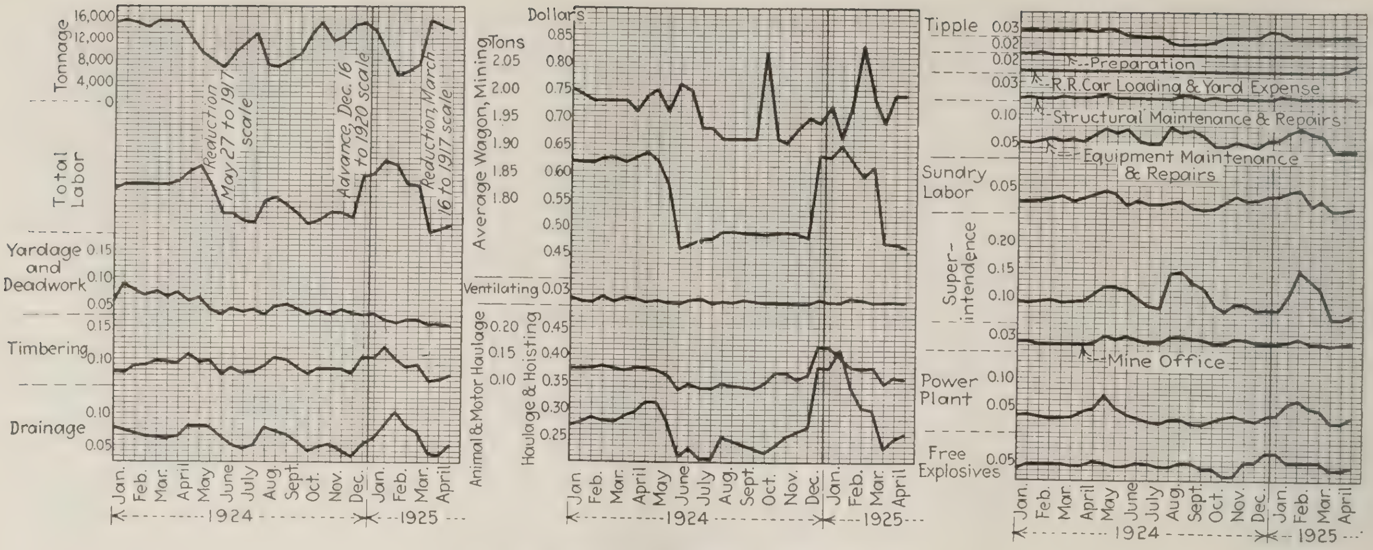

Fig. 3—Fluctuating Wage Scales Charted

Even though the scale of wages changed several times in a few months, yet costs under the different rates are entirely comparable. Note in the accompanying correspondence how quickly an increase of 6c. in total cost was traced to its two chief constituent elements of mining and timbering. In self defence the superintendent had to seek the reasons for these increases and when found it required but little time for him to have them properly adjusted.

of the cost at this mine from many angles, that the eyes of both the assistant general superintendent and the superintendent were opened to possible reductions in expense. That the investigation bore fruit is evident from the fact that, although the tonnages in the remaining three semi-monthly periods under the then existing wage scale were considerably less than in the last half of January, there was a continuous reduction in the total labor cost, aggregating 23c. Not a single sub-division mentioned in my letter failed to respond well to the corrective treatment to which it was subjected.

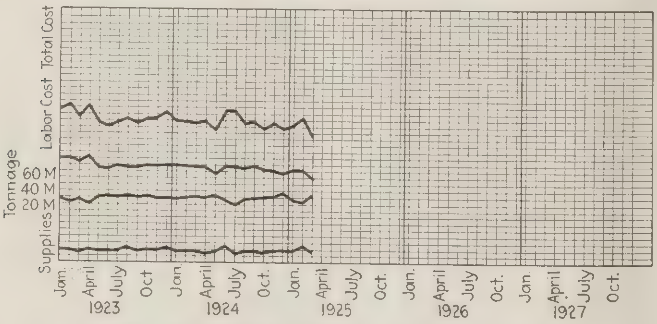

Fig. 4—Five-Year Monthly Cost Chart

This is intended for an entirely different purpose from the previous graphs. Although it may be used for other purposes, it is particularly useful in estimating what price must be obtained in order to make a profit when production is at any certain rate.

In spite of the consistent reduction in Total Labor Cost, I found it necessary in the latter part of April to write as follows:

"Mine No. 5 in the first half of April had practically the same tonnage as in the first half of December and in the last half of October, but it is interesting to note that the total labor cost in the first half of April was $0.110 less than in the first half of December, and $0.080 less than in the last half of October.

"The Haulage & Hoisting sub-division, however, is $0.011 above what it was in the last half of October. It seems to me that this former figure should be duplicated."

The reply to this letter read as follows:

"In the first half of April, Haulage & Hoisting cost, $3,567.71, compared with $3,823.59 in the first half of December and $3,425.10 in the second half of October. A large part of the increase in April as compared with October is accounted for by the fact that Motor Haulage Repairs increased from $14 to $528.88, due to the construction of the new haulage road to the North headings. Other sub-divisions of the cost are more in keeping with what might have been expected, although Pit Car Repairs increased from $116.10 to $200.75, and Drivers from $1,095.07 to $1,159.47."

Even though the principal item of increase, namely, the construction of an authorized haulage extension, was an entirely legitimate expense, the investigation disclosed an increase in expense for Animal Haulage, which is now well on its way toward correction.

A more recent letter regarding the same plant, dated May 9, 1925, reads:

"Although Mine No. 5 had practically the same production in the last half of April as in the first half of December, the labor cost dropped $0.070 per ton. In view of this drop, how do you account for the fact that the Drainage cost increased $0.020?"

This letter emphasizes my earlier statement that even with favorable reductions in Total Labor Costs, unfavorable increases in certain sub-divisions can only be detected by proper means of comparison and interpretation.

I might continue with a burdensome number of actual illustrations of the method of cost analyses under consideration, but I feel that sufficient examples have already been given regarding payroll costs. The impression should not be gained that this system entails a great multiplicity of letters. On the contrary, weaknesses are detected so readily and so specifically that correspondence is reduced to an absolute minimum. Most of the investigations made necessary by the apparent irregularities in costs are taken up by the operating officials directly with the superintendents on their numerous visits to the plants.

An entirely different type of graphic cost chart, designed to cover a period of five years, in monthly intervals and showing Supplies, Labor, Total Cost (including all overhead expenses) and Tonnage, can be made to serve many useful purposes. These charts are made 10 by 18 in., with ⅛ in. vertical and ¼ in. horizontal spacings. Fig. 4 shows a reproduction of such a chart.

An inspection of this chart reveals, among other things, that the total cost for July, 1924, for a production of 19,000 tons, was about 40c. per ton higher than in March, 1925, when the production was approximately 33,000 tons. These charts are of great value in conferences between the operating department and the sales department when the question comes up, as it frequently does, as to what selling price must be approached with a mine operating at a certain tonnage. On the theory that "what man has done, man can do," the operating department is able to predict with a fair degree of accuracy, where the dividing line between profitable and unprofitable business lies.

There are many other ways in which graphic charts can be used to advantage by operating officials as an aid in controlling, through proper interpretation, their costs. The method of application will necessarily differ somewhat with the individual problems of various companies, but the construction and use of graphic charts is simple enough to enable any operating official worthy of the name, to obtain surprising benefits from them.

---

# Combination Loader Reduces Breakage at the Tipple

### Arrangement Provides for Putting Coal Into Either Box or Flatcar—Improves Preparation in Highly Competitive Field

**By Charles M. Schloss**
Denver, Colo.

In the Rocky Mountain region competition is keen and as a result coal preparation is exacting. The plant of the Sunnyside Coal Mining Co., Strong, Colo., was considered a fairly efficient preparator, but difficulty was experienced in loading the lump product. Separation into the various sizes was made on a horizontal screen, open-top cars were loaded by means of a curved, hinged, telescoping chute on a comparatively slight inclination and closed cars were filled by a steep chute delivering to a box-car loader. The open-car equipment was set on approximately the critical angle for the material handled and as a result the coal sometimes required "bucking." The box-car chute, on the other hand, was so steep that the lumps attained high velocity in their descent and struck the side of the box-car loader with such force that many of them were shattered, thus nullifying the effect of the screening that previously had been administered.

After careful consideration by officials of the company it was decided to remedy these evils. Accordingly, a loading boom was installed. This device, which is the invention of Glenn A. Knox, superintendent of the Gunn Quealy Coal Co., is intended to load both open-top and box cars on the same track. It much resembles an ordinary boom except that it is mounted on a universal joint at the screen end and suspended from a trolley at the delivery end. This arrangement permits not only a raising or lowering of the delivery end but a swinging of the entire boom from a position parallel to the loading track to one extending diagonally across it.

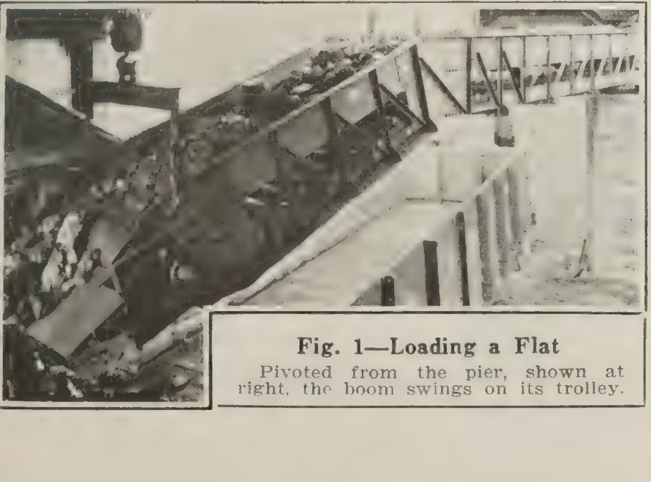

**Fig. 1—Loading a Flat**

Pivoted from the pier, shown at right, the boom swings on its trolley.

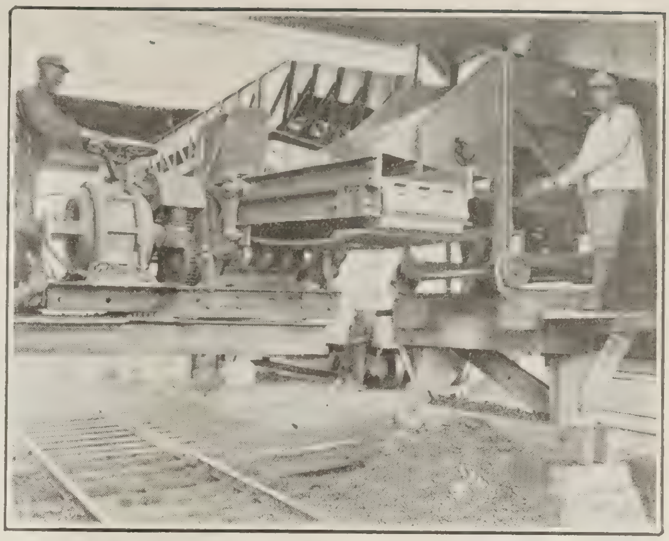

**Fig. 2—In Position to Load a Box Car**

When a closed car is to be filled the box-car loader is pushed through the car door in the usual way. The boom is swung to a position parallel to the lump track discharging to the short transverse conveyor. This latter is pushed forward on its rails until it will deliver to the box car loader which is pedestalled on the opposite side of the car. Note the small coal on the ground. This drops through a narrow opening between the transverse conveyor belt and its delivery plate. This opening thus frees the large coal from small pieces that may have ridden the lumps across the screen. Supt. R. T. Bell, boss of the mine at Strong, Colo., where this installation was made, stands at the right.

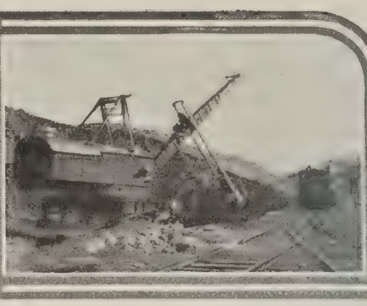
The Sunnyside installation consists of a Knox boom 36 in. wide and 37 ft. 6 in. long between centers. This is supported at its delivery end by a 4-ton hoist on an I-beam trolley. A right-angle chute attached to the end of the main screen delivers the coal to the boom with a minimum drop.

### Method of Loading Box Cars

When loading box cars the boom is swung to a position parallel to the track and delivers to a short transverse conveyor which extends into the car, there discharging its burden to the box-car loader. The transverse conveyor is supported on wheels and may be moved forward or back by the operation of a hand crank.

As is well known, passing coal over a screen does not give perfect sizing, as some small pieces will invariably "ride" the lumps and be delivered with them. At Strong, measures have been taken to surmount this difficulty. The plate on the discharge end of the transverse conveyor is placed with its edge about 1 in. from the apron where it rounds the head sprockets. Any small material accompanying the lumps falls through this opening into a chute and is delivered onto the ground outside the car. A test showed that three tons of fines were thus removed from the lump in the course of a day's run, the capacity of the mine being 600 tons. An elevator and bin are being installed to take care of this material.

# News Of the Industry



## Lewis Threatens Nationwide Strike To Enforce Jacksonville Agreement; Will Refuse Cut in Hard-Coal Wages

Scranton, Penna., June 30.—A national suspension of coal mining to bring about the enforcement of the Jacksonville agreement of 1924 in the bituminous field was threatened today by John L. Lewis, international president of the United Mine Workers, in his first address to the Tri-District Anthracite Miners' Convention in this city.

The International president enumerated three instances in which this three-year working contract was alleged to have been broken and scathingly condemned several of the nation's leaders of industry, who he declared were responsible for the abrogation of the contract. These were Andrew W. Mellon, Secretary of the Treasury and part owner of the Pittsburgh Coal Co., Col. C. S. Watson, former Senator, and John D. Rockefeller, Jr., of the Consolidation Coal Co., and Charles M. Schwab, president of the Bethlehem Steel Corporation, which controls the Bethlehem Mines Corporation. The three companies mentioned were charged by Lewis with "scrapping" the Jacksonville agreement, which he likened to Germany's treatment of the Belgian treaty. This agreement, which was signed by the union officials and operators in February, 1924, covered a three-year period.

The union chief declared that the Bethlehem, Consolidation and Pittsburgh companies have not only cancelled their agreement but have employed non-union workers to operate their mines. After reviewing the conditions Lewis declared: "If this situation continues it may be necessary at a later date to authorize a national shutdown of the mines of the country while the government, operators and miners discuss the question of the enforcement of the Jacksonville agreement."

This declaraton brought the convention to its feet in applause. The union leader in the course of his address made it clear that the anthracite workers would be firm in their refusal to accept any wage reduction. He discussed reports in the press to the effect that the anthracite operators would demand a 17 to 20 per cent reduction and declared: "Let me say now to the anthracite operators that the United Mine Workers of the hard-coal region will not under any circumstances accept a reduction of 17 or 20 per cent or of 1 per cent."

Further indication of the accepted belief that the anthracite mine workers, whose representatives assembled at the convention, will demand an increase in wages above the rates provided for in the present contract was manifested in a statement issued by Secretary-Treasurer Thomas Kennedy previous to the opening session. "I can say that sentiment is unalterably opposed to any backward step and is equally in favor of progress whenever and wherever possible," was Mr. Kennedy's statement to the press.

Following the opening convention formalities Chris. J. Golden, president of District 9, was elected temporary chairman of the convention. He was succeeded by International President John L. Lewis. Mr. Lewis was not present at the opening session.

The convention was addressed on Monday by Mr. Golden, Mayor John Durkan and a representative of a New York State labor college. A credential committee, composed of district union secretaries, was appointed, in conformance to custom. The business of the convention, that of formulating wage and working condition demands, will not be completed before Friday of this week, it is indicated. The convention will hear many speeches and motions and, as in the past, promptly forget them.

The scale committee, which will consist of the presidents, vice-presidents and secretary-treasurers of the three anthracite districts, and international officers, will be formally named in a day or two and it will prepare and present to the delegates the demands to be submitted to the operators. These demands will include a 15 to 20 per cent wage increase, a long-term contract and the "check-off." They will be met by counter demands from the operators for a decrease in wages of 10 or 15 per cent.

The negotiating parties will meet in Atlantic City early next week, probably Wednesday. It is generally understood that, in spite of demands to the contrary, the miners will be satisfied with a renewal of the present agreement; they will, however, make the "check-off" a prominent issue. On this phase of the negotiations the operators will manifest a united opposition.

### *Strike Settlement Urged By Empire Steel Corp.*

The British Empire Steel Corporation has submitted to James Murdock, federal Minister of Labor, a proposal for the settlement of the Cape Breton coal strike. The terms include a reduction of the 1924 wage scale by approximately 10 per cent and the abolition of the check-off system. The company states that it is ready to enter into a contract with the United Mine Workers on the understanding that no corporation official shall be required to meet an officer of the district board who is a Communist, a member of the Workers Party, or is known to profess Communistic principles and that none of the men who have been guilty of lawlessness will hereafter be employed by them in any capacity.

This proposal was submitted to the officials of District 26, U. M. W., and laid before the locals for consideration. Up to June 23, ten locals had voted to reject the proposal. At New Waterford the document was publicly burned. The New Waterford power plant, which was damaged during the fight between the police and the strikers on June 11, is again partly in operation, but it will be some time before it can operate at its normal capacity.

## Colorado Miners Still Work For Existing Scale

Miners in the northern Colorado fields will remain at work under the existing scale of wages until a definite decision is made by the Colorado State Industrial Commission. A cut in the day wages from $8.25 to $5.50 and in the pay of loaders of 10 to 15c. a ton recently was proposed by the companies, but definite action will not be taken until the case is reviewed by the commission.

It was reported that the mines would close following hearings on the new wage scale by the State Industrial Commission, but the companies state that if the mines are closed it will be due to a falling off of business and not to changes in the wage scale.

The northern Colorado coal fields include Boulder, Frederick, Erie, Lafayette, Louisville and Dacona, and approximately 2,000 miners are employed in this territory.

## Mining Men Urge Repeal of Hoch-Smith Resolution

Repeal of the Hoch-Smith resolution, passed at the last session of Congress, was demanded by representatives of the coal and metal mining industries in a meeting held at the Hotel La Salle, Chicago, June 23. About 40 men attended the meeting, which was called by James F. Callbreath, executive secretary, American Mining Congress, and agreed that the resolution condemned was an impediment to the efficient administration of the Transportation Act of 1920.

The Hoch-Smith resolution has been a storm center since its passage last January and many directly conflicting views as to its meaning have been offered. Apparently its intent is to have the Interstate Commerce Commission give full weight to the principle of what the traffic will bear and to extend special consideration to the rates on agricultural products.

In opening the meeting, Mr. Callbreath expressed the fear that the general inquiry begun under the resolution, *Rate Structure Investigation*, I. C. C. Docket No. 17,000, might result in increasing the rates on products of the mines. The resolution, he declared, asserted nothing new, but merely questioned whether the commission, in the exercise of its authority, was following the underlying principles of the organic law from which it derived its powers.

D. C. Yeats, Homestake Mining Co., said that the commission, upon learning that Colorado and New Mexico wanted to place their coal in the Dakotas, made such a move possible by increasing the rate on Wyoming coal. D. F. Hurd, secretary, Pittsburgh Vein Operators' Association; Jonas Waffle, traffic manager, Indiana Bituminous Coal Operators' Association, and C. J. Goodyear, commissioner, Pittsburgh Coal Producers' Association, all stated their desire to refrain from action till the purposes of the Interstate Commerce Commission were made plain.

After discussion the meeting passed the resolution urging Congress to repeal the Hoch-Smith resolution in the interests of efficient transportation, sound business and industrial development and that the proper administration of the Transportation Act be left to the Interstate Commerce Commission.

---

## Virginian Pier Starts Work

The new $3,000,000 coal pier of the Virginian Ry. at Sewells Point, Va., was formally opened by C. H. Hix, president of the Virginian, before about 200 spectators, June 2. The pier loaded 9,000 tons of coal in the American steamer Sewalls Point, for Boston, for demonstration purposes.

The new pier, regarded as the most modern in the world, has an hourly dumping capacity of 7,200 tons. It is operated by electricity throughout, electric trimmers eliminating much hand labor and speeding the service to ships. Two car dumpers are operated simultaneously, loading two ships at one time. The new pier is not being operated regularly, but is ready for use.

**Martin G. Bolt**

Martin Bolt, 54, of Springfield, Ill., state director of the Department of Mines and Minerals of Illinois, died June 23, after three weeks' illness following an operation. He began working in the mines at Oglesby, Ill., at the age of 12. For two years he was secretary-treasurer of the Ladd Local Union, United Mine Workers, and was later elected president of the local. He also was secretary-treasurer of the subdistrict union for two years. He became secretary of the Mining Board in April, 1907, under Governor Deneen, and remained in the department until his death. He was appointed director of the Department of Mines and Minerals Dec. 1, 1923, and was reappointed by Governor Small, the appointment being confirmed by the Senate only a few days ago.

---

## B. & O. Revenues Last Year Hurt by Coal Slump

The Baltimore & Ohio Railroad Co. reports total railway operating revenues for May, 1925, of $18,687,410, compared with $18,360,021 for May, 1924; operating expenses of $14,248,007, against $13,838,697, and net railway operating income of $3,184,866, compared with $2,389,509 the year before. The accumulation for the first five months of this year shows total railway revenues of $90,901,961, compared with $93,557,897 the previous year; operating expenses of $72,567,206, compared with $75,373,847 in 1924, and net railway operating income of $12,379,808, compared with $12,624,811.

The company's report for 1924 states that "With the exception of products of agriculture, which showed a slight increase, the decrease in traffic was general. Especially notable was the large decrease in bituminous coal, which is the largest single item of traffic handled by the company. The explanation for this decrease, however, lies in the fact that the bituminous coal industry in the Northern bituminous coal fields has been handicapped in the Eastern markets by the lower mining costs prevailing in the Southern Pocahontas, New River and other fields. This condition was partly offset by the company handling a larger proportion of coal traffic from connecting lines and finding a market for it on or via its lines. Notwithstanding the reduction in coal traffic, the revenues of the company were generally sustained owing to increased commercial and industrial activities in the territory served by its lines."

## Say Mines in Kansas Merger Are Overvalued

New figures on the valuation of the properties of nineteen coal companies in the Kansas-Missouri field, as a necessary step before a sale or merger of the holdings can be effected, were ordered prepared, at a meeting of the interested companies in Pittsburg, Kan., Tuesday, June 23.

W. C. Shank, prominent Pittsburg (Kan.) coal man, was assigned to make the new appraisement, with the power to choose assistants as he sees fit. Valuations already prepared, it was agreed, are too high in most instances, comparison of figures showing some to be out of all proportion to others.

As soon as the reappraisement is completed, another meeting will be called by Ira Clemens, Pittsburg coal operator, whose efforts have had much to do with bringing the scheme for a pooling of interests to a head and who is slated for president of the new company, to be known as the Basin Stripping Corporation.

From this second meeting is expected to come final action. Mr. Clemens said he was unable to state whether the plan finally will terminate in a merger, with all the companies retaining their interests under one management, or whether the original project of outright purchase by a single corporation would be carried out.

"Our object now is to get down to a definite working basis," Mr. Clemens said. "We cannot do that until we have the revaluation figures before us."

It is possible, he said, that the properties will be bought outright if the valuation figures are pared down to where they will appeal to Graham-Parsons & Co., of New York, proposed purchasing agents.

Mr. Clemens explained that although options to buy the holdings of the nineteen companies expire July 1, virtually all the companies have expressed willingness to extend the time of the options, if necessary. The first valuation figures were about 35 per cent too high, as reckoned by Leslie, Banks & Co., New York accountants, he said. Carefully prepared data show that the proposed merger would save 27c. a ton in the overhead expense of producing coal and would have much to do with restoring the Kansas coal market. First announcement concerning the consolidation was made in Chicago, June 18, following a series of conferences.

---

Class I railroads from Jan. 1 this year to June 1 placed in service 70,949 freight cars, according to the Car Service Division of the American Railway Association. This was an increase of 12,394 cars over the number installed during the corresponding period last year. Of the total number installed from Jan. 1 to June 1, this year, 25,117 were coal cars, or 6,295 more than during the same period in 1924. During the month of May alone, freight cars installed totaled 13,023, which included 4,313 coal cars. Freight cars on order on June 1 totaled 36,515, compared with 61,256 on June 1 last year.

## Gould Asks Co-operation To Increase Strength of National Coal Association

In addressing the New River Coal Operators' Association at Mount Hope, W. Va., Saturday night, June 27, Morton L. Gould, Indianapolis, made his first public utterance since his election, June 19, to the presidency of the National Coal Association. Mr. Gould sounded the keynote of his administration in these words:

"You and I know that frequently most auspicious occasions are not of our own design. They just happen—at the right time, at the right place and with the right people. Truly, it seems to me that this meeting is such an occasion. If it is within my power to rise to this occasion, my administration as the president of the National Coal Association will surely have been launched upon a sea of service with prevailing winds of certain promise that we shall reach our port.

"A fact always to be remembered concerning fundamental principles is that we are all in the same boat, which means that if an association of the far West, for instance, rocks the boat, the interests of West Virginia and other sections are jeopardized. If one association isn't keeping in stroke or isn't putting its very best prowess and technique behind every turn of the oars, 'the whole crew' suffers, in more or less degree.

"None of us, if we want to get anywhere, can 'paddle our own canoe' when it comes to national work. We all have our own local interests, but, if we attempted to operate on a national scale through the canoe method, we would soon be capsized.

"I trust this is not a mixed metaphor and that through this interpretation of a general truth I may give to the bituminous operators of the United States the real reason of by abiding conviction of the vital need for universal co-operation as regards all problems of nation-wide scope.

"Because this is the way I feel, I am here to extend offer of co-operation and make pledge of support. You, along with others, have asked me to be the captain of the crew and hence am I not justified in confidence that the New River operators, the operators of other sections of your state and those of other states will always keep in stroke?

"You appreciate the extent of the preliminary work involved in the formulation of a program looking toward the collection and dissemination of trade information. Work along this line is already under way in our Washington office and very shortly a meeting of a special committee will be called to whip preliminary plans into final form.

"Let me call to your attention the optimism of Robert K. Cassatt that this industry is headed for better times, and his assertion that the stronger we build the National, through increased membership and through deeper realization of the responsibilities of membership, the sooner will we come into our own. I can visualize the day when *every* bituminous operator will give financial support to the belief which all operators *now* undoubtedly share, namely, that the growth and the influence of the National have a *direct* bearing on the welfare of *each* operator. In the next twelve months I am going to induce as many people as I possibly can to translate belief into membership. I conceive this to be the duty of the president of this association. It won't be long, however, before this association will be all-embracing, and when that time comes the efforts of all can be devoted almost entirely to the definition and the conduct of constructive programs.

"Help me, will you, in every way you can to advance this effort? Lend me a hand in your own territory so we may recruit to maximum. Support me to the greatest extent in the National so our work may be productive of such substantial results as to win for this industry the place in the sun to which it is entitled. And ever remember that I do not chant empty words when I declare your interests are my interests and my time is as at your service."

## *Improvements on C. & O. To Cost $20,000,000*

The Chesapeake & Ohio Ry. plans expansion and development in Virginia and West Virginia and elsewhere, involving a total expenditure of $20,000,000. In addition the road is planning the construction of a new line of fifty-five miles from Stonecoal to Gilbert, W. Va., which will link up two important branches of the system and will open up new territory in the coal fields. One of the principal improvements, now actually under way, is the construction of a large freight terminal at Clifton Forge, Va. This will comprise a large receiving yard as well as a classification and forwarding yard for eastbound traffic.

Other items in the program include construction of a third track near Russell, Ky., and the construction of a large coaling station at that place.

## Russian Coal Output Gaining

Official figures of coal production in the Soviet Union in the first quarter of the current fiscal year ending Oct. 1 next, as received by the Russian Information Bureau in Washington from Moscow, show an increase of 7.4 per cent over the gross production for the corresponding period last year. The comparative figures of output are as follows, in millions of poods*:

| | 1st Quarter 1924-25 | 1st Quarter 1923-24 |
|---|---|---|
| Don Coal Basin .... | 154.5 | 135.4 |
| Moscow Coal Fields | 8.0 | 13.6 |
| Urals .............. | 20.0 | 17.3 |
| Siberia ............ | 18.0 | 20.4 |
| Total ............ | 200.5 | 186.7 |

*About sixty poods equals one ton.

The coal shipped from the mines during the quarter totaled 168,400,000 poods as compared with 116,900,000 poods in the same quarter last year.

## Indiana Coal Men to Fight Boost in Short-Haul Rates

Coal operators and Chamber of Commerce officials of Evansville, Ind., have joined hands in initiating a fight on the proposed 25 per cent increase in short-haul freight rates in Indiana and neighboring states.

At a meeting of leading operators of the southern Indiana district and the transportation committee of the Evansville Chamber of Commerce held in Evansville June 16, resolutions condemning the proposed increase were adopted and Leslie LaCroix, traffic manager of the Chamber of Commerce, was commissioned to present the matter at the rate hearing held before the Interstate Commission Commission at Indianapolis June 29. Authorization also was given LaCroix and a committee of coal operators and consumers to co-operate with other organizations throughout the state to defeat any increase in short-haul rates.

Those chosen to officially represent the coal interests of the state at the Indianapolis hearing are LaCroix, R. I. Pierce, traffic manager of the Terre Haute Chamber of Commerce; Jonas Waffle, Terre Haute, representing the Indiana Bituminous Coal Operators Association; R. B. Coapstick, traffic manager of the Indiana State Chamber of Commerce, and A. B. Cronk, Indianapolis, attorney for the Indiana Public Service Commission.

LaCroix was accompanied to Indianapolis by two southern Indiana operators, Walter Korff and E. J. Myerhoff, both of Evansville.

The proposed rates per ton are:

| | Cents |
|---|---|
| One to twenty miles................ | 75 |
| Twenty to thirty miles............. | 80 |
| Thirty to fifty miles.............. | 95 |
| The present rates per ton are: | |
| One to ten miles................... | 55 |
| Ten to thirty miles................ | 59 |
| Thirty to fifty miles.............. | 80 |

## Railroad Fuel Cost Lower

The cost of coal used by Class 1 railroads in locomotives in transportation train service during last April decreased from the average for the month before, according to figures prepared by the Bureau of Coal Economics of the National Coal Association from monthly reports to the Interstate Commerce Commission. The average cost per net ton for such coal for the entire country was $2.79; for the Eastern district, $2.85; for the Southern district, $2.34, and for the Western district, $3.09.

In comparison with March there is a decrease in these averages of 3c. per ton in the entire country; 1c. in the Eastern district; 7c. in the Southern district and 2c. in the Western district. These averages, however, when compared with those of April, 1924, show much larger differences. Thus for the United States as a whole there was a drop in the average of 40c. per net ton; in the Eastern district, 43c.; in the Southern district, 50c., and in the Western district, 22c. The term "cost," as used in connection with these figures, represents the invoice price paid by the railroads for the coal at the mine, plus freight charges paid, if any.

# Expansion of Statistics by N.C.A. Commands Widespread Attention; Weak Support from Union Fields

**By Paul Wooton**

Washington Correspondent of *Coal Age*

That prospects for thoroughgoing bituminous coal statistics never were brighter is the opinion of the staff of the National Coal Association and others who attended the convention in Chicago. The resolution concerning statistics hardly seems to convey the enthusiasm for the revival of statistical work that was indicated by the expressions of the individual coal operators in attendance. It reflects the thought of a conservative committee which believes in being slow and sure.

It will be recalled that the resolution adopted recited that the legality of collecting and disseminating trade information had been established by recent decisions of the Supreme Court and that a plan for the association's future statistical activities should be worked out by a committee and submitted to the Board of Directors. The executive secretary lost no time in choosing for this committee a list of operators especially familiar with the statistical needs of the industry. Some days must elapse before acceptances can be received and the announcement made. Some delay in getting the statistical work going will be occasioned because the Board of Directors will not meet until October.

There is little doubt, in view of the sentiment in evidence at Chicago, that the committee will advise the continuance of the statistical program which was just getting under way in 1920, when its progress was interrupted by the first of the trade statistics decisions. Some expansion of that program is probable but the policy will be to encourage the local associations, where needed, to strengthen their statistical work. From these various sources the National will recruit such figures as may be of countrywide interest.

The presence at the convention of C. P. White, of the coal division of the Department of Commerce, is an indication that the resources of the department can be counted upon for application to this program in so far as they are desired by the association. There already have been indications that the industry is desirous that the government continue the collection of production figures, an activity now likely to be conducted under Mr. White's direction in the Department of Commerce.

The convention served to emphasize strikingly that the National is not receiving the support from the union fields that it has reason to expect. Despite the fact that the preponderance of its support long has come from the non-union areas there has been no departure from the custom of awarding half of the offices and committee places to representatives of the union districts. This balance of control never has been disturbed and at this convention the association went to union territory for its president. In the selection of Morton L. Gould for that office the association chose a man who has been engaged uninterruptedly in the production of coal for thirty years. The scale of his operations has not been large, which means that he has kept in intimate contact with all the problems of production—experience frequently denied the presidents of larger companies.

No president of the National Coal Association has contributed more to organization than did the retiring president, S. Pemberton Hutchinson. Plans are in the making which will enable the association to continue to have the advantage of his active service.

There were encouraging membership additions at the convention and others have come in since. The large nonmember attendance at Chicago is thought to indicate the probability that further acquisitions may be expected.

Those in attendance liked the way in which the program was made up within the industry and the opportunities that were offered for discussion of the topics presented. There was general agreement that the program was one of the most successful ever staged by the association.

### Thirty-nine Organizations Present

The complete list of local associations and individual companies answering the roll call at the convention was: Alabama Fuel Association, Coal Operators' Association of Thick Vein Freeport Seam of Pennsylvania, Harlan County Coal Operators' Association, Hazard Coal Operators' Exchange, Indiana Bituminous Coal Operators' Association, Indiana Coal Producers' Association, Kanawha Coal Operators' Association, Logan Coal Operators' Association, New River Coal Operators' Association, Northeast Kentucky Coal Association, Northern West Virginia Coal Operators' Association, Operators' Association of Williamson Field, Pittsburgh Vein Operators' Association, Pocahontas Operators' Association, Somerset County Coal Operators' Association, Southern Appalachian Coal Operators' Association, Southern Wyoming Coal Operators' Association, Southwestern Interstate Coal Operators' Association, Tri-State Coal Stripping Association, Virginia Coal Operators' Association, Washington Coal Producers' Association, West Kentucky Coal Bureau, Winding Gulf Operators' Association; Chicago, Wilmington & Franklin Coal Co., Colorado & Utah Coal Co., J. K. Dering Coal Co., Doubleday Coal Co., Elk River Coal & Lumber Co., Gulf Smokeless Coal Co., Hillman Coal & Coke Co., Madeira, Hill Coal Mining Co., Miami Coal Co., Mt. Savage George's Creek Coal Co.; Rockhill Coal & Iron Co., Roundup Coal Mining Co., Sheridan-Wyoming Coal Co., Edward Soppitt & Sons, Spring Valley Coal Co. and Westmoreland Coal Co.

## I. C. C. Receives Few Ideas for General Rate Revision

Few suggestions, and none of them from any large organization, have been received by the Interstate Commerce Commission in response to its request for ideas as to how it should proceed with the study of the freight rate structure and make readjustments, as it is instructed to do under the Hoch-Smith resolution adopted by the last Congress.

Indications are that most of the interested parties, including the Commission, are at a loss to interpret the resolution. It was opposed, before adoption, by the Commission and vigorously opposed by the National Industrial Traffic League, which represents the large majority of shipping interests of the country, the latter's opposition being based on the ground that the resolution was an entering wedge for political rate-making.

The Traffic League has made no suggestions, thus far, to the Commission. Neither have the carriers. The National Coal Association, which is deeply interested in rate readjustments, has adopted a policy of watchful waiting. There is a widespread feeling that an effort will be made when Congress meets again to repeal or amend the resolution.

The resolution declares that "it is hereby declared to be the true policy in rate making to be pursued by the Interstate Commerce Commission in adjusting freight rates, that the conditions which at any given time prevail in our several industries should be considered in so far as it is legally possible to do so, to the end that commodities may freely move." Many observers believe that to make flexible rates, such as this would appear to mean, would be impossible. The resolution further instructs the Commission to make a study of the entire rate structure to determine various matters and in readjustments to give "due regard" among other factors to comparative market values.

## Finds Miners' Homes Below American Standards

The women of coal miners' families, their employment status, employment opportunities, and home and community environment are the subject of a report just issued by the Women's Bureau of the U. S. Department of Labor. This report, which is an analysis of data collected by the U. S. Coal Commission, reveals that with the exception of lighting facilities, which were fairly good in miners' homes, this was generally speaking not only *not* the case but that the home and community resources in both company-owned and independent mining towns were too often far below what are termed American standards.

Especially conspicuous was the lack of adequate water facilities. Over eighty thousand dwellings in 811 communities were covered in the investigation. Of these little more than one-fifth had running water, about 3 per cent had a bathtub or shower, and less than 0.4 per cent inside flush toilets.

While the anthracite region was far in the lead in the number of dwellings equipped with running water, "running water in the house," the report points out, usually meant one faucet in the kitchen, and the prevailing rates for additional faucets were so high as to penalize in an illogical and unnecessary way the use of labor-saving devices. For instance, the miner's wife might carry all the water she needed from the faucet to the stove, the tub, or the sink, but if she used the same amount of water, drawing it through another faucet, or through a hose attached to the kitchen faucet, additional charge would be made.

The sewerage system in the great bulk of the mining communities was totally inadequate, company-owned bituminous camps showing the worst record in this respect, with only 4 per cent of them having complete systems.

In the matter of community resources, outstanding facts shown by the investigation were that the majority of miners' wives and daughters were living in regions strikingly devoid of facilities which are necessary in the recreation and improvement for women — public parks, reading rooms, libraries, rest rooms and girls' clubs—and that most of the institutions that are considered as playing an important part in American community life usually were lacking in mining camps distant from towns and were absent also from many of the independent communities.

In a communication addressed June 25 to James J. Davis, Secretary of Labor, by Harry L. Gandy, executive secretary, National Coal Association, the statement is made that the report is solely designed to prejudice public opinion against coal operators.

"It is quite possible, as the Department of Labor notes, that in some coal mining communities, there is a shortage of 'public parks, reading rooms, libraries, rest rooms and girls' clubs.' However, actual comparison of living conditions in coal mining communities, on the one hand, with living conditions in agricultural or industrial communities, on the other hand, favors the homes of coal miners and reflects credit on the personal efforts of coal operators to promote the well-being of the miners.

"Let me call your attention to the following statement made two months ago by the Acting Director of the U. S. Bureau of Mines on the occasion of the issuance of an order eliminating the term 'mining camp' from the lexicon of the Bureau: 'The Bureau believes the term "mining camp" gives the public an entirely incorrect impression of conditions prevailing at points where coal is mined; in other words, that it is not a true picture, inasmuch as established communities, complete and attractive homes, with excellent educational facilities and fine sanitary conditions are to be found where coal is mined. The coal operators of this country are to be complimented for the real interest and personal concern which they evidence in the physical, intellectual and moral welfare of the miners and their families.' "

**Big Men of the National Coal Association Convention**

At the left is Gov. D. R. Crissinger of the Federal Reserve Board; in the center Harry L. Gandy, executive secretary of the association, and at the right Gen. Herbert M. Lord, director of the budget. The two government officials were prominent on the program.

## Shipping Board Bids Are Low

Bids opened at New York on June 23 and June 24 by the U. S. Shipping Board for furnishing and delivering coal to vessels in New York harbor are considered low for the quality required. The coal called for must be guaranteed by the bidder to be equal to or better in analysis than the following: Maximum volatile, 23 per cent; minimum fixed carbon, 69 per cent; maximum ash, 8 per cent; maximum sulphur 1.5 per cent; minimum B.t.u., 14,450 dry coal. The coal must contain at least 30 per cent lump.

Bids for supplying the "George Washington" with 3,500 gross tons were as follows:—W. A. Marshall & Co., $5.93 t.i.b.; Seiler Coal Co., $6.30 t.i.b.; W. H. B. Haff, $6.11 t.i.b.; Russell Norton, $5.99 t.i.b. On a net ton basis f.o.b. mine the bids ranged, approximately, from $1.92 to $2.27 per ton.

On 1,200 gross tons for the freighter "Anaconda" the following bids were received: W. A. Marshall & Co., $5.76 t.i.b.; Imperial Coal Corp., $5.47 t.i.b.; W. H. B. Haff, $5.92 t.i.b.; Seiler Coal Co., $5.93 t.i.b. On a net ton basis the range is approximately $1.65 to $2.05 f.o.b. mine.

## Strikers Burn Mine Works And Blow Up Ferry

Violence again broke out June 26 in the Pomeroy Bend (Ohio) coal fields, where union miners have been on strike more than a year and where several coal companies recently resumed operations under the 1917 scale. The outer workings of one of the mines was burned, a river ferry and an automobile were dynamited and lesser disturbances took place.

Fifty deputies were put on guard at the mining properties last Saturday and Judge Miller made permanent the temporary injunction against picketing of the mines by union workers.

The burning of the outer workings of Mine No. 17 of the Pittsburgh Coal Co., near Racine, formerly known as the Thomas Mine, occurred in the early morning hours. The destruction was complete, forcing indefinite suspension of work and causing damage estimated at $50,000. About 150 miners were employed at the shaft.

A few hours previously the ferryboat on which most of the miners employed at the shaft are transported across the Ohio from their homes in West Virginia was dynamited and sunk.

Common Pleas Judge A. P. Miller last week granted a temporary restraining order against picketing of three mines of the Pittsburgh Coal Co. and one mine, No. 7, of the Stalter Essex Coal Co., which have been operating in the Pomeroy field under the 1917 scale. This action followed many threats of violence on the part of union miners and was the culmination of a number of acts of violence. Among these was the blowing up of a launch which transferred miners across the Ohio River and the burning of the tipple at Mine No. 5 of the Stalter Essex Coal Co. Judge Miller had received a letter threatening that in case of an injunction his home would be dynamited. The order named Lee Hall, president, and G. W. Savage, secretary of Ohio District No. 6 of the United Mine Workers, as well as Rich Campbell, local president; William Fennell, A. N. Bengel, Robert Marshall and about 200 miners in the Pomeroy field.

# United Mine Workers Plan Extension Of West Virginia Strike Area in Campaign to Unionize Entire State

Is the Baltimore agreement a pact between the United Mine Workers and the Northern West Virginia Coal Operators' Association or is it a joker? Is the agreement still in effect if the officers signed for the association and not for individual companies? Is there an existing agreement, if the members withdrew from the association to clear their legal skirts and the association peters out of existence quietly with the union miners holding the bag? Have the United Mine Workers lived up to their gentlemen's agreement to completely organize northern West Virginia, and if they haven't made good why is any part of the agreement binding, although this phase of the question was never reduced to writing?

These and many other questions are being raised as a result of the labor controversy which started last week as to who actually signed the Baltimore agreement and who did not. The argument was started by the United Mine Workers when the organization printed a page advertisement in Morgantown, Fairmont and Clarksburg, with sections of the contract. The advertisement asks the pertinent question, "shall the coal operators treat contracts with the United Mine Workers of America as mere scraps of paper?" Then the charge is made that the following concerns abrogated their contract: Consolidation, Hutchinson, Fairmont & Cleveland, Edna Gas, Brown, Blockey-Pittsburgh, Dawson, Rosehill, Fairmont Big Vein, Fairmont-Chicago, Pittsmont, the Virginia & Pittsburgh Coal & Coke Co., Bethelehem Mines Corporation, Clark Coal & Coke Co., Jamison Coal & Coke Co. and Soper-Mitchell Coal Co.

An attack has been leveled at Frank R. Lyon, vice-president of the Consolidation Coal Co., in the advertisement, for a statement he made that the miners of the company have petitioned to return to work.

### Clark Denies Contract Break

According to John A. Clark, Jr., president of the Northern West Virginia Coal Operators' Association, "the men who signed that agreement were coal operators, but they were not at the meeting to represent their companies. They were there as the scale committee of the Northern West Virginia Coal Operators' Association. They signed the agreement as members of that committee and not as representatives of their companies. Consequently, what Mr. Bittner designates as 'abrogation of contract' was merely dropping of those various companies from the operators' association. The agreement was not signed between the United Mine Workers and the coal companies. It was an agreement between the association and the union. It was binding only as long as the operators stayed in the association and as long as the miners remained members of the union."

This opinion, however, is at variance with the statement issued by Van A. Bittner, chief international representative of the United Mine Workers, who comments as follows:

"Of the twenty-four men representing the United Mine Workers who signed the Baltimore agreement, only one was a representative of the international union and that was Percy Tetlow. The other twenty-three were officers of District No. 17, West Virginia, and members of the scale committee who worked in various mines in northern West Virginia.

"Mr. Clark says relative to his signing the Baltimore agreement, 'My act was in the manner of a notary public. I affixed my name to the document which showed that an agreement on wages had been reached between the United Mine Workers and the Northern West Virginia Coal Operators' Asociation. The agreement was signed by the scale committee of the association and by myself as president of the association.'

"This statement made by the president of the Northern West Virginia Coal Operators' Association proves to every fair-minded man in our country that Mr. Clark's company and the other coal companies mentioned have certainly abrogated their agreement with the United Mine Workers. Since Mr. Clark in his statement fully substantiates the position of the United Mine Workers, I have nothing more to say except that the fight in northern West Virginia will be continued indefinitely."

### Non-Union Output Climbs

Non-union coal production in the 12½ counties of northern West Virginia totaled 5,045 cars in the first four days of last week. On an average 155 mines worked daily. A new daily production peak of 1,267 cars of non-union coal was established June 23. With open-shop mines producing 653 cars a new daily coal loading record was attained along the Monongah Division, B. & O., June 22. While non-union tonnage was holding firm last week the daily union loading was of a downward trend; 835 cars of coal was produced by union mines in the first four days of last week. Ten mines were working on a union basis.

Extension of the organization of the United Mine Workers into southern West Virginia is being seriously considered and according to reports preliminary arrangements were made for the proposed organization campaign at a meeting held in Charleston early last week. Further plans were made at a conference held in Philadelphia on Monday, June 29, attended by International President John L. Lewis, International Vice-President Philip Murray and International Secretary and Treasurer Thomas Kennedy, as well as W. A. Glasgow, chief counsel for the union, and attorneys Henry Warrum, T. C. Townsend and Earl E. Houck.

Definite plans were considered at the meeting for the issuance of a general strike call of all the non-union miners in the entire State of West Virginia.

### *Edmonton Miners Strike*

Coal miners of the Edmonton district in Canada voted on June 28 to strike on July 1. Their contract with the operators expired on the night of June 30. In some of the other districts of western Canada the men have accepted reductions in wages.

Especial attention will be given to the prosecution of the strike in Logan County. Just when this strike order will be issued was not definitely determined. That is a matter that will be left entirely in the hands of International President John L. Lewis.

A great number of miners in northern West Virginia who are working in non-union mines have informed the officers of the organization that just as soon as they receive a pay they will again join the ranks of the strikers. The conference in Philadelphia was intended to mark the beginning of the greatest drive the United Mine Workers has ever made to thoroughly organize the entire State of West Virginia.

The South Penn Coal Co., in the Scott's Run section, resumed operation under the Baltimore agreement last week, according to reports.

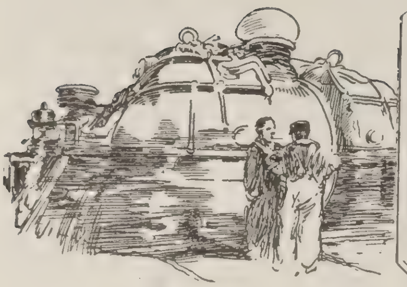
Toward the close of last week the Consolidation Coal Co. was producing 3.500 net tons of coal a day at the mines it was working, which include Owings, Columbia, Pinnickinnick, Carolina and Gypsy.

Ten thousand miners of eastern Ohio, Pennsylvania and the Panhandle section of West Virginia attended a large rally held at Bellaire Ball Park, at Bellaire, Ohio, Friday, June 26. The speakers were International Vice-President Philip Murray, Lee Hall, president, William Roy, vice-president, and G. W. Savage, secretary-treasurer of the Ohio miners. The meeting was held on the Ohio side of the river to escape injunctions, but was staged especially for the striking West Virginia miners.

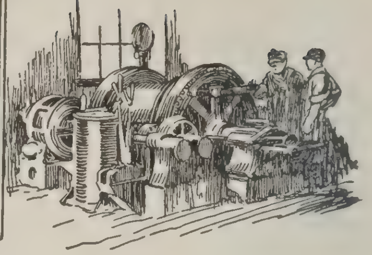
In federal court of northern West Virginia at Elkins, June 22, Federal Judge W. E. Baker withheld his decision on granting a temporary injunction to nineteen Panhandle coal companies against the United Mine Workers and continued in force for another 10-day period the temporary restraining order which he first issued June 2.

In a statement issued June 27 Van A. Bittner comments on the notice given by the Consolidation Coal Co. that it will evict union miners from its houses at Wyatt. Bittner says that the company threatens eviction suits unless the men return to work on the 1917 scale. "Coercion, intimidation and force are being used to compel the miners to sign petitions asking the company to reopen the mines," he adds, "notwithstanding the fact that the Consolidation Coal Co. has an agreement with the United Mine Workers."

Miners' mass meetings were held at Osage, Farmington, Rivesville and Kingmont on June 28, which were addressed by international representatives in the field.



# Practical Pointers For Electrical And Mechanical Men



## Small Welding Outfit for Bonding Also Makes Strong Air Line Joints

The use of electric welding equipment at some mines has only started but at others it is no longer limited to service inside the mine where tracks must be bonded. Modern repair shops find the electric welder particularly suitable for building up worn spots on machinery, making patches and securing bolts or nuts which might come loose in service.

Every once in a while one sees interesting examples which illustrate both the general utility of an electric welding outfit and the growing confidence placed in the kind of work it can do. Fig. 1 shows a picture of a T joint made out of sections of iron pipe. This T is in a 125-lb. compressed air line at the Bear Valley operation of the Williamstown colliery, owned by the Susquehanna Collieries Co., an anthracite producer.

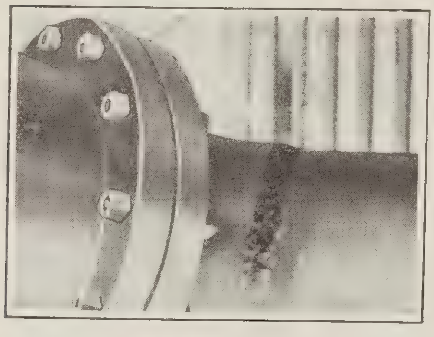


**Fig. 1—Home-Made T Connection**

This fitting was made by welding pieces of pipe with an electric track welding outfit.

**Fig. 2—No Reducer Necessary Here**

One piece of pipe was slipped into another and the joint made with an electric arc welding outfit.

This T stands between two large receiver tanks outside the compressor station. The main supply line thus is connected to both tanks which serve the air-driven equipment inside the mines.

Near the shaft where the air line passes into the mines it was necessary to use a smaller size pipe. Here again the electric welding outfit was used and a reducing flange was not necessary. The small pipe was entered into the large one and the joint securely welded as shown in Fig. 2.

When the line was put in service, tests were made on these joints by wiping them with oil. In this manner bubbles would indicate leaks. But there were no leaks and the joints have now been in service for several months.

Those who are not acquainted with the grade of work that can be done with a small welding outfit will no doubt be surprised to learn that both these jobs were accomplished with the usual type of welding outfit employed for applying rail bonds.

Fig. 3 shows this outfit in use at its regular job. Such a lightweight unit as this is easily transported. As men get a better knowledge of its general utility it comes into greater demand. E. J.

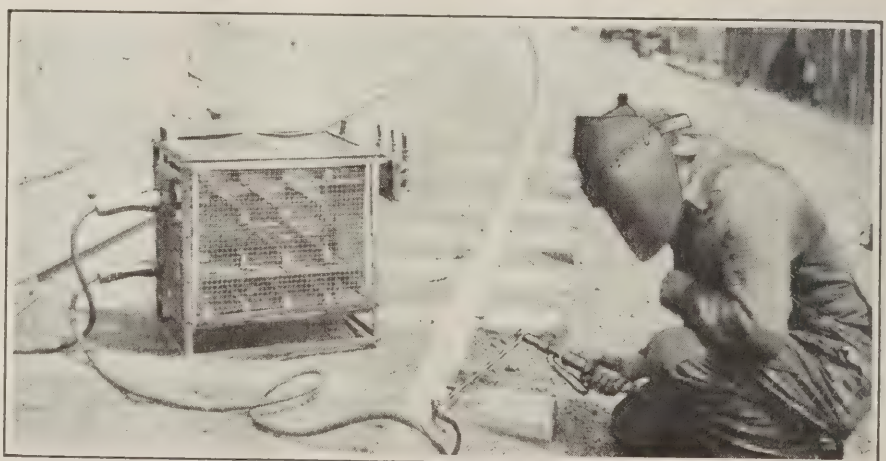

**Fig. 3—Electric Welding Machine Which Is Used to Make High Pressure Air Line Joints**

This isn't the only kind of work this outfit can perform. It is light and compact. The compressed air pipe joints used on a 125-lb. pressure line were made with this device. Sometimes it is used to apply bonds but frequently it is doing its bit repairing machine parts.

---

## Illuminate Dangerous Spots

The fact that there are still plenty of opportunities to install electric lights around mine tipples is made evident by the accompanying illustration. This picture was taken in bright sunny weather from a point near the bottom of a coal tipple.

In the darkest part of the picture is a set of crushing rolls driven by means of a chain and sprockets. Unless properly guarded, such devices are dangerous. When a man steps from the sunlight to a position under this tipple it is almost impossible for him to see anything until his eyes adjust themselves to the shade.

There is a feeling at most mines that all outside lights should be turned off whenever there is any daylight. Consequently, lighting circuits are often designed with this idea in mind and no thought given to the arrangement of lamps. Often lights in dark corners, which should always be lighted during working

A Dangerous Place Is Often Made Safe by Light

Lights which should be turned on during bright sunny days, should not be placed on the same circuit as lamps which are needed only at night. Here is a spot that is dark even when the sun shines. Its lamps should be separately controlled from the mine yard circuit.

periods, are on the same circuit as mine yard lights. As a result, when the yard lights are turned off from a point controlling the whole circuit, the lights in the dark spots are out of service too. One small accident often costs more than a large number of lights. It pays to lay out circuits so that lights in dangerous spots can be turned on whenever they are needed.

## Drum-Controller Trouble Can Do Big Damage

Several days ago one of our mechanics called me up and inquired if I would help him out of a little trouble that he was having with a slip-ring motor controller operating a small mine hoist. The controller was of the hand-operated, rheostat type, with external grids. The motor was a 50 hp. wound-rotor machine with a 550-volt stator winding. The controller handled two wires of the three-phase circuit and thus was reversible. The break was in air, the frame of the controller was cast iron and the cover was sheet steel. The finger board was on the left side facing the cover.

The mechanic had dismantled the controller and filed all the segments and contact fingers. While it was disassembled, I tested the motor and control wiring and also the drum segments for shorts, open and grounds. The lead-sheathed cable leading to the controller from an oil circuit breaker was also tested. Everything showed "clear" with a 50,000-ohm magneto.

The controller was then assembled and the hoist engineer put the controller handle on what was presumably the first point. There followed a flash and a loud report similar to that caused by a "dead short" on a circuit carrying a large amperage. After seeing the action of the controller in operation we tested again with similar results. All circuits tested "clear."

I then made a careful examination of the controller and found that there were no adjusting screws in a number of the contact fingers and that the star-wheel pawl spring had been disconnected. The star-wheel pawl spring was fastened and adjusted but there were no finger adjusting screws, so we robbed the grid contact fingers and put them on the primary fingers. Of course this is allowable only in an emergency. Then the primary contacts were carefully adjusted. The switch was closed and the controller drum was set on one point. The hoist engine started smoothly and the contacts did not flash at all.

This trouble, which was simple, could have become a serious one and hard to locate, as I know of a number of controllers that are operating without any adjusting screws on the contact fingers. The fact that this particular controller handled heavy currents and broke in air, coupled with the fact that an arc travels upward, caused an arcing, short circuit across the primary contacts which burned the lid and wooden finger board of the controller. Another reason for the arcing was that the engineer could not locate the first point of the drum with any certainty, probably because of the absence of the star wheel, and he unknowingly caused slight arcing that started the main trouble.

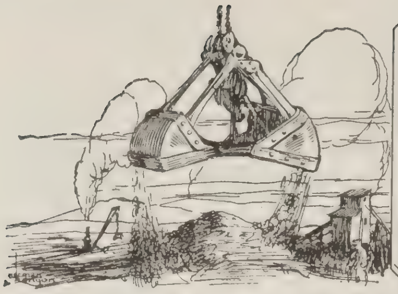
Careless maintenance of drum controllers and other switching devices has burned up more motors than any other one cause. The average electrician will solder all joints inside the motor and all lead wiring outside the motor and to the controller but will leave the controller with burned and pitted contacts and segments. This is almost equivalent to making an open circuit. Still he expects the controller to give perfect satisfaction. The controller operator often fails to oil the drum shaft until it is hard to turn and then, instead of oiling it, he will disconnect the star wheel spring, excusing himself by saying that it was so tight that he could not turn the controller handle.

GRADY H. EMERSON.

Acmar, Ala.

Electric Repair Shop Has Manufacturing Facilities

Efficient operation depends upon good machinery. This shop is equipped so that expert repairs can be done quickly. Thus the useful life of apparatus is greatly increased.



## Production And the Market

# Bituminous Coal Market Still Sluggish; Hard Coal in Summer Lull

Despite the belief of most authorities that consumption of bituminous coal has been well in excess of production since about the middle of February there is no sign of a dearth. On the contrary, soft coal continues to go begging just as it has been doing in recent months. Consumers seem to be indifferent to figures or arguments and continue to hold off purchases on the chance that prices will go still lower. The situation in the Midwest was further upset last week when over two hundred cars of smokeless arrived in Chicago on consignment. Prices have been slipping since and the bulk of it is still unsold.

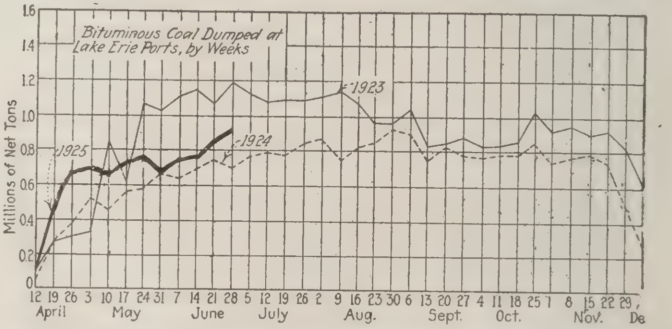
Western Kentucky suffers from overproduction and strip-mine competition, which have weakened prices. Favored with lake trade, some railroad contracts and scattered industrial demand, eastern Kentucky is busier and commands better prices. Business at the head of the lakes has run against a snag, consumers holding off for lower prices, which remain steady, however. Domestic business has fallen off in Utah, industrial demand being unchanged, though the outlook is somewhat brighter. The situation is somewhat better in Colorado, but in Kansas and the Southwest scarcely anything is moving.

### Cincinnati Trade Lacks Buoyancy

Buoyancy is lacking in the domestic market at Cincinnati, where chief interest centers in the lake movement. July circulars are being shaded, it is said, screenings being somewhat weaker. Southern Ohio holds its recent improvement in steam business, but eastern Ohio is very quiet. Pittsburgh fears the menace of Fairmont coal, which through recent declines can be brought in by rail at the price of the local product. Demand shows no pickup, however. Trade in New England and other Eastern markets is still flat.

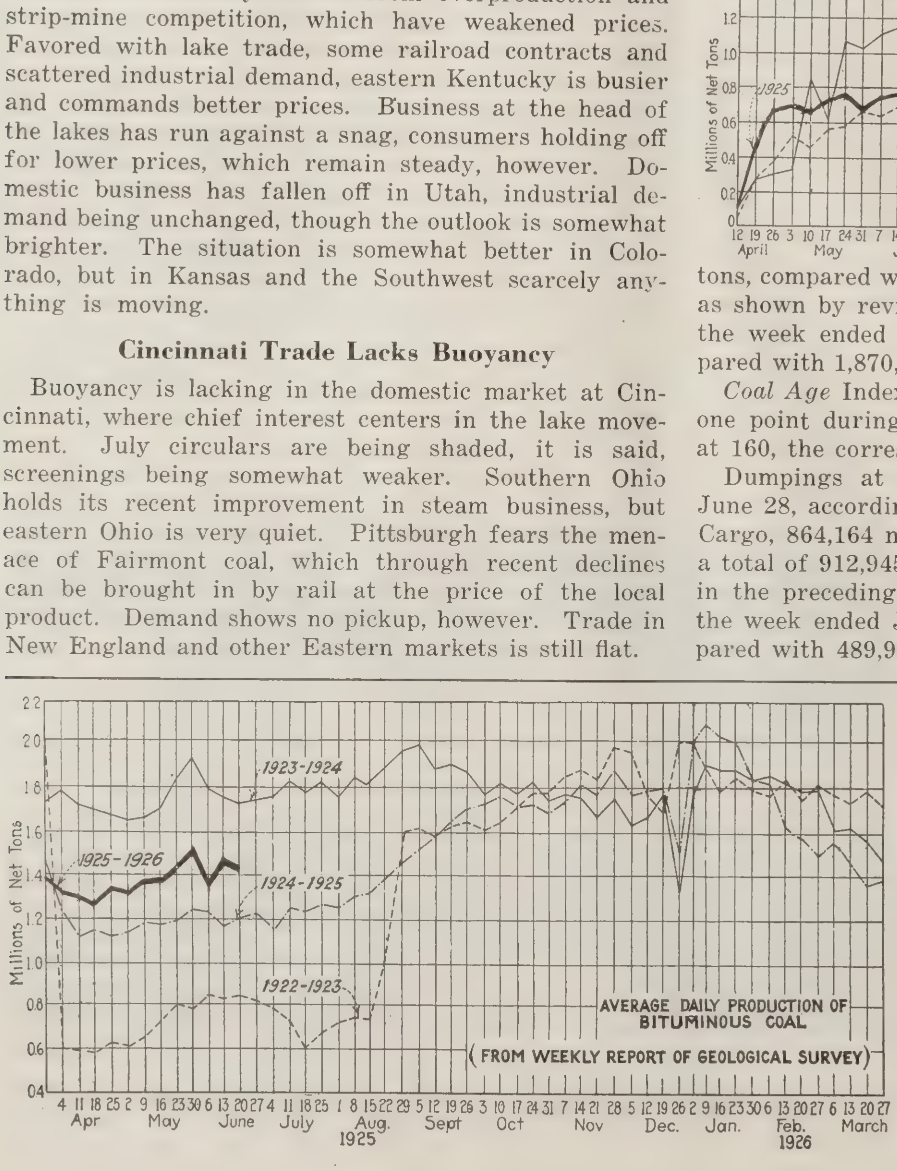
Trade in anthracite is marked by characteristic summer dullness, though it is probable that consumers will show more interest when news of the coming wage conferences spreads. Stove moves best, but independents are having trouble with chestnut. Egg is doing fairly well and pea is easy. Steam sizes, except barley, are hard to move. The companies are expected to add 10c. to the prices of the larger domestic sizes for July.

Bituminous coal output in the week ended June 20 is estimated by the Geological Survey at 8,434,000 net tons, compared with 8,621,000 tons in the previous week, as shown by revised figures. Anthracite production in the week ended June 20 was 1,788,000 net tons, compared with 1,870,000 tons in the preceding week.



*Coal Age* Index of spot prices of bituminous coal fell one point during the past week, standing on June 29 at 160, the corresponding price for which is $1.94.

Dumpings at Lake Erie ports in the week ended June 28, according to the Ore & Coal Exchange, were: Cargo, 864,164 net tons; steamship fuel, 48,781 tons—a total of 912,945 net tons, compared with 828,798 tons in the preceding week. Hampton Roads dumpings in the week ended June 25 totaled 447,290 net tons, compared with 489,944 tons in the previous week.



### Estimates of Production

(Net Tons)

| BITUMINOUS | 1924 | 1925 |
|---|---|---|
| June 6 | 7,615,000 | 8,375,000 |
| June 13 (*a*) | 7,385,000 | 8,621,000 |
| June 20 (*b*) | 7,434,000 | 8,434,000 |
| Daily average | 1,239,000 | 1,406,000 |
| Cal. yr. to date (*c*) | 222,164,000 | 223,148,000 |
| Daily av. to date | 1,533,000 | 1,537,000 |
| ANTHRACITE | | |
| June 6 | 1,846,000 | 1,674,000 |
| June 13 | 1,823,000 | 1,870,000 |
| June 20 | 1,823,000 | 1,788,000 |
| Cal. yr. to date (*c*) | 43,227,000 | 42,591,000 |
| COKE | | |
| June 13 (*a*) | 131,000 | 136,000 |
| June 20 (*b*) | 131,000 | 130,000 |
| Cal. yr. to date (*c*) | 5,879,000 | 5,103,000 |

(*a*) Revised since last report. (*b*) Subject to revision. (*c*) Minus two days' production to equalize number of days in the two years.

### Midwest Trade Weakens Further

The Chicago coal market, instead of showing signs of improvement as the month draws to a close, has shown very definite evidences of weakness. Screenings from southern Illinois, central Illinois, Indiana and western Kentucky have slipped off from 5c. to 10c. a ton and more. The reason is found in that the industries have curtailed buying rather than any increase in production. The contract situation is still stagnant, with no signs of activity anywhere.

Operators are still oppressed by the thought that present price levels cannot net them much business in competition with non-union coals from western Kentucky, and that if they are to live reductions in the wage scale will have to take place. Those operators who still have the financial ability are concentrating operating energies on coal loaders and other means of producing cheaper fuel.

The domestic market continues to be uniformly unsatisfactory. The retail trade in Illinois, Iowa and Wisconsin refuses to be interested in coal at any price, confident that they can put off their fuel purchases for another month or two without the slightest possibility of an increase in cost. Whether or not they are right remains to be seen. The domestic situation in Chicago was badly upset last week and prices on smokeless mine-run were shot to pieces, owing to the fact that smokeless operators on the Virginian Ry. consigned two or three hundred cars of coal to Chicago. This coal arrived early in the week and today the bulk of it is still unsold, with prices slipping rapidly. It is anticipated that these operators will book a pretty heavy loss before the coal is out of the way.

The situation in southern Illinois shows no change. A few mines throughout Williamson and Franklin County are working from one to three days a week. Most of them are crushing coal for their steam contracts and not much domestic sizes are moving. Railroad tonnage continues light from the shaft mines although the strip mines seem to ship railroad coal and the bulk of the steam coal and some of them also are crushing mine-run. It is understood that the Missouri Pacific R.R. is arranging to put in some storage coal from mines on its line. There has been no change in prices.

In the Duquoin field conditions are much the same as they have been. Two mines are working and getting two and three days a week. No railroad tonnage is moving. In the Mt. Olive district there is practically nothing doing and the little coal that is produced is crushed to take care of screening contracts. Railroad tonnage in this district is light. The Standard field continues to work—a few mines here and there—a couple of days a week. There is little railroad coal moving out and a fair demand for steam sizes. Domestic sizes seem almost impossible to move. Prices are unchanged.

**Coal Age Index of Spot Prices of Bituminous Coal F.O.B. Mines**

| | 1925 | | | 1924 |
|---|---|---|---|---|
| | June 29 | June 22 | June 15 | June 30 |
| Index | 160 | 161 | 160 | 166 |
| Weighted averaged price | $1.94 | $1.95 | $1.94 | $2.01 |

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States, weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and, second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke: 1913-1918," published by the Geological Survey and the War Industries Board.

Domestic movement of coal has not started in St. Louis. A little stuff is coming in, but it is not a factor in the local situation, with the exception of some apartment-house contract storage coal at below cost. Preparations are being made to put in school coal. Local wagonload steam is unusually quiet and carload steam is just active enough to keep the small amount of steam coal offered going. Country steam is quiet and country domestic active in spots. The Illinois business that is usually active about this time, seems to be going to east Kentucky coal entirely. In other parts of Illinois and Missouri the bulk of coal moving is from the western Kentucky field. No change in prices.

### West Kentucky Weak; Eastern Field Busy

Overproduction in western Kentucky and competition of strip-mine coal have caused further weakness. It is reported that $1.50 a ton represents the top of the market for best prepared coal and much is selling as low as $1.25, with some off-grade stuff reported as low as $1.10 a ton. Mine-run and screenings are reported at around $1@$1.25, with screenings stiffer as a result of lack of prepared orders.

Eastern Kentucky is in much better condition, with a range from $1 on screenings to $2.25 on 4-in. block, with just a little fine domestic block quoted at higher than $2.25, but without much movement. Eastern Kentucky is favored with lake business, some railroad contract business and scattered industrial movement, the mines being busier and getting a better price. Efforts to force June prices to $2.50 a ton on block were unsuccessful; the operator had to accept $2@$2.25 or leave his coal in the mine, as too many competitors were glad to accept the offered price.

Mine-run has been stronger than had been anticipated, gas and better grades bringing $1.35@$1.75. Egg and lump have been in very good demand at from $1.75 to as high as $2.10. Not much nut is produced, and this is selling at $1.50@$1.75, or at about the price of best mine-run.

### Northwest Trade Hits Snag

The coal trade is on the rocks again at the Head of the Lakes. Forty cargoes arrived at the local docks last week, of which five were hard coal, and fifteen are reported on the way from lower lake ports, but there is practically nothing going out from the docks at present. Buyers are holding back expecting a revision in prices and a general adoption of the 1917 wage scale before long.

On June 1 there was 2,848,892 tons of bituminous on the docks as against 3,118,722 at the same time last year. Of anthracite there was 436,354 tons as against 199,528 at this time last year.

Bituminous is not so plentiful as last year mainly because there was not a large stock on docks at the beginning of navigation, but hard coal is here because people will not buy, and what comes up remains here. The anthracite situation looks serious. There is no call for it at price levels now current. A big trade is expected in Pocahontas.

Prices of both hard and soft are steady, except that there is very little $7 Pocahontas left on the docks. Most of the docks are getting $7.50 for lump, stove, and egg at present.

At the Twin Cities soft coal is not moving to any extent. A quiet volume is moving for domestic and steam purposes, indicating no advance preparation of any tonnage. Steam buyers continue their waiting policy and seem likely to prolong it to the utmost. It is good as long as it lasts, and all the predictions of its downfall are but so many words—until something happens to either production or transportation.

The price schedule remains as it has been for some time, with little distress coal in the market most of the time and prices nominally as they have been; southern Illinois lump around $2.75; central illinois, $2.25; Indiana, $2.50; western Kentucky, $1.75; Hocking at the dock, $5.25, as before, and Youghiogheny, $5.75.

Summer dullness continues in the Milwaukee coal trade. Dock managers say that coal is going out very slowly just now, but they are looking for a rush of orders soon from dealers at interior points. During the past week cargo receipts totaled 95,600 tons—13,400 tons of anthracite and 82,200 tons of bituminous coal. This brings the total for the season thus far to 1,063,673 tons—305,855 tons of anthracite and 757,818 tons of bituminous coal.

### Prices Sag in West

Kansas shaft screenings, which for several weeks had been fairly firm at $2.75, have joined shovel screenings and crushed mine-run at $2.50. With the exception of some contract coal and a little for threshing, nothing is moving in the Southwest. There has been little storage, and no relief is expected from this source before late in July or in August. Operators and miners continue to dally with the subject of wage readjustments, but with little effect, except in Oklahoma, where all production is under the 1917 scale.

There has been little change in the situation in Colorado since last week. Some improvement is shown in consumption of slack by industries, but no betterment in the domestic trade for lump, nut and pea coal. Mines are operating about 2½ days per week, which accounts for the substantial decrease in output compared with a year ago.

Hot weather in Utah last week caused the domestic business to fall off considerably. Industrial demand for coal is about the same as it has been for the past two or three weeks, though the announcement that the Southern Pacific R.R. desired bids for 600,000 tons of mine-run annually is encouraging. It is thought that a bid of $2.50 per ton will be made. There is very little contracting at present outside of small ones, and storage orders are hanging fire. Prices remain as firm as ever and the labor situation is excellent.

### Buoyancy Missing at Cincinnati

Through its very lack of buoyancy and activity the domestic market is the most interesting of the Cincinnati list now. July prices on smokeless are going out on lump at $3, but it is an open secret that the spot market is more around $2.75 and good stuff can be had for that price, though this is the quotation on egg. High-volatile lump, after showing a disposition to seek an upward level, has fallen into lassitude. For a time in June it looked as if the market was \$2.25@\$2.50, but a fair quantity can be had now around \$2@\$2.25. Kentuckians are asking \$2.40 for July deliveries, but even their market on block sizes seems to be closer to \$2.25 than the new figures.

Most interest now attaches to the lake movement and with the steady grind on 2-in. and mine-run, some bolstering is necessary in filling out cargoes and for straight shipments by the lake people, who buy in the open market rather than on contract. Two-inch has a steady pull at \$1.65@\$1.75 with egg about 10c. higher. Steam mine-run while lagging a little still has a range of \$1.25@\$1.40 with the gas and byproduct bringing from 10c. to 20c. higher. Screenings have dropped a little. Too much "cats and dogs" on the market has caused a sagging lately but on other occasions there has been a rebound this season, so while lower grades can be picked up around \$1, generally speaking the spot market still remains \$1.10@\$1.15.

Retail business in Cincinnati is going into the new month without any advance in price. Smokeless lump is \$7.50; mine-run, \$5.75@\$6; bituminous lump, \$5.75@\$6.50; slack, \$4@\$4.25.

River business continues in fair shape with the stage running at a good depth. Most of the coal coming in is either for home or nearby delivery or for transshipment by rail. Stocking here has about reached its limit, unless there should be a tumble in prices in the next month that would make this course advantageous.

The slight improvement noticeable lately in steam circles in the Columbus trade still continues. Buying is more widespread although the greater bulk is spot business. Contracting is still in abeyance, as purchasing agents can fill their requirements on the open market for less money. There is still some distress coal on the market, but the tonnage has been reduced because shippers and producers are not sending out cargoes on consignment to such an extent as formerly. As reserves are being gradually reduced the tone is slightly improved and both producers and shippers believe that better things will develop soon.

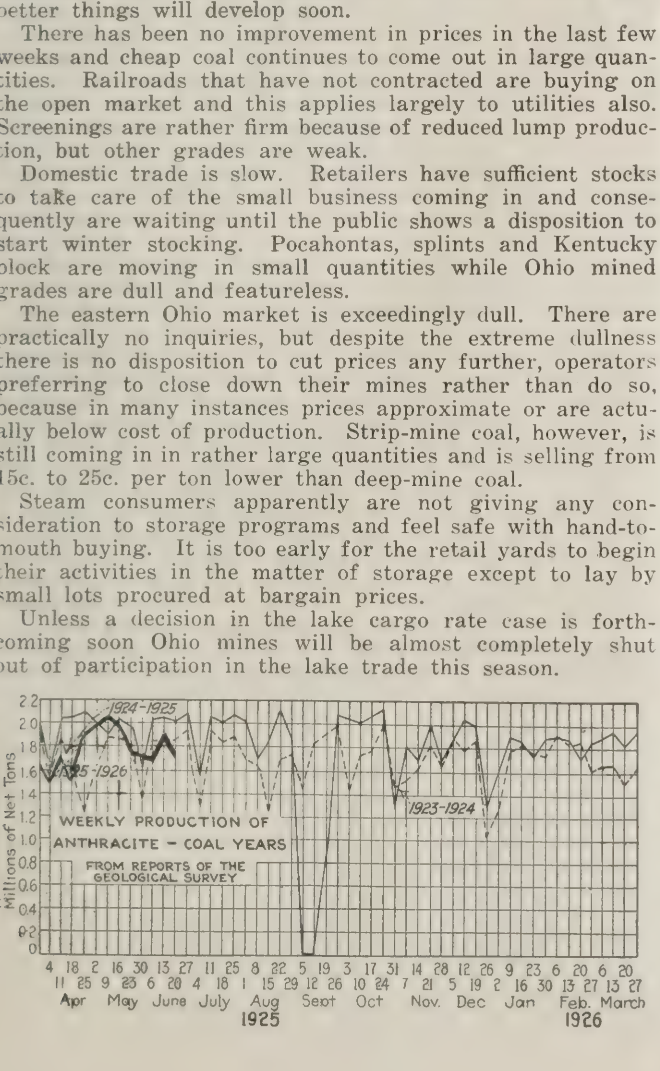
There has been no improvement in prices in the last few weeks and cheap coal continues to come out in large quantities. Railroads that have not contracted are buying on the open market and this applies largely to utilities also. Screenings are rather firm because of reduced lump production, but other grades are weak.

Domestic trade is slow. Retailers have sufficient stocks to take care of the small business coming in and consequently are waiting until the public shows a disposition to start winter stocking. Pocahontas, splints and Kentucky block are moving in small quantities while Ohio mined grades are dull and featureless.

The eastern Ohio market is exceedingly dull. There are practically no inquiries, but despite the extreme dullness there is no disposition to cut prices any further, operators preferring to close down their mines rather than do so, because in many instances prices approximate or are actually below cost of production. Strip-mine coal, however, is still coming in in rather large quantities and is selling from 15c. to 25c. per ton lower than deep-mine coal.

Steam consumers apparently are not giving any consideration to storage programs and feel safe with hand-to-mouth buying. It is too early for the retail yards to begin their activities in the matter of storage except to lay by small lots procured at bargain prices.

Unless a decision in the lake cargo rate case is forthcoming soon Ohio mines will be almost completely shut out of participation in the lake trade this season.



Output of eastern Ohio mines during week ended June 20 registered a decrease of 9,000 tons from the preceding week.

### Pittsburgh Sees New Menace

A new epoch in the Pittsburgh coal situation has been brought about by recent declines in Fairmont coal, a well-posted authority having figured that with rail shipment Fairmont coal can be brought to the city at the same delivered price as Pittsburgh coal.

Pittsburgh district production is only about 20 per cent of capacity. A good deal of it is coming in by river, and considerable is moved by truck.

A report was current last week, but cannot be verified, that a number of operators have had such success with plans that they count on opening quite a number of mines soon on an open-shop basis, with the scale of November, 1917. Market prices and demand show no change.

The Buffalo market continues quiet. Quotations are \$1.60@\$1.75 for Fairmont lump, \$1.40@\$1.50 for mine-run and \$1.25@\$1.40 for slack; \$2.25@\$2.50 for Youghiogheny gas lump, \$2@\$2.25 for Pittsburgh and No. 8 steam lump, \$1.30@\$1.50 for slack; \$1.75@\$2 for Allegheny Valley mine-run; Cambria County smokeless at curb, retail, \$6.

Uncertainty as to whether or not the agreement between the hard-coal operators and the miners will be renewed in September, and the possibility of a strike, is responsible for brisk buying on the part of Toronto householders. During the past two weeks a marked improvement has taken place in the hard-coal market, and this activity is expected to continue for some time. Supplies are coming in regularly, and no scarcity is anticipated in the near future. Prices are unchanged as follows: Anthracite, \$15; Welsh anthracite, \$16; coke, \$12; Pennsylvania smokeless, \$5.85; steam lump, \$6,40; slack, \$5.60.

### New England Market Weakens Further

If anything, the steam coal market in New England is more depressed than a week ago. Shippers are saying something about a better demand on the line and in the West with prices on prepared that compare with \$4.40 per gross ton, f.o.b. vessel at Hampton Roads for mine-run, but it is noticed that the same interests are keen to make spot sales of No. 1 Navy Standard Pocahontas and New River mine-run at \$4.25.

It is evident there is a good deal of whistling to keep up appearances, but the fact is that practically every agency takes its turn during each fortnight in having surplus coal at the piers that it is under pressure to move. So long as this condition prevails there will be few indications of firmness and fewer sales at the \$4.40 extreme price that any first grade coal can now command.

On cars Boston receipts continue light, a circumstance that favors rehandling factors with facilities of their own. Several sales of 500-ton and 1,000-ton lots in the past few days have been at \$5.35, and it is generally understood that one large buyer was obliged to pay this figure for delivery spread over three months, high-grade low-volatile mine-run being the coal that was sought for power-house use.

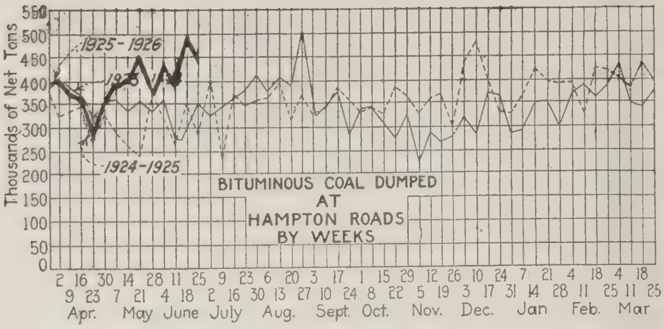
At Providence, R. I., about the same basis prevails, although a few factors are getting \$5.40@\$5.50 there for special coal that is guaranteed to be mine-run. So much nut-and-slack has been worked off this season that buyers are becoming insistent that they be supplied with what they have been accustomed to buy.

Owing to public statements made by state fuel officers since June 15 there has been better request at retail for anthracite, and this has had a favorable effect also upon consumers who the past year or so have used bituminous for ordinary household uses.

All-rail from central Pennsylvania the steam-coal traffic is in no wise improved. Shutdowns are spotted over a wide area, and no one is in position to say when or what the end will be.

### New York Trade Dull but Optimistic

The New York market for soft coal remains dull, buying is slow and where ten cars formerly was the minimum order, one car is now taken, with frequent requests that it be rushed. Consumers evidently are getting to the point where they will soon be forced to buy heavier, as inquiries are more numerous.



There is not much encouragement among the shippers although some optimism is found occasionally. Better buying is looked for by the end of July or early August.

The few bids received by the U. S. Shipping Board for bunker supplies do not indicate that the market is overcrowded, as the prices submitted are in keeping with open-market conditions.

Official records indicate that soft coal is on the upgrade, but it is difficult to discern this by observing the Philadelphia trade. The increase, however, is not such as to create any air of activity. Production of non-union coal has increased until it is doubtful if any considerable quantity of union coal is coming here.

Intimations are that once the anthracite proposition is settled trouble can be looked for from the union in the soft-coal region.

There was something of a stir in slack last week. Buying seemed to stop almost simultaneously from a number of large concerns usually interested. For a while shippers expected to have coal on their hands, but it was almost as quickly absorbed by other interests, without the least semblance of a break in prices, and now all buyers seem to be back in the market for as much as ever.

The Baltimore coal trade is beginning to wonder when the promised prosperity is to begin. Consumption is not up to the mark, and coal buying of every kind is on a hand-to-mouth basis. In the past month there has been no improvement in the situation either as to demand or prices. First-class coals are still obtainable in almost any quantity at prices so close to actual production cost that there is little in the business for anyone. The export situation fails to show the activity that marked the month of June in some other years, although there were two shipments last week.

The market at Birmingham is very quiet. Inquiry is light and bookings are pretty well restricted in the spot trade to a few cars for prompt shipment. There are few new contracts being made, most all agreements negotiated being renewals. Industrial demand is on about the same scale it has been for several weeks, with the exception that power companies are consuming an increasing amount as the dry weather continues to make the hydro-electric plants less efficient to meet power requirements. The Western Alabama Railroad bought about 48,000 tons of Mary Lee washed nut coal to be delivered through the next twelve months. Bunker trade is reported quiet and featureless.

Domestic conditions show very little improvement. High-grade coals are moving fairly satisfactorily on contracts, but there is some surplus available for the open market, which is being disposed of, but not without some effort.

Quotable prices on steam grades have not changed in the past week, and all domestic grades have maintained stable schedules with the exception of the cheaper qualities of lump and other sizes, which always sell off during dull periods. Big Seam lump can be bought for $1.80@$2.25 mines at present. The schedules on domestic coal will advance July 1, Carbon Hill lump going to $2.95; Cahaba, $3.85@$4.60; Black Creek, $4.10; Corona, $3.20; Montevallo seam, $4.35@$5.10 per net ton mines.

Production is running around 340,000 tons per week, mines operating on a basis to meet anticipated trade requirements to a more marked extent than before during periods of depression.

### Hard-Coal Business Disappoints

While the anthracite trade at New York is not totally flat there is no great activity. Coal is moving in fair shape but there is not the "pep" to the buying that dealers expected in view of the wage negotiations about to begin. It is expected, however, that the publicity attending the wage conferences will have a wholesome effect on consumers.

There is no delay in moving company coals but independent producers find it difficult at times to keep all sizes going. The greatest difficulty is with chestnut, which continues to pile up and at times causes distress. Retail dealers will not pay more than company prices unless in need of the size wanted.

It is expected that the line companies will add the usual 10c. per ton to their June prices for July, but no official announcement has been made.

Demand for coal at Philadelphia has declined further and the consumer seems to have eliminated himself entirely as a factor.

The operators have had difficulty in moving their production, even though it has been lessened by shortened working time. Some of the independents have tried to move blocks of prepared coal at a price concession, but have met with very little success, principally because most dealers are filled up.

Due to the change in sizes some dealers are figuring that the demand for pea is going to be very light and are utilizing some of the storage space usually taken by the small size, to accumulate a nut stock.

Steam sizes are still difficult to care for and considerable independent coal is selling off price. The call for barley is good, but it does not take up the production, and the other sizes are even slower than that. Large users have not begun to store up in case there is a suspension.

It is taken for granted that the companies will add the usual 10c. for July except on pea and smaller.

Baltimore hard-coal dealers find business slow—delayed because customers either have not the money to lay out for coal on storage or are unwilling to lay out money for such fuel. Retailers are still uncertain what July wholesale prices are to be, although it is likely that operators will increase prices 10c. per ton. It seems not at all unlikely that July retail prices will remain the same as they were for June.

The Buffalo anthracite trade is about as close to a standstill as it ever is. Dealers say that they have never sold so little during the open season as they are selling now and they look for a slow movement all summer. The lake trade is still moderate in volume. Shipments for the week were only 44,900 tons, of which 34,400 tons cleared for Duluth and Superior and 10,500 tons for Chicago. Lake freight rates continue at 55 to 60c. to Chicago and 40c. to Duluth and Superior.

Some of the docks here are running pretty slow as coal does not move readily from the upper lake docks.

### Inquiries Light for Connellsville Coke

The merchant furnace at Standish, N. Y., making low-phosphorus pig iron, has contracted for Connellsville coke for third quarter. All that is stated positively about the price is that it lay between $3 and $3.25. As particularly good coke is required there is no indication that standard furnace coke could not be bought at $3 for the quarter, this having been the price in several contracts. In fact, it is intimated that for July, and perhaps for July and August, $3 could be shaded a trifle. There is no test, however, as there is no inquiry in the market. Some recent inquiries have been withdrawn, as the inquirers have concluded not to run their furnaces.

The spot furnace coke market remains at $2.75@$2.85, being very narrow in point of turnover.

Standard foundry coke remains at $3.75@$4.25, with sales light, chiefly at close to the lower figure. Some 48-hour coke has been going for foundry use for weeks past at $3.50 or thereabouts.

---

## Car Loadings, Surplusages and Shortages

| | Cars Loaded | |

# Foreign Market And Export News

## British Coal Market Marks Time Pending Wage Settlement

Business in the Welsh coal market has perked up a little since the Whitsun holidays, but is still very bad. There are now 5,000 fewer miners at work in Wales than three weeks ago and production is still in excess of demand. Coal salesmen are all out to prevent further pit stoppages but cannot get their wagons cleared. Anxiety regarding a national strike has somewhat abated, so that buyers are waiting for prices to drop further before placing orders; they also hope to take advantage of any revision in the wage agreement.

In the face of German competition there is no chance of prices rising any further and salesmen are making concessions to immediate buyers so as to clear their wagons, though no reductions are obtainable on later deliveries. Prices have dropped 3d. to 6d. and buyers are able to get a further 3d. to 6d. concession for immediate delivery.

Notices have been given at another pit to 350 men, though one of the Merthyr collieries is to be reopened, giving employment to 900 of the former 2,500 employees.

The Newcastle market is slightly better as far as inquiry is concerned, though there is no improvement in contracts actually placed. There is little inquiry for forward business, as buyers seem to be awaiting the outcome of the present wage trouble. Notices have been given to the men at four important collieries, at another, work is continued from day to day only, and at another the men have divided the work by working alternate weeks.

There are one or two contracts out for gas coals up to 8,000 tons at 19s. 4½d. per ton c.i.f., but otherwise there is no business.

Output by British collieries in the week ended June 13, a cable to *Coal Age* states, totaled 4,980,000 tons, compared with 3,000,000 tons in the previous week.

### French Coal Market Almost At Standstill

In the French coal market both industrial and home fuels have hardly any demand and stocks are accumulating at the mines. And clearances will not be quickened by the fact that traffic on the waterways is virtually at a standstill.

The question of salary is still pending. After having conferred several times with the public authorities, the North and Pas-de-Calais mine owners have decided to grant their men up to June 30, an increased rate of 20 per cent on the prime of high cost living (instead of 40 per cent up to May 15) conditionally on the immediate institution of a reduced freight tariff on the Nord, State and Orleans Railways, for the transport of coals to the west of France, and on the re-establishment of import licenses for German coals, in order to avert being swamped by German fuels.

From May 1 to 23, the Office des Houillères Sinistrées received from the Ruhr 407,800 tons of indemnity fuels, including 178,000 tons of coal, 207,700 tons of coke, 22,100 tons of lignite briquets, a daily average of 17,700 tons.

In the first ten days of June, the O.R.C.A. received from the Ruhr 87,353 tons of indemnity coke. The price is unchanged.

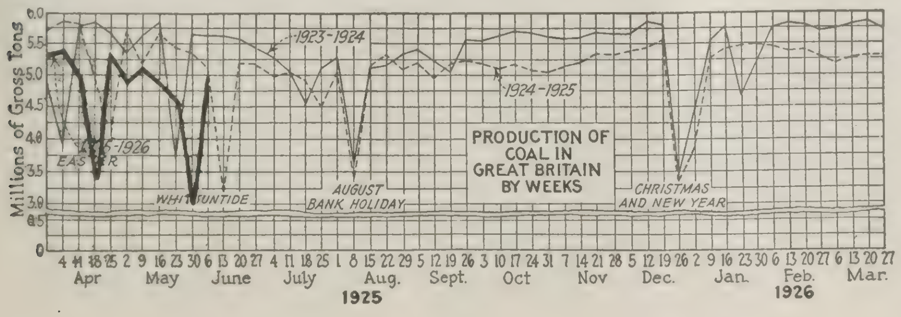
### Seasonal Dullness Prevails At Hampton Roads

The market at Hampton Roads was weak last week, with Canadian shipments falling down somewhat and other foreign business negligible. Bunker trade was temporarily slack, the bulk of shipping failing to call for coal.

Inquiries were rather dull and a seasonal slackness appeared to have settled on the trade. A fair supply of coal was on hand at the piers, and some cargoes were being offered below the market in distress.

### Belgian Demand Better

The general situation in the Belgian coal market shows no change, but there is some difficulty with regard to clearances. Demand, however, is slightly better, and as production in the Center and Charleroi Basin is much reduced stocks are being drawn upon. In the Liége region stocks remain very high. With the rise of sterling competition from the British side is less pressing.



### Export Clearances, Week Ended June 27, 1925

# News Items From Field and Trade

## ALABAMA

The Tennessee Coal, Iron & Railroad Co. has under consideration extensive improvements and betterments at its No. 8 colliery, near Fairfield, which will include the installation of a long conveyor belt for carrying the washed coal from the mine to the byproduct coke plant, and other modernization work, the details of which have not been announced.

The Deepwater Coal & Iron Co., with headquarters in Jasper, will begin the extensive development of its coal and ore properties in Jefferson, Walker and other counties in the mineral district at an early date, according to a recent statement by L. B. Musgrove, executive head of the corporation, which was organized several years ago with a capitalization of $15,000,000.

## ARKANSAS

The W. J. Francis Coal Co., Bates, has put on a night crew to fill its contract for coal with the Kansas City Southern R.R. The mine was closed for five years until recently.

More than 1,000 union coal miners marched June 26 from Ozark to Russellville, as a peaceable demonstration against any mine operations in the Arkansas fields except under the terms of the 1924 wage agreement. Four Arkansas mines in the Spadra field now are operating on an "open shop" basis. A similar demonstration last week was followed by one mine resigning the 1924 contract after announcing it would operate under the 1917 wage scale.

## COLORADO

The Moffat Coal Co., which has long been operating extensive bituminous coal mines near Oak Creek, is making preparations to start work in earnest upon the development of its anthracite property, known as the Crawford tract, in the Elkhead district, 22 miles northwest of Steamboat Springs, where preliminary work has been in progress for the past two years. The Moffat company will this summer establish an extensive camp and push development work, to have a mine open and ready to ship coal by the time the Moffat tunnel is completed next year.

## ILLINOIS

The Springfield District Coal Mining Co. has decreased its stock from $1,000,000 to $50,000.

Replacement of the tipple and surface plant will be completed about July 15 at Industrial Mine No. 18, Sesser. The plant, including all buildings, was totally destroyed by the tornado that passed over southern Illinois March 18.

The Spring Valley Coal Co., Spring Valley, has decreased its capital stock from $2,500,000 to $500,000.

The Majestic Mine, owned by the Equitable Coal & Coke Co., Duquoin, has closed down for repairs, including the retimbering of the main shaft.

The Buckley Coal Co. has closed a transaction with John Bontsche, Peoria, by which it will assume control of Mine A of the Citizens Coal Co., at Springfield, for a period of ten years. The mine, located just west of Springfield, has been closed down for some time, but will be reopened in a short time. The Buckley Coal Co., composed of George W. Schwaner, Edward H. Buckley and Carl H. Elshoff, also operates the Cantrall mine. The A mine of the Citizens' Coal Co., which has been taken over by the Buckley company, is generally considered one of the best equipped in the Springfield territory. It has an output of 2,000 tons daily. The company has entered into contracts and hopes to have the mine in operation practically all of the time.

Arthur Williams, Oswald Thomas and Robert Bartham have purchased a coal mine near St. Augustine, seven miles from Abingdon, which they will operate.

It is stated that the Bush Company contemplates the sinking of a new coal shaft on its land about six miles east of Zeigler.

The Assumption Coal & Mining Co., Assumption, has cleaned its mine and will begin to hoist coal within a few days. The company operates two mines at Pana, and one at Moweaqua, both of which are near Assumption.

## INDIANA

The Joan Coal Co. property, at Riley, has been deeded to M. E. Lowish, of Indianapolis, by J. W. Marby, president of the company. The coal property was deeded in an exchange of real estate.

The Keeley Coal Co. of Dugger, Ind., has filed a certificate of final dissolution with the Secretary of State.

J. B. Orr, coal operator, and Oren M. Ragsdale were appointed receivers for the Vandalia Coal Co. by Judge Mahlon E. Bash, June 19 in probate court. Bond was fixed at $25,000. The assets of the coal company comprise chiefly a number of coal mines near Sullivan valued at $5,000,000. The suit for receivership was brought by Alfred M. Ogle and Harold T. Dyer, stockholders in the company, who said that although the company was solvent, it was unable to operate and meet its obligations in the ordinary course of business.

The Big Four Coal Co., New Albany, has filed a preliminary certificate of dissolution.

A deal representing an investment of more than half a million dollars has just been completed by the United Electric Coal Co. It is said that the deal involves 2,500 acres of mineral land lying east of Farmersburg, in Jackson township, and 1,400 acres in the southern part of Vigo County. The purchasers contemplate the establishment of a large strip-mining enterprise. Nearly 1,200 acres of the coal land has been purchased in fee simple and on 1,300 acres the coal has been purchased outright, with option to buy the surface. One-half of the $500,000 represented in the deal will be expended for the coal, while the balance will be spent in equipping the large strip-mining plant on the new holdings.

## IOWA

The Riverville coal mine, near Albia, has been closed indefinitely, probably for the summer. Another mine, the Hocking, was closed April 1. The two mines employed 600 men. The Gold Goose mine has reduced output to one-fourth because of floods from recent rains.

James Mitchell, Knoxville, has been named a member of the board of examiners of mine inspectors of Iowa, succeeding the late John Caldwell.

## KANSAS

One hundred and two men on seventeen teams representing the largest mines in Kansas participated in the seventh annual state first-aid and mine-rescue meet, at Pittsburg, June 13. A team from No. 20 mine of the Western Coal & Mining Co., at Arma, with Captain Louis Trego at the helm, won first place with a perfect score of 100 per cent. Two teams tied for second honors, and the flip of a coin gave second place to the Jackson-Walker Coal & Mining Co.'s team, and third to the Dittman-Wachter Coal Co.'s entry. Both scored 99½ per cent. All but two of the teams scored more than 90 per cent, the lowest average being 84¾ by a team with only four weeks' training. The two teams placing highest will represent Kansas in the international mine safety meet at Springfield, Ill., in September.

## KENTUCKY

Announcement was made at Frankfort on June 18 that the Workmen's Compensation Board had increased the basic compensation insurance rates for underground coal mining to $4.57 instead of $3.75 and minimum $3.72 instead of $2.85.

The Thrifty Household Coal Buyers Association, Lexington, capital $10,000, has been chartered by W. McC. Johnston, D. C. Johnston and J. T. Johnston.

A. H. Stepp, formerly manager of the Louisville office of the Southern Coal Co., who was succeeded a few weeks ago by Emore Manning, has returned to his old home at Birmingham, Ala., where he plans to re-enter the coal business.

Under foreclosure action J. B. Torbett, former owner of the Phœnix Coal Mining Co., Drakesboro, recently took back the mining plant, the buyers failing to meet their notes. The property has since been sold to the Potter interests of Nashville, controllers of the Nashville Coal Co., who on June 10 started the plant operating on a nonunion basis. This plant was the only one that tried to operate on a union basis last year following the strike in western Kentucky. A few months of steady losses resulted in its being closed down. There isn't a union operated plant in the western Kentucky field today.

The Universal Coal Co., Owensboro, acquired the holdings of Jennings Coal Co., including about 200 acres of land, at Basket, the early part of June.

State Senator James R. Rash, of Madisonville, who is connected with the St. Bernard division of the West Kentucky Coal Co., has announced that he seeks re-election. While opposing coal tonnage taxation, Mr. Rash favors legalized betting on races and voted that way in the last Legislature. Unfortunately coal tonnage taxation and the question of legalized betting are being linked as the two big issues before the legislature.

The Consolidation Coal Co. recently filed suit against the Kentucky State Tax Commission, seeking an order to prevent the commission from increasing tax assessments for Letcher County beyond totals certified to by the County Board of Supervisors.

James R. Rash, prominent coal operator of Madisonville, former head of the St. Bernard Mining Co., now with the West Kentucky Coal Co., which absorbed the St. Bernard, has announced his candidacy on the Democratic ticket for re-election as state Senator from the Sixth District, composed of Hopkins and Christian counties.

One of the old Jewett, Bigelow & Brooks mines—the J-B Jellico Coal Co.—has been rehabilitated at Shafer, Ky., and is shipping coal again under the firm style of the Commodore Jellico Coal Co. J. T. Bradley, of Pineville, is in active charge and directing operations. New acreage adjoining has been acquired and the property will be put into first-class shape by Knoxville and Cincinnati bankers and coal men, who purchased it. New picking tables have been installed and other new equipment is to be added.

## MONTANA

Albert Gatley, superintendent of the Republic Coal Co., of Roundup, has been appointed by the state Industrial Accident Commission a member of the state board of coal mine inspectors. Mr. Gatley, whose term is for one year, was named in place of Thomas Good, who was unable to qualify because of illness.

## MINNESOTA

The State of Minnesota has just reorganized its bureaus and departments by which the purchasing will be handled through a single department. This will include coal for all state institutions.

**Plant No. 4 of the Coal Mining Co. of Liévin, France**

This illustration was made from a photograph taken as the plant neared completion. As the mines are essentially hand operated below ground, the power houses are not imposingly big structures even at large establishments.

## MISSOURI

William Mitchell, a coal operator of Huntsville, was elected president of the Missouri Mine Safety Association following a state first-aid meeting held at Moberly recently. Frank W. Fenix, of Joplin, state mine inspector, was named as vice-president, and George Happle, of Moberly, secretary. The first-aid team from Huntsville won first prize, and will represent Missouri in the national meet to be held in Springfield, Ill., Sept. 10, 11 and 12.

At a meeting in Kansas City, June 3, to discuss methods for saving fuel, officials of the Kansas City Southern Ry. revealed that the road spends $2,000,000 a year for fuel. This, it was said, constitutes 35 per cent of the total operating cost of the system.

## NEW YORK

Koppers Seaboard Coke Co., Inc., New York City, has filed a certificate in the office of the Secretary of State at Albany increasing its capital from $300,000 to $600,000.

## OHIO

The Cleveland office of the Philadelphia & Cleveland Coal Co., which was the main office of the concern, has been consolidated with the Columbus office, located on North Front St., as of July 1. A. C. Ingersoll, president of the company, has purchased a home in Columbus and will remove there. The company is a large distributing concern with offices at Cincinnati, Indianapolis, Huntington, W. Va., and Pittsburgh. The concern operates a large storage plant at Groveport, on the Hocking Valley, where about 100,000 tons of slack is in storage.

Petitioners in the involuntary bankruptcy proceedings against the Blanchard Zanesville Mining Co., which operates large mines north of Zanesville, have united in a request to the federal court that the receivership be lifted. C. M. Maxwell, who has been acting as receiver, has joined in the request. It is averred that the company is solvent and that it should be made free to carry out large fuel contracts with the Ohio Power Co., which operates a large plant at Philo, south of Zanesville.

Leonard Johnson, sales manager of the Lorain Coal & Dock Co., of Columbus, resigned that position June 1 to become associated with the C. W. Claslin Coal Co., of Boston, Mass. The Claslin company does a general wholesale coal business.

Since two addresses were made recently in Ohio by John L. Lewis, president of the United Mine Workers, coal operators in the southern Ohio field report a much more radical feeling among the miners of the state. For this reason the likelihood for a compromise on the Jacksonville scale, which might make it possible for operators in the southern Ohio field to open mines, is not as great now as formerly.

The Hocking Valley R.R. Co. has placed orders for coal for its 1925 requirements. Only Ohio mined coal is to be used. Several bidders asked for the award but the contract was let to smaller Ohio operations at $1.65 per ton, f.o.b. mines.

Noel L. Mahan, Western agent for the General Coal Co., is moving general Western headquarters of the company to Cincinnati. The Detroit office will still be maintained. Elmer Weirhake, who has been resident manager in Cincinnati, will become assistant general Western sales agent.

The Ohio & West Virginia Coal Co., a large jobbing house, with offices formerly located at 16 E. Broad St., (Columbus,) may be liquidated, according to a report. The company has not been active in business for over a year, when the offices were closed, and the way things stand now liquidation seems mighty favorable. David Armstrong, of Jackson, is head of the company.

Stanley Johnson, for the past six years assistant general manager of the Lorain Coal & Dock Co., has been named second vice-president to succeed his cousin, Leonard Johnson. Leonard has been serving in this capacity for five years, but recently severed his connections to take a position with the C. W. Claflin Co., a wholesale coal concern of Boston.

## OKLAHOMA

If something is not done about the non-union operation of the Crowe Coal Co. in the Henryetta field, union miners working under the 1924 scale for the same company in Kansas will be asked to call a strike, William Dalrymple, president of the district 21, United Mine Workers, says. It is rumored that a petition is being circulated asking Gov. M. E. Trapp to recall the troops, which, according to Chief of Police Stormont, still are on duty, although there is no indication of any trouble at the mines.

## PENNSYLVANIA

The Glen Alden Coal Co. is planning the establishment of a large coal-storage plant, the largest in northeastern Pennsylvania, near the Wyoming monument, Wyoming, it is reliably reported in Scranton. The company is said to be negotiating for the purchase of a farm located between Wyoming and Dickville for this purpose. The farm contains 50 acres and it is understood will change hands for the sum of $30,000. The Delaware, Lackawanna & Western R.R., the Glen Alden coal carrier, runs through the farm. According to reports the plant will have a capacity of 100,000 tons of coal and will consist of two sections.

The Coy mine of the Brush Creek Coal Mining Co., which has been leased by the Rochester & Pittsburgh Coal & Iron interests of the Jefferson & Indiana Coal Co., began operations on June 22 with more applicants for work than could be used.

The Connellsville Central Coke Co. is resuming operations at the Herbert plant after being idle for several months. There are 210 rectangular ovens at this plant.

The Temple Iron Co. will hold a meeting at Reading on Thursday, Sept. 3, to wind up its affairs. At one time it was commonly known as the "Hard Coal Trust," as its stockholders were the hard coal carrying railroads. The company has been inactive since 1914, when the U. S. Supreme Court declared it a monopoly.

Federal Judge Robert M. Gibson on June 23 denied the application of the United Mine Workers for an injunction to restrain the Jefferson & Indiana Coal Co. and Sheriff John M. Malcolm, of Indiana County, from interferring with union meetings near the company's mine in Indiana County.

William Geary has resigned as superintendent of the Sunshine plant of the Baton Coal & Coke Co., at Martin. Mr. McDowell, superintendent of the Linn plant, near Braznell, has been placed in charge of both plants.

The Pennsylvania Coal & Coke Co. reports May gross at $349,382, compared with $430,046 in the same month last year and deficit after all charges, except federal taxes, of $61,419 against a deficit of $49,540. For the five months of the year gross totaled $2,269,244, against $2,629,398 a year ago and deficit after charges $282,752, compared with $86,513.

The Ridgeview Coal Co., of which Jesse K. Johnston is president, has let contracts with the Link Belt Co. for one slack conveyor, one sand and slate conveyor for conveying coal from the mine to the tipple and for two mechanical loading machines, with a capacity of 500 tons daily. Charles E. Craig of Morgantown, W. Va., has accepted the position of supperintendent of the Ridgeview company and is now in complete charge of operations.

Officials of the Kingston Coal Co. have decided to sell a number of their houses to employees of the concern. The company owns more than 100 houses in Kingston and Edwardsville boroughs and some of their employees have been renting them for years. The homes are being sold at between $6,000 and $7,000. All are improved and on improved streets.

Workmen in the employ of the Philadelphia & Reading Coal & Iron Co. have started to raze the frame tower over the Bear Valley shaft. The tower was erected more than 25 years ago and is being torn down as a result of a recent discovery showing faulty construction. The tower will be replaced by one of steel construction. Four weeks will be required to complete the work.

The Penn-Lackawanna Coal Corporation, organized in April of this year, with executive offices at 35 Wall St., New York City, has taken over under long-time leases the 600-ton Simpson Breaker and the Lackawanna Mines, in the vicinity of Carbondale; the Tipperary Mines, located at Jermyn, and the Ansley Mines, located near Archbald. This corporation is now operating the Simpson Breaker, near Archbald, and the Lackawanna Mine. It also has plans for the erection of an additional breaker at or near the Ansley Mines and for extensive development of both the Ansley and Tipperary Mines. The officers of the corporation are: President, M. B. Courtright of Philadelphia; vice-president, Wm. J. Jegen; secretary and treasurer, J. F. Limbach, of Hoboken, N. J.

A new electric fan recently put in operation at No. 3 shaft of the Lehigh Coal & Navigation Co., in the Nesquehoning district, has a capacity of circulating 200,000 cu.ft. of air per minute.

**Coalwood, McDowell County, W. Va., Looking Up Snake Root**

This is part of the village attached to plant No. 252, Consolidation Coal Co., Pocahontas-New River division, a few miles over the hills from Gary and Welch, about 5 miles as the crow flies from each.

Steel work has been placed about the new device to protect it from being damaged by falls.

The State Mine Examining Board cannot legally grant a certificate of qualifications to a candidate for the office of mine inspector who has reached his fiftieth birthday, even though he possesses all the other qualifications required by the laws of Pennsylvania. This is the decision of Frank I. Gollmar, a Deputy Attorney General in an opinion to Joseph J. Walsh, State Secretary of Mines, just made public. The opinion cites the laws bearing upon the question which was asked by the mining department head.

Coal mining in the Pigeon Creek Valley, Washington County, where 10 large mines are located, virtually came to a standstill June 25 when the Bethlehem Mines Corp., a subsidiary of the Bethlehem Steel Corp., closed its Marianna and Ellsworth properties. Notices posted said the closing was because of the high production cost. Normally each mine employed about 750 men. For the last few months the mines had been working about three days a week. Eight other mines in this district closed down some time ago.

Continuation of the commissions of the following mine inspectors was announced June 25 by Governor Pinchot: Anthracite—P. J. Moore, Carbondale; L. M. Evans and D. T. Williams, Scranton; Augustus McDade, Taylor; E. C. Curtis, John B. Corgan and T. J. Williams, Kingston; D. T. Davis, Wilkes-Barre; Frank Kettle, Nanticoke; D. J. Roderick and J. J. Stickler, Hazleton; M. J. Brennan, Pottsville; P. C. Fenton, Mahanoy City; William Reid, Centralia; B. I. Evans, Mt. Carmel; P. F. Friel, Shamokin, and Charles J. Price, Lykens. Bituminous—John F. Bell, Dravosburg; C. P. Byrne, Charleroi; P. J. Callaghan, Bridgeville; F. W. Cunningham, Somerset; Nicholas Evans, Johnstown; Edward E. Girod; Masontown; W. H. Howarth, Bridgeville; William Langan, DuBois; Thomas S. Lowther, Indiana; Alexander McCanch, Monongahela; Thomas A. Mather, Tyrone; John I. Pratt, Pittsburgh; C. B. Ross, Latrobe; Thomas B. Williams, Johnstown, and David Young, Freeport.

## TENNESSEE

The twelfth annual field day and miners first-aid contest will take place Sept. 26 at the East Tennessee Fair at Knoxville, under the auspices of the Southern Appalachian Coal Operators' Association, Tennessee Mine Inspectors, Knoxville Chamber of Commerce, U. S. Bureau of Mines and the East Tennessee Fair Association. Valuable prizes will be given the winning teams and there will be a banquet and entertainment for the contesting teams in the evening. R. E. Howe, secretary of the Southern Appalachian Operators Association will have charge of the general arrangements. J. M. Webb of the U. S. Bureau of Mines, will help to train the teams. The contest will be judged by Knoxville physicians. Dr. Kyle Copenhaver, formerly chief surgeon for the American Zinc Co., will be chairman of the judges.

The Signal Mountain Portland Cement Co., of which John L. Senior, James Building, Chattanooga, Tenn., is president, is reported to be about to establish a coke and byproducts plant.

## UTAH

The State Securities Commission has cancelled the stock application of the Two-Ton Smokeless Fuel Co., of Salt Lake City, on motion of the applicant. The proposal was to sell 7,715 shares of common stock at $10 a share.

Coal production in Utah in May totaled 251,874 tons. In May last year 260,586 tons was produced in the state. In April of this year 288,536 tons of coal were produced.

The Consolidated Coal Co., of Salt Lake City, has received a permit from the State Securities Commission to offer for sale 50,000 shares of its stock at $1 par value. The company's property is located in Salina Canyon, Utah. The property has a large shaft 265 ft. deep and about 280 ft. of tunnel extending to the seam to be mined.

On June 17 John Taylor, mine foreman for the United States Fuel Co. at Hiawatha, was appointed an assistant state coal mine inspector. He will work in conjunction with John Crawford, who has been Utah coal mining inspector for several years past. The additional inspector was made necessary by the recent withdrawal of part of the inspection assistance rendered the state by the U. S. Bureau of Mines.

## WEST VIRGINIA

The recent death of Frank P. Harman, of Washington, president of the Turkey Gap Coal Co., necessitated a special meeting of the board of directors at Bluefield on June 17 at which the following officers were elected: James A. McQuail, president and general manager; Oscar M. Deyerle, vice-president; William H. McQuail, Jr., secretary and treasurer. Members of the board of directors are: James Booker Clark, of Baltimore; Clinton DeWitt, Jr., Lynchburg; E. McD. Harmon, Burch; William H. McQuail, Jr., Pottsville, Pa.; James D. Tate, Chilhowie, Va.; Oscar M. Deyerle, Bluefield; Charles K. Robertson, Shamokin, Pa.; James A. McQuail, Lott; Henry M. Sackett, Lynchburg, Va. The company is a West Virginia corporation with a capital of $1,000,000 and a substantial acreage of unmined coal. The company operates six collieries, the Wenonah mines Nos. 1, 2 and 3 and the Modoc, Josephine and Joanna mines with an annual production of from 500,000 to 600,000 tons of Pocahontas No. 3 seam coal.

The Maidsville Coal Co., began operations during the third week of June at the old North American Coal Co., mine at Maidsville, recently purchased at public sale. The property at Maidsville was sold on May 23 to satisfy outstanding debts, the Fiedler Coal & Coke Co., of Morgantown, which held a trust lien against the property, purchasing it for $13,000.

The annual examination for mine foremen and firebosses is to be held by the Department of Mines beginning at 9 o'clock a. m. at the following places and on the dates mentioned: Morgantown, West Virginia University, Mechanical Hall, July 20; Central Junior High School at Charleston, July 27; High School Building, Beckley, July 30; School building at Welch, Aug. 3; High School building at Logan, Aug. 6, and High School Building at Wheeling, Aug. 10.

During the latter part of last week the work of rock-dusting mine No. 41 of the Bethlehem Mines Corporation, near Barrackville, where the explosion occurred March 17, was under way. Early this week the work of rock-dusting the twin plant, Dakota, will be started.

The Thurmond Consolidated Coal Co., was recently organized with a capital stock of $1,500,000, the headquarters being at Logan. This company represents a consolidation of several coal companies in which Walter R. Thurmond and others are interested, all operating in the Logan field.

C. F. Huff, of Greensburg, Pa., has leased the Jerry Run Coal Co. mines, comprising about 63 acres of Pittsburgh coal in the southwestern part of Taylor County, the lease to run for a period of 10 years. According to the best information obtainable the lessee will start operations in a short time, giving employment to about 60 non-union miners.

The Coal Operators Sales Agency has obtained quarters in the recently completed building of the Union Bank & Trust Co. in Huntington. F. W. Schoew is president of the company.

Veazey No. 2 mine, at Robson, on the Virginian Ry., has resumed operations. At the Glen Jean mine, owned by the same company, electric pumps are being installed, and as soon as that work is completed operations will be resumed.

In the Marion County Circuit Court at Fairmont recently the Fairmont & Cleveland Coal Co., which has one of the largest coal mines in northern West Virginia in Parker Run, at Rivesville, was awarded 107 of the company houses, which it will receive possession of July 29. Two houses were awarded in the Dakota mining town to the Bethlehem Mines Corporation in eviction suits.

The total authorized capital stock of the Amelia Coal Co., has been increased from $25,000 to $50,000. These companies have reduced their capital stock: The Deep Hollow Coal Co., from $10,000 to $5,000; Glennova Coal Co., from $50,000 to $5,000; Chesapeake Coal Co., from $1,000,000 to $500,000.

The following West Virginia coal companies have surrendered their charters and discontinued business: The Western Coal Co., M. M. Tyree Coal Co., and the Norwood Coal Co.

There is a shortage of mine labor and miners in the Winding Gulf district, despite the fact that 17 out of 74 mines in that district have shut down, according to an announcement by George Wolfe, secretary of the Winding Gulf Operators' Association.

### WYOMING

The Kemmerer Coal Co. is to install more machinery in its Sublet mines, which will employ about thirty more men. The new machinery, which includes a conveyor, is expected to arrive early in July.

### ALASKA

Anthracite deposits on Chickaloon Ridge, reported last year by the U. S. Geological Survey, will be investigated by the Bureau of Mines. Several permits already have been taken out in the district. It is planned to test the coal on an Alaska railroad locomotive, and if found satisfactory, the product will be mined and shipped in large quantities.

### WASHINGTON, D. C.

Through discontinuance of work and reassignment of duties 23 positions in the Geological Survey have been abolished during the current fiscal year. The annual salaries of these positions amounted to $41,500, and as the work has been discontinued or absorbed among the other employees this represents a yearly reduction in the overhead expenses of the bureau.

The U. S. Civil Service Commission announces an open competitive examination for associate cadastral engineer (qualified in mining engineering) to fill a vacancy in the General Land Office, Department of the Interior, with headquarters at Denver, Colo., and vacancies occurring throughout the United States in positions requiring similar qualifications. The entrance salary is $3,000 a year. The duties of the position are the correlation of surface and subsurface operations under coal, oil and gas leases; the establishment, retracement and relocation of survey lines and corners; the plotting and mapping of the work performed; the making of surface and subsurface surveys of mineral claims and leasing units, and the workings in connection with the supervision of operations, output and royalties. Receipt of applications will close Aug. 4. Full information and application blanks may be obtained from the U. S. Civil Service Commission, Washington, D. C., or the secretary of the board of U. S. Civil Service examiners at the post office or custom house in any city.

### CANADA

Disaffected miners, working in the Drumheller and Wayne coal fields of Alberta, on June 20, decided by a vote of 684 to 132 on the formation of a new local union entirely separate from the United Mine Workers. The total number of miners at present working in the field is approximately 1,800, the majority of the men abstaining from voting at the request of the U. M. W. officials.

Because freight rates have now fallen within the province of the Board of Railway Commissioners, the Canadian National Rys. has withdrawn from the verbal agreement made with the Alberta Government to move 25,000 tons of coal from Drumheller, Alta., to Ontario points at an experimental figure of $7 per ton. The railroad's move is believed to have been dictated by the fear that, if the experiment proved that coal could be moved at between $3 and $4 less than the existing tariff of $11.40, the entire position of the National Rys. in regard to Western freights might be in jeopardy.

Governmental assistance for domestic production of coke from coal mined in Canada is to be provided in a bill prepared by Minister of the Interior Stewart. Not exceeding 3 per cent of the cost of the plants would be advanced by the government.

## Traffic

The New York Public Service Commission has approved new rates of the Delaware, Lackawanna & Western R.R. on coke, coke breeze, coke dust and coke screenings, carloads, minimum weight in open cars 50,000 lb. (except that when car is loaded to full visible or cubical capacity, actual weight will apply, but not less than 35,000 lb.) and in box or stock cars 40,000 lb. rates per net ton from Harriet, to New York, Chicago & St. Louis stations: Angola, Dunkirk, Farnham, Irving, Sheridan and Silver Creek, $1.26 (reduction, 25c.); Ripley and State Line, $1.51 (reduction, 25c.), effective July 24. Also of the New York Central East from North Tonawanda to Harriet, 70c. (reduction, 43c.) per net ton, effective June 22, 1925.

A reduction of 42c. a ton on coal freight rates between Springfield, Ill., and Bloomington, Ill., and a reduction of 27c. a ton on coal between Lincoln, Ill., and Bloomington, Ill., has been ordered by the Illinois Commerce Commission. Present rates between Springfield and Bloomington are $1.42 a ton and between Lincoln and Bloomington $1.18 a ton. The commission directs that the rate from Springfield shall be $1 a ton and from Lincoln shall be 91c. a ton.

## Association Activities

Incidental to the annual meeting of the National Coal Association held at Chicago last week, the **West Virginia Coal Association** held its annual meeting at the same time, at which all the old officers were re-elected, as follows: J. G. Bradley, of Dundon, president of the Elk River Coal & Lumber Co., president; G. H. Caperton, of Charleston, vice-president; Walter H. Cunningham, of Huntington, secretary; C. C. Dickinson, of Charleston, treasurer. Representative coal men from all sections of the state were present at the meeting. Several hours were devoted to a discussion of problems affecting West Virginia operators.

The thirteenth annual outing of the **Cincinnati Coal Exchange** drew a record crowd June 16. More than one hundred sat down to the dinner at the North Cincinnati Gym Club's grounds at Bass Island. As usual, the baseball game attracted most of the attention and for the first time in three years the team represented by men in the low volatile trade, captained by Ed Harper, walked off with the trophy. Harry Jungens pitched for the victors and Ross caught. The High-Volatile battery was Davidson and Justice, pitchers, and Loeb, catcher. The presentation of the trophy was made by Harold W. Coates, Sunday editor of The *Commercial Tribune*. This year there was a long list of athletic events. The three-legged race went to Gerding and Gormlay, who also won the second event, a pick-a-back race. The 100-yard dash was won by Elmer Wierhake, manager of the General Coal Co., while the same event for aged racers went to Fred Heitzman, of the Caster, Curran & Bullitt forces. The team captained by Jack Humphrey won the tug-of-war and H. B. Justice won the shotput. Ernie Howe, a former president of the Coal Exchange, and Jim Reilly, former president of the Chamber of Commerce, were the judges. The Chairman of the Entertainment Committee was Julius B. Ratterman.

At the annual meeting of the **Colorado and New Mexico Coal Operators' Association**, held June 17 at Denver, Colo., the following officers were elected: F. R. Wood, president; H. F. Nash, vice-president; F. O. Sandstrom, secretary, treasurer and traffic manager. The following were appointed directors for the ensuing year: W. D. Brennan, Frank Bulkley, L. A. Hayden, A. M. Johnson, A. M. McNeil, S. S. Murphey, H. F. Nash, J. J. Roche, J. van Houten, J. F. Welborn, and F. R. Wood.

## New Companies

An Ontario charter has been granted to **British Colonial Mines of Canada, Ltd.**, with headquarters at Toronto. The authorized capital is $5,000,000 and Toronto lawyers are mentioned as the incorporators.

**The Red Glow Coal Co.** was incorporated in Denver, Colo., the early part of June, with a capital stock of $40,000, by Ambrose F. Lunney, James B. McGowan and others.

## Obituary

**David Kelso**, age 45 years, who served several years as an associate mine inspector and who was associated with mining operations in the Birmingham (Ala.) district a greater part of the time for the past 35 years, died suddenly from a heart attack on June 21, while on a pleasure ride in his automobile with a friend.

## Coming Meetings

**Atlantic States Shippers Advisory Board.** Seventh regular meeting at Atlantic City, N. J. July 8-9. General secretary, P. W. Moore, 30 Vesey St., New York City.

**Rocky Mountain Coal Mining Institute.** Summer meeting, Aug. 26-29 at Price, Utah. Secretary, Benedict Shubart, Denver, Colo.

**American Institute of Mining and Metallurgical Engineers.** 132d meeting, at Salt Lake City, Utah, Aug. 31 to Sept. 3. Secretary, F. F. Sharpless, 29 West 39th St., New York City.

**Oklahoma Coal Operators' Association.** Annual meeting, Sept. 10 at McAlester, Okla. Secretary, A. C. Casey, McAlester, Okla.

**New York State Coal Merchants' Association.** Annual convention, Sept. 10-15, at Richfield Springs, N. Y. Executive Secretary, G. W. F. Woodside, Arkay Bldg., Albany, N. Y.

**National Safety Council.** Annual meeting Sept. 28 to Oct. 2, at Cleveland, Ohio. Managing Director, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

**Tenth Exposition of Chemical Industries, Sept. 28 to Oct. 3, at Grand Central Palace, New York City.**

**Canadian Institute of Mining and Metallurgy.** Annual western meeting Nov. 3-5, Winnipeg, Manitoba, Can. Secretary, George C. Mackenzie, Drummond Bldg., Montreal, Que., Can.

**Fourth National Exposition of Power and Mechanical Engineering, Nov. 30 to Dec. 5, at Grand Central Palace, New York City.**

**Coal Mining Institute of America. Annual meeting, Dec. 9-11, Pittsburgh, Pa. Secretary, H. D. Mason, Jr., P. O. Box 604, Ebensburg, Pa.**

## Correcting a Misunderstanding

IN OUR ISSUE of Oct. 23, 1924, we published an editorial which by general understanding referred to Mr. George H. Cushing, of Washington, D. C. The editorial in question was an attempt, without malice, to take a humorous view of a situation which had developed some intensity of feeling. Mr. Cushing construed our humor as an assault on his motives and even on his professional standards. The latter question was to him the paramount issue.

While we did disagree with Mr. Cushing on the matter then under discussion, there was no thought of imputing wrong motives to Mr. Cushing in the position he had taken, nor of questioning his professional standards.

In justice to Mr. Cushing we regret that the editorial was open to any misconstruction and withdraw any seeming imputation of motive it contained.

## Still Unrepentant

A FEW WEEKS ago the Federal Trade Commission donned sackcloth and did penance in the open market, but its latest report on anthracite shows that it has not reformed an iota. Its statements being made at the eve of a contest for a new anthracite wage scale seem calculated to encourage the miners in their desire to compel the public to pay a higher wage than that to which the men are entitled. The facts have been published already; why repeat them now?

"In September," says the Commission, "the gross profits realized by wholesalers reporting to the Commission ranged as high as $1.75 a ton and amounted to $1 or more a ton on about 4 to 11 per cent of their reported weekly sales." It will be noted that the Commission does not say how many wholesalers got $1.75 a ton. It is as if a foreigner commenting on our American conditions said: "In the mad race for wealth, in the United States, derelictions ranging even to murder are committed." A true statement but an unfair one. No group is to be judged by a single man.

"Failure of the industry to increase its mining capacity to meet increasing demand has resulted in the establishment of an unduly high price level," says the Commission. This is not a fact. Just at present the production is ahead of the demand. In 1922 there was an actual shortage of coal but, as the Commission says truly, the shortage in 1923 was only anticipated and not actual. At other times there has been a glut of anthracite. The condition for which the Commission prays wherein the mine capacity is equal to meeting periods of extraordinary demand has been with us to a large extent and will be for some time, unless there is a strike. The bituminous region has always been ready to meet such extraordinary demands and strange to say it has been universally condemned for having been thus equipped. Do we understand that the Commission would have the anthracite mines also overmanned and overdeveloped?

The Commission says more mines could be operated. That is true. A *few* mines could be opened but they are in regions where the coal pitches heavily, is badly crushed, is expensive to mine and where the mines will provide mostly small unsaleable coal. As the production is now ahead of demand, why open such mines? Furthermore, there is a glut of small sizes, which are sold at less than production cost at a loss of $75,000,000 yearly. Provided the large sizes could be sold, would it pay to mine the mineral in order to get them if the small sizes in consequence became a drug on the market?

The lack of competition is suggested as a cause of peak prices. Strange to say, in the bituminous market when a shortage comes, the increase of price is greater than in the anthracite trade, the reason being that the old-line anthracite mines are reasonably sure of a fair profit and the operators do not feel justified in asking for as large a price as they can get as is the custom of many independent operators in that region and as is the general practice of the bituminous operators.

## Don't Queer the Loading Scale

YEARS AGO when the machine-cutting scale was being framed some men who didn't want to buy machines for cutting coal advocated a wage scale that took away most of the profit of machines in Illinois. The state and even those men themselves have suffered long from this ill advised policy. When they bought machines, they found themselves confronted by an inequitable wage scale that robbed them of the profits of their enterprise.

The same point of view may present itself to others with regard to the loading-machine scale. Those who do not desire to modernize may try to prevent others from doing so and will lay their state or district open to competition from other states and with oil. If a man does not propose to use loading machines his sole right to action should be to prevent a day scale being proposed that will be lower than other day scales and that, of course, is not likely to be attempted.

Favorable machine scales are needed in union districts if they are to battle with competition. The hand-loading operators should not be selfish enough to prevent this, for if the district does not mechanize on a reasonable basis there will be profit for no one. Certainly the unmechanized will not be able to survive whether the scale for loading-machine men be high or low.

In the formulation of a fair scale the union should join with the operator. The laboring man should do all he can to advocate and assist the introduction of machinery that reduces toil. It should be recognized union effort—one of the axioms of unionism needing neither argument nor proof. Furthermore, the wage should be on a day basis so as to make it impossible for any operator to run his mine without due co-ordination of effort. The hand loader of the past has had to wait too long for cars. How long would he have had to wait had the operator been paying day wages? The introduction of the day-wage basis will be the end of the operator who persists in running his mine without regard for the efficiency of all parts of the operation. The loader should be as assiduously tended as the motor man or tipple hand and such attention will never be paid to his needs till he becomes a day man with his idleness a matter of apprehension to his employer.

We have said this for far more than ten years and the importance of this idea is just beginning to be appreciated. We advocated a combination wage—part day's pay and part a tonnage rate—but, now the argument is being acknowledged, it appears there will be no half way measures but that miners and operators will combine to establish a day wage that puts the whole burden of discontinuity on the operator and gives him all the profit that continuity affords. Perhaps that is not the ultimate solution but it seems at the present the one likely to rule, especially in conveyor-belt, hand-loading mines where the product of each man cannot be readily segregated.

## We Also Believe in High Wages

JOHN L. LEWIS says in his book that the high wages of American workmen are a matter of pride to all Americans. Those men are dead or converted to a better mode of thought, he declares, who at one time advocated low wages. We can rejoice that Philadelphia pays more than twice the wages paid in London, three times the wages paid in Paris and nearly five times the wages paid in Rome, Madrid and Vienna. We hope these large wages will continue. We are sure they will. They represent a high productivity of labor and capital, greater than is attained in Europe.

Mr. Lewis may not have stated a fact when he said that high wages in themselves constitute Americanism, but it is true that they reflect an enterprise that is typically American. We hope the spirit of untrammeled achievement will be continued, that the store of natural wealth that aids such achievement will not be too rapidly depleted and that as the result of the energy of unfettered industry remaining relatively unchecked and the riches of the earth not being unduly exhausted, we may continue to see high wages in America for many years.

Herbert Hoover is reported to have said at the conference in the Hotel Ambassador, New York City: "It has always been my belief that the test of civilization is the scale of living of its whole people." In this all will agree but—

It does not follow that we rejoice when, by a combine and strikes that paralyze the country, any body of men obtain a wage that they could not get by supply and demand and make the public pay for the product more than is properly due. We do not rejoice in any such achievement. If it is Americanism, as Mr. Lewis volubly contends, it is not the kind of Americanism of which we are proud.

It does not follow that we rejoice when high wages make coal suffer in competition with the oil for domestic purposes.

It does not follow that we rejoice when an undue wage rate makes it possible for workmen to live on two days' work a week while others who have to buy their product must work six or run in debt.

It does not follow that we rejoice when we find one section of the coal field able to take the business entirely away from another by paying merely a normal wage while the other section pays a supernormal one.

It is not a contribution to Americanism when one industry, the anthracite, with an hourly wage that was already higher in 1914 than was paid in other industries, gets an increase in wage of 192 per cent in ten years while the manufacturing industries get an increase of 129 per cent, the railroads one of 141 per cent, the illuminating gas industry one of 111 per cent and the electric light and power one of 121 per cent, as is shown in the National Industrial Conference Board's report which we published last week.

Now, we hear, that these highly paid men want yet more pay. The miners are asking a 10 per cent increase, and the day laborers a wage advance that in some cases runs up to 21.75 per cent. In addition there are other provisions that are somewhat difficult to evaluate, such as weight allowances and payment for the placing of sheet-iron, props, timber, forepoling, abnormal shoveling and rock, free lights, jackhammers and air to operate them, so that the increase demanded *may* average 30 per cent or more which on the basis of the pre-war, 1914, rates is 88 per cent, bringing the increase if granted, which it will not be, up to 282 per cent above the pre-war figure, twice the increase obtained by railroad men, the group that next to the coal miners got the largest rate of increase.

This is not Americanism; it is the new feudalism—the outcome of a privileged era for that kind of unionized labor that believes that all is right, if you can "put it over."

## The Man with Two Prices

HARDLY ANY REPUTATION is worse for an operator or a wholesaler than to be a man who sends out his salesmen to get as large a sum for his product as he can above a certain base price. But that is how coal is often sold. In fact the salesman is commended who "stings" an unsuspecting, uninformed buyer. At such times as the present the salesman usually is in the home office at least once every day trying to get a price to quote that entirely wipes out profit.

Where a company is not a one-price firm, every buyer is trying to beat down its price. Quality is not considered. Price is the sole thought. In fact the buyer does not believe that a product sold by haggling is a high-grade product. He usually *does* think that—and *just* that—of a commodity sold at a fixed price. Coal is enough different so that the buyer who finds a set price immediately concludes he has lighted on a superior article; whereas, if there is a variable price the purchaser assumes that the producer or wholesaler has an article that he has difficulty in selling. And the assumption is correct.

Two prices do not pay. It may be well to lower prices or raise them but not to vary them for any particular customer. The same price for all closes contracts quickly, saves selling costs and enhances the standing of the seller and the reputation of the goods. The word of power is, "You can't get *my* coal for any such gyp figure." The companies selling coal throughout this country should have the moral strength and business acumen to instruct salesmen to have no other selling policy, despite fierce competition.

# Rock-Dust Barriers Have Important Part to Play In Protection of Soft Coal Mines

### Bureau of Mines Engineer Declares for Drop-Bottom Type with Distant Tripping Vanes—Covers Keep Dust Dry and Ready—V-Troughs Have Many Disadvantages

**By George S. Rice**
Chief Mining Engineer, U. S. Bureau of Mines,
Washington, D. C.

THE RAPID ADOPTION of rock dusting as a means of forestalling mine explosions has recently brought consideration of dust barriers as a supplementary preventive agency strongly to the front. This article traces the history of the dust barrier, its various applications and will describe the type of barrier which is now considered to be the most effective. It is of the drop-bottom type, actuated by vanes located at a distance and is covered with sheet iron to keep the dust dry.

A shale-dust, flame-arresting barrier (*"arrêt-barrage"*) was the first suggestion for the prevention of coal-dust explosion propagation, growing out of the investigations conducted at Liévin, France, by Taffanel. The principle involved was the concentration of masses of incombustible dust at intervals throughout the mine passages, designed to extinguish the flame by coking and interposition, thus arresting propagation, rather than generalized rock dusting as first proposed by Sir William Garforth and intended to prevent first ignition. Taffanel's initial recommendations were for the employment of ten shelves, each 20 in. wide, extending across the passageway, near the roof, on which the inert dust was to be piled.

When large-scale coal-dust explosion testing was begun by the Bureau of Mines under my direction, at the Experimental Mine in 1911, Taffanel barriers were used to lessen the force of explosions or to stop them at the end of a predetermined test zone.

It was found in hundreds of trials in which these barriers were used, that while in a great majority of cases they were successful, especially after more shelves were used than had been originally prescribed, nevertheless they sometimes failed when the explosion wave had so little force as not to displace the dust, or when the explosion movement was extremely rapid but lacked violence. This latter condition may be encountered with a road dust of high ash content, with a small percentage of fire damp present.

The loaded Taffanel barrier presents a V-shape to the approaching pressure wave. This is not conducive to displacement of the loading. Furthermore, as the shelves are fixed, considerable violence is necessary to rupture and discharge the load. In the explosion disaster which occurred in the La Clarence Mine, Pas-de-Calais, France, in 1912, some of the original Taffanel barriers failed. This caused Mr. Taffanel to increase the number of shelves in each barrier to fifteen, and in subsequent practice throughout France, still more shelves have been added. They, however, were made narrower and balanced on a narrow support so that they would tip over and launch their contents under the action of a relatively weak air wave.

The La Clarence failure and certain other shortcomings demonstrated by tests conducted at the Experimental Mine at Bruceton, Pa., led me to develop in 1912 to 1915 what I termed "closed" barriers which would operate under the action of a smaller force than was necessary with the Taffanel design. The latter types of these closed barriers, tested at Bruceton, were almost universally successful. They are described in Technical Paper 84 (U. S. Bureau of Mines) published in 1915, and subsequently in Bulletin 167, in which are given the full results of the various tests.

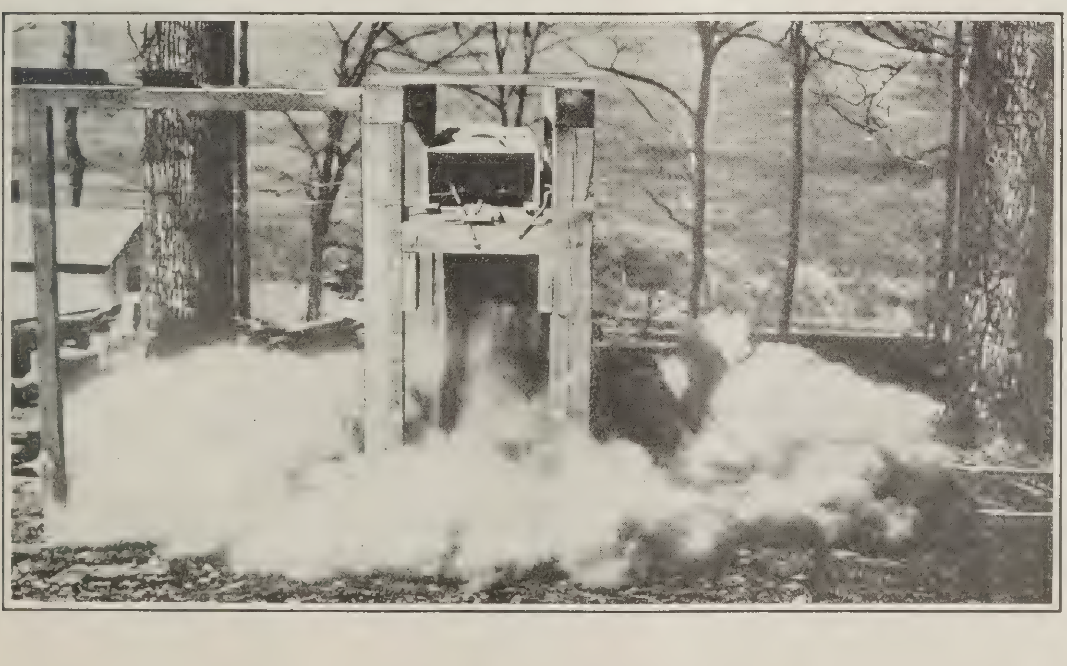

FIG. 1

**Tripped in the Open**

This shows the effect of springing the mechanism of a trough barrier carried on a frame built up above ground. In actual operation it is essential that the rock dust contained in a barrier shall fall in such a way as to form a continuous curtain extending entirely across the heading and persisting for an appreciable length of time so as to effectively smother any explosive flame.

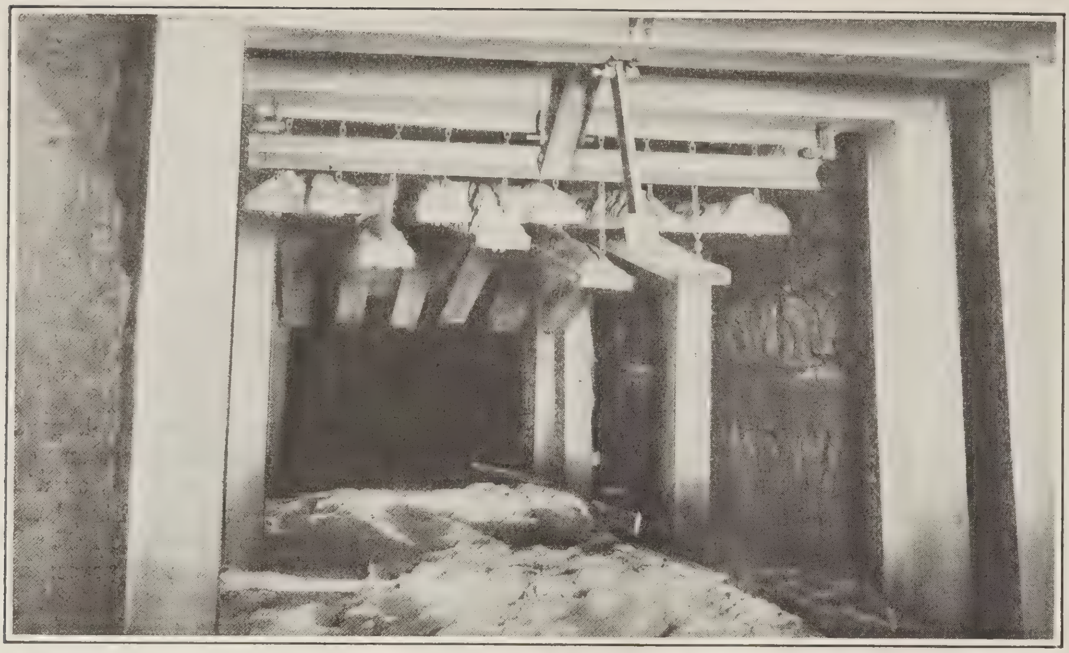

FIG. 2

**After a Light Blast**

Here is a type B concentrated barrier as it appeared after a light explosion. This kind of barrier is tripped by advance vanes and spills its dust in a whole series of sheets that persist until the explosive wave arrives. The flame thus is effectively blanketed and smothered. If the explosion is not violent no particular damage is done to the barrier.

The British have adopted generalized rock dusting on the theory that it is much better to prevent "ignition" than to try to stop "propagation." The Bureau of Mines' investigators conceded that this was a fact, but they believed it highly desirable to have secondary defenses. It is much easier to employ rock dusting successfully in mines using the longwall system, which prevails in Great Britain, than in the room-and-pillar method almost universal in this country.

In longwall workings old roads are cut off and there are no extensive open gobs, whereas in room-and-pillar work, generalized rock dusting is not so easily accomplished under many mining conditions. Moreover, in the longwall system the road ribs are rock, which entails some natural rock dusting. In room-and-pillar work, on the other hand, the sides of the passageways have ribs of coal, and sometimes the roof is of the same material. This increases the formation of coal dust through abrasion or spalling. Carrying rock dusting to the faces of rooms in old workings, or even into airways in which there are no tracks, is a difficult problem in such mines.

There is also the complication that where watering is employed in connection with undercutting and especially where its use is compulsory at all the faces, as is the case in Utah, the air in the rooms and return airways is extremely humid. This is not conducive to the maintenance of dry rock dust, although it has been found experimentally that any inert dust that is distributed helps in the wetting of the coal dust through contact. That is, it has been demonstrated by experiment that a mixed coal and rock dust becomes wetted rapidly, whereas coal dust alone resists wetting.

As long as rock dusting in this country was considered as being academic—since with few exceptions it was not practiced until about two years ago—the technique to meet the special conditions encountered in American mines was not developed. Recently, however, great advances in this direction have been made.

With the wide adoption of rock dusting during the past year—its use as an alternative for watering being made mandatory in Utah, while similar legal measures are being seriously discussed in other states—the question of barriers has become increasingly important. Field investigations and direct inquiries from operators have developed the following important applications of barriers:

(1) To isolate old workings, especially those on the ventilation return, so as to prevent the propagation of an explosion originating in adjacent active workings or one starting in workings that have been abandoned either temporarily or permanently.

(2) Protection of airways and manways on which no tracks have been laid, especially those ventilated with return air which carries and deposits fine float dust from the active workings. This applies particularly where the roads are not sufficiently close to haulageways or there are no connecting cross-cuts which will permit rock dusting through the stoppings.

(3) For the protection of panels. For this purpose barriers are placed at entrances and exits so that if an explosion of gas or coal dust occurs within the panel, it may be stopped at the points of egress and not reach other parts of the mine, or vice versa.

(4) As an auxiliary to general dusting, barriers may be placed at intervals in main roadways which make coal dust rapidly through topping falling from trips, and being pulverized under the action of traffic. When so placed as to protect haulageway zones, barriers form an especially valuable secondary defense; for example, in case the dust in any zone increases in combustible content to the danger point before the next cleaning up and rerockdusting in that zone takes place.

(5) Temporary barriers may be placed in the vicinity of working faces where it is not deemed feasible to rock dust or where watering is employed to supplement dusting. Such barriers are moved ahead as the face advances.

The Bureau of Mines has recommended designs for closed barriers covering the first four of the above applications, although doubtless new plans may be devised that may prove cheaper to construct and still be effective. Practical application to the fifth case has not yet been satisfactorily worked out.

Generalized rock dusting depends upon the following principles: A coal dust explosion can propagate itself only by the constant raising of a dense cloud of inflammable dust ahead of the flame. Some have thought that the combustible dust normally present in the air of a coal mine might propagate an explosion. This, however, is not the case. In order to propagate explosive inflammation a cloud of coal dust must be so dense as to be impenetrable to vision. The air waves ahead of the explosion, termed advance or "pioneering waves," constantly stir up the dust in front of the flame and permit its continuous explosive combustion.

An explosion may die away or be extinguished by any one of three means:

(1) No combustible dust may be present over a considerable distance of passageway; it has not been found feasible to maintain this dustless condition in mines.

(2) The dust may be so thoroughly wetted that it will stick together or to the walls and will not be raised by a blast. This requires from 20 to 30 per cent of water—30 per cent for the finest dust not including the water of composition, thus signifying a condition of mud.

(3) Explosive combustion may be prevented from proceeding, by the introduction of inert rock-dust particles which absorb heat and also act as a curtain between the particles of coal dust.

### ADVANCE AIR WAVES MIX INERT DUST

In this third preventive measure, the well-known rock dusting method, the inert dust is applied in such quantities and in such position that the air waves, which always precede a coal dust explosion and in fact make it possible, will bring up and mix the inert dust in the air at the same time they throw the coal dust into suspension.

The underlying principle upon which barriers operate is that they launch suddenly so much inert dust into the advance air waves that instead of the explosive flame being extinguished gradually over a long distance, it is almost immediately quenched by the great excess of inert dust concentrated at that point.

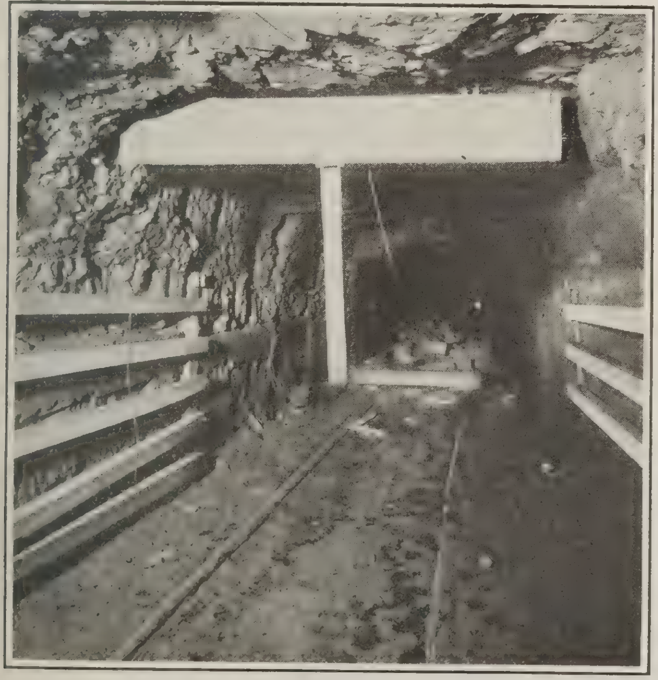

**Fig. 3—Effect of a Violent Explosion**

Heavy explosion waves may completely demolish a dust barrier. This is of decidedly secondary importance, however, as the primary consideration is that the propagation of the dust explosion shall be stopped. This is the entire object of any barrier.

When the rock-dusting method began to be used several years ago, some mining engineers and operators who had read of barriers or seen them successfully used in extinguishing test explosions in the Experimental Mine, accepted the general idea but apparently did not fully understand some of the vital factors of design. They, accordingly, either modified the Bureau's designs or made entirely new ones of their own.

One of the types favored because of its cheapness was the V-trough barrier which had been extensively used at Bruceton, although not considered by Bureau investigators as being the best design. Certain alterations were introduced. Thus the V-troughs were made much smaller and the spaces between them were narrowed. This arrangement is reported to have been successful in stopping a number of explosions in the Middle West. It has not been followed by the Bureau in the designs which recently have been extensively introduced in the Rocky Mountain field.

Undoubtedly, many mining engineers and operators will devote some attention to designing barriers. It is for this reason that I here present what I believe should be the principles governing such designs:

(1) Preference for the so-called "closed" barrier, over the Taffanel shelves, rests upon the fact that the former prevents the inert dust loading from becoming wet in the presence of humid air which would nullify its usefulness. It also obviates contamination by floating coal dust. To accomplish this end the inert dust should be completely inclosed and if the barrier is not placed tightly against the roof at a point where it is dry, it should have a cover of galvanized iron or its equivalent. Oilcloth has been used at the Experimental Mine and has served successfully over a long period. In the returns of certain other mines it has shown a tendency to rot.

(2) A barrier should be so sensitive that an air wave exerting a pressure of only 2 or 3 lb. per square inch (as measured at right angles to the direction of travel) will cause it to operate. A V-trough barrier as ordinarily installed does not meet this condition. The small V-shaped containers do not present enough surface and the sides of the individual troughs are inclined and consequently do not stand at right angles to the advance of the air wave. Furthermore, the bottom edge is held by the V-notch which simultaneously acts as a support and a hinge. Supplementary vanes, such as a vertical board on top of each trough, would increase their sensitiveness to shock waves and aid in their capsizal.

(3) In some cases an explosion may start strongly, as by a blown-out shot or an ignition of fire damp. Strong air waves are thus initiated, but the coal dust inflammation which may follow, at first may proceed slowly so that the combustion zone lags far behind the pioneering air waves that move at the rate of sound (1,100 ft. per second). To provide for such a case the barrier should not dump *en masse* but should be so arranged that much of the dust will sift down gradually or cascade over bars or grids so as to remain in suspension until the combustion wave arrives. This condition is not met by the original Taffanel barrier nor by the simple V-trough, which discharges its load *en masse*.

(4) To provide for extremely rapid flame propagation, as in a main haulageway where the explosion may travel at the rate of 3,000 or 4,000 ft. per second, it is important that tripping vanes should be located about

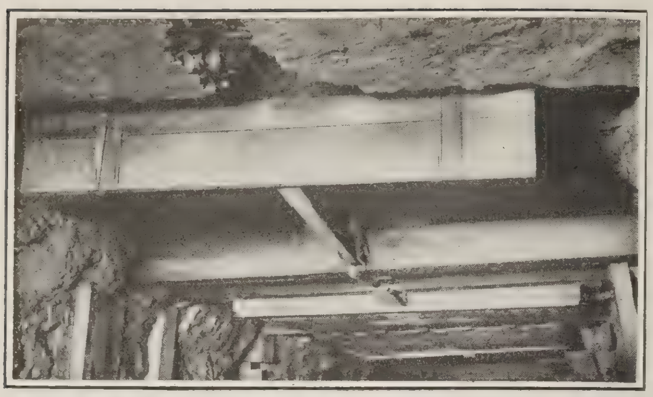

**Fig. 4—"They Shall Not Pass"**

Barriers, in reality, are deadfalls deliberately set in the runways of mine explosions. If properly constructed and maintained no explosion, regardless of its direction or speed of travel, can get by. This illustration shows a trough barrier with its operating vanes ready to throttle and kill any mine disaster of this kind that may traverse this heading.

100 ft. in advance of the barrier. This distance the Bureau's experiments have shown to be sufficient to start the mechanism in motion for dumping the barrier in ample time. The barrier, however, should not be entirely dependent on such vanes; there should always be supplementary means for tripping it, in case any accident should befall the advance vane or the wires connecting it with the barrier.

Such vanes should be scientifically proportioned so that they will not trip under the action of any small shock wave such as that set up by the slamming of a ventilating door, by a high pressure ventilating current or by disturbances caused by distant blasts of explosives. A vane should be operated unfailingly, however, by the shock wave of even the lightest, slowest-moving explosion, such as may occur when the combustible content of the air is near the lowest limit permitting flame propagation.

(5) The arrangement of the barrier should provide for a minimum delay in launching the load of dust. This can be accomplished most effectively by providing for discharge of the dust at the bottom. This condition is not met by either the Taffanel or the V-trough barriers. The latter must swing through an arc of about 90 deg. before the rock dust load even begins to discharge.

(6) Taffanel tests in France, as well as those conducted by the Bureau of Mines in this country, have indicated that the loading of the barrier, or set of individual units which make up a barrier, should be about 100 lb. per square foot of entry cross-section. Such a loading should be somewhat increased if the cross-sectional area is less than 50 sq.ft. and perhaps somewhat decreased if it is greater than 60 sq.ft. This loading is deemed necessary except where there is supplemental rock dusting in the immediate vicinity, in which case the amount of dust may be somewhat lessened.

(7) Dust for loading a closed barrier may be any kind of dry, inert material, 50 per cent of which will pass through a 200-mesh screen. Inasmuch as this dust will not normally enter into the mine air and be breathed by the workmen, it need not be non-siliceous as is the case in generalized rock dusting. It is desirable, however, to use for closed barriers a dust that has no hygroscopic qualities. That is, one which will not tend to absorb moisture.

(8) The material of which any barrier container is made usually will be wood. If, however, the barrier is located in an extremely wet or humid place, it may be desirable to make the sides and cover of galvanized iron or some similar material.

(9) Any closed barrier, if used in a haulageway or manway, should be so arranged that if it should be accidentally tripped men underneath will not be struck by the moving parts. In some cases this may necessitate recessing the barrier into the roof, although usually a place can be selected where the natural roof is sufficiently high.

(10) In locating a barrier, if there is any choice of position, it is advisable to avoid places where the roof is unusually high or where the width is excessive, but to locate it at some point on the roadway where the cross-sectional area is not over 60 to 70 sq.ft. Ordinarily the barrier units should not be more than 8 ft. wide and it is desirable to have the bottom of the barrier not over 7 to 8 ft. above the floor. An explosion passing through a place of this kind will have such velocity that the pioneering air waves will thoroughly mix the inert dust loading in the air, whereas if located in an extremely high place the mixing may not be so thorough and the explosion may pass over or under the barrier. In explosions of a feeble character, as demonstrated by the tests in the Experimental Mine, the flame usually does not completely fill the passage, yet the heat and gases would prove fatal.

## BARRIERS MEET SPECIFICATIONS

These suggested specifications for closed barriers are met by the Bureau of Mines' bottom-dumping trough barriers (not V-trough) and by the concentrated barriers detailed in the plans of Technical Paper 84 and Bulletin 167. Both these designs employ advance vanes and also supplemental tripping arrangements at the barriers themselves.

No doubt other designs will be evolved from time to time. Eventually it may be desirable, as knowledge of this subject grows through the application of barriers in commercial mines, that the Bureau of Mines establish permissibility specifications, like those for explosives and electrical machinery intended for use in dusty or gaseous operations.

---

### Boy Gets Thrill

Boys living at Blue Diamond, Ky., had no chance to ride airplanes so that they took their air thrills by riding short distances on the traction rope of an aerial tramway used by the Blue Diamond Coal Co. This sport went on unknown to the coal company until one day recently when a 10-year-old boy grabbed the rope ahead of the bucket, failed to let go soon enough and was carried out across the 200-ft. deep valley, over a burning refuse dump and into the top of a 90-ft. dead-end tower shown in the background of the accompanying picture. There the lad let go just in time to avoid getting mangled and snatched a hold on the tower structure. He climbed down to home and mother Tram riding has ceased

# Mining Method Cuts Cost in Steep Anthracite

## Each Chain Pillar in Nearly Vertical Kidney Bed Serves as Battery for Breast Above—Maintenance of Gangways Is Low—Coal Boxes Support Hanging Wall at Wanamie

By **Dever C. Ashmead**
Anthracite Mining Engineer, U. S. Bureau of Mines,
Wilkes-Barre, Pa.

GENERALLY SPEAKING, steep-pitch mining in the Pennsylvania anthracite region is associated with the Southern, Eastern Middle and Western Middle fields. In certain portions of the Northern field, however, may be found comparatively small areas which require this type of mining. The methods here employed, though following the same general lines as those of other fields, differ from them more or less in detail. The engineer familiar with the flat mining of the Northern field when confronted with steep-pitch operations is liable to introduce variations to the methods usually followed that may or may not be of value to his brother engineer in other fields. This paper discusses conditions and the methods adopted at the Wanamie Colliery of the Lehigh & Wilkes-Barre Coal Co. at Wanamie, Pa., where gangway maintenance is low and costly batteries at main breast mouths are unnecessary. The section of the workings particularly referred to is that which lies in the No. 45 tunnel area of the Kidney bed. Fig. 1 is a map of this locality.

The coal here ranges in thickness from 5 to 7 ft. and the pitch from about 17 to 90 deg., as is shown in the accompanying cross section, Fig. 2. The particular part of the workings that will be described is that where the Kidney bed is standing vertical.

### STRUCTURE OF ADJACENT STRATA

The top rock or hanging wall consists of a mixture of coal, bone and slate, which ranges in thickness from 3 to 5 ft. Immediately above this, the main roof is a sandy slate. The foot wall or floor of the bed is soft sandstone. At the particular point shown, the gangway is approximately 300 ft. below the surface. The coal is of a shelly nature, but does not run as it does in some places in the lower coal fields. A sample, taken near chute No. 7 in the monkey heading, and analyzed at the Pittsburgh Station of the Bureau of Mines, showed the following results:

| | Coal, Air Dried | Coal, As Received |
|---|---|---|
| Moisture | 0.9 | 12.0 |
| Volatile matter | 5.4 | 4.8 |
| Fixed carbon | 82.1 | 72.9 |
| Ash | 11.6 | 10.3 |
| | 100.0 | 100.0 |

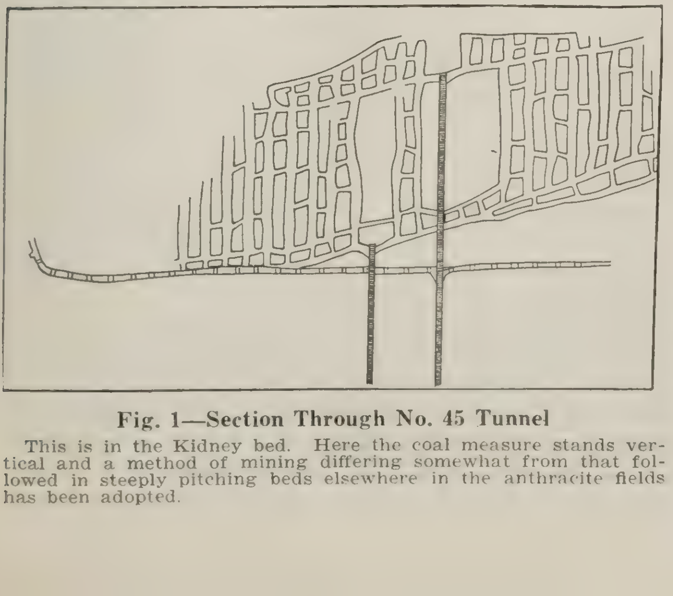

Fig. 1—Section Through No. 45 Tunnel

This is in the Kidney bed. Here the coal measure stands vertical and a method of mining differing somewhat from that followed in steeply pitching beds elsewhere in the anthracite fields has been adopted.

Gangways are driven in the coal 12 ft. wide and 6 ft. high clear of the rail. Chutes are turned off the gangway every 50 ft. and are driven 12 ft. wide. Thirty feet in the clear above the gangway a monkey heading is driven, that is, leaving a pillar 30 ft. thick between the passages. Breasts 24 ft. wide are turned off of this monkey heading on 50-ft. centers, leaving pillars between 26 ft. thick. The center lines of the pillars are directly over the centers of the chutes, as shown in Fig. 3, thus bringing the breasts directly over the centers of the chain pillars between the gangway and the monkey heading. This arrangement obviates the building of a battery at the mouth of each breast, for the coal in the box that is constructed in this opening rests directly on the chain pillar.

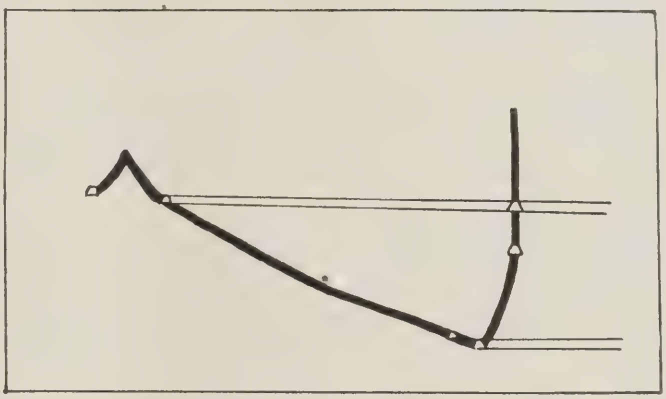

Fig. 2—Section of the Kidney Bed

At this point the gangway is approximately 300 ft. below the surface and the bed stands practically vertical. All passages are driven within the coal, leaving the rock of both foot- and hanging-walls intact.

After the gangway has been driven, a concrete stopping is built in each crosscut. This is poured from the top, the old wooden stopping being used as the bottom of the form. Two holes are left in the stopping so that material may be taken through for its construction. As soon as the stopping has been poured, however, these holes are sealed. When it is desired to reopen them all that is necessary is to knock out the wooden frame. A cross section of a crosscut is shown in Fig. 4.

When the time comes to commence driving a breast the two holes in the concrete are opened. One of these is about 8 ft. wide and serves as a coal chute. The other hole serves as a manway, being just wide enough for a person to pass through. A trap door is made

---

This article is published with the permission of the Director of the Bureau of Mines, Department of the Interior.

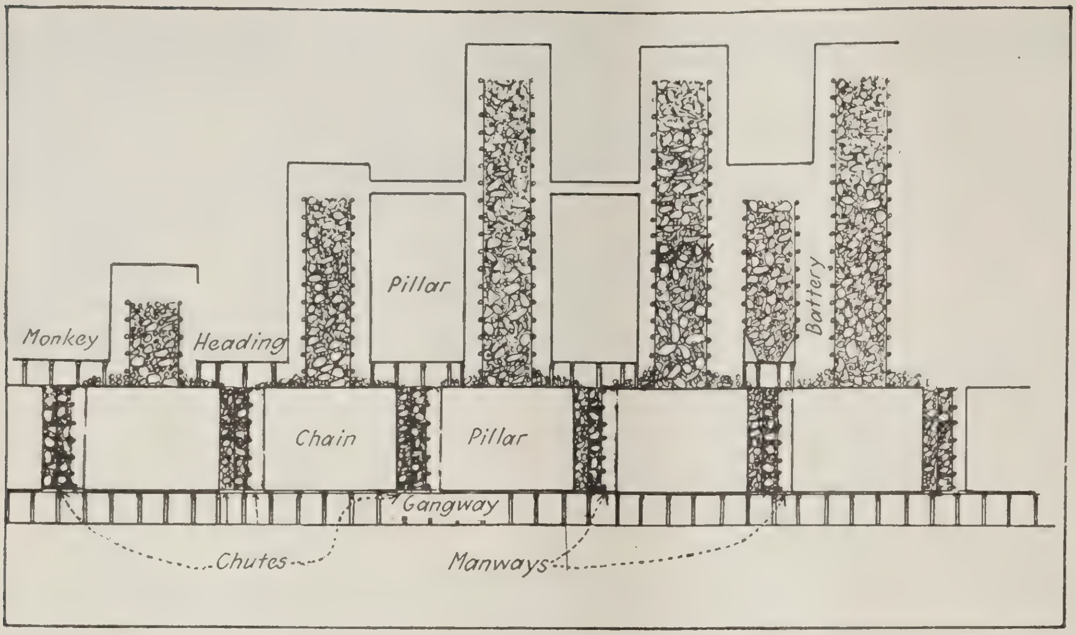

FIG. 3

**Details of Mining**

Above the gangway a monkey heading is driven, the two passages being connected by chutes. Above each pillar between the monkey and main heading a breast is driven upward, a coal box being carried up its center. This is kept full and gives footing for the miners as the breast advances. Surplus coal is shoveled over to the chutes upon either side from which it is drawn off into mine cars in the main heading.

to fit over this latter opening so that the air will not be short-circuited by it. When the chutes are filled with coal they act as stoppings.

Lagging on top of the timbers in the main gangway is made sufficiently strong so that it acts as a battery. When it is desired to load cars from the chutes, some of this lagging is removed, allowing the coal to pass from the chute into the mine car.

As previously stated, the center lines of the breasts coincide with the center lines of the chain pillars between the gangway and the monkey heading. This means that directly opposite the end of the breast is the face of a pillar. Consequently, each pillar becomes the battery for its breast. In starting the breast a shot is fired in the roof, immediately over the monkey heading, so that ventilation will be maintained. When the next round of holes has been drilled, the coal is shoveled into the nearest chute, after which the coal box is started and by the removal of coal, space is provided for the circulation of air through the monkey heading. As driving of the breast proceeds, the box is built upward so that the men have the coal in it upon which they can stand while working at the face. The box is kept constantly near the face and always full. Surplus coal mined while the breast is being driven is run down the manway and drawn off into the coal chutes from which, in turn, it is periodically withdrawn to mine cars. No coal is drawn from the bottom of the battery until the breast is finished.

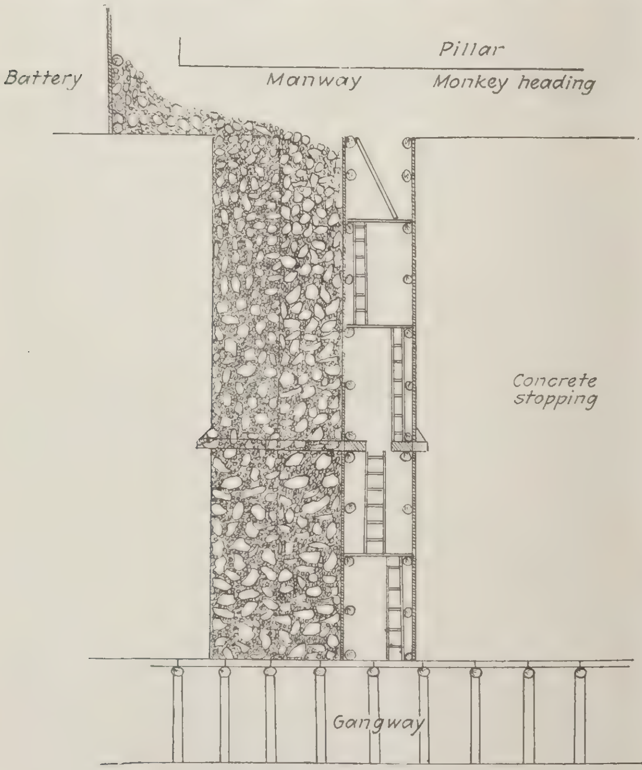

**Fig. 4—Details of the Coal Chute**

A heavy concrete stopping is built across this vertical passageway. This contains two openings. The larger of these permits the passage of coal but this material serves to plug this opening so far as the circulation of air is concerned. The smaller hole is used as a manway, the air being controlled by means of a trapdoor cover.

In the lift nearest the surface no reserve pillars are left. In the next lift below, however, two adjoining breasts out of every ten are left in place as a reserve pillar, thus forestalling the development of a squeeze and preventing any movement of the ground from traveling any appreciable distance.

Hand machines are utilized for drilling coal and jackhammer drills are employed in rock. Monobel is the explosive used, with cap and fuse to detonate it.

After the breasts have been finished in a section of the heading, second mining will be commenced. Two triangular pillars of coal are to be left immediately above the chute opposite the last pillar, one on each side with a battery placed between them. Next a box will be carried up as the pillar breast advances, until it reaches its limit. Then the coal from the breast on the outside of the one just driven will be drawn. While this is being done, a breast will be driven in the next pillar and the coal then drawn from the box in the breast just completed in the previous pillar and so on until all of the pillars have been mined out and the boxes drawn.

The chain pillar will be drawn back as rapidly as second mining is completed so that the gangways will not have to be maintained for any unreasonable length of time. The main saving effected by this method of mining results from the fact that it is not necessary to build expensive batteries at the mouths of the main breasts.

# Synchronous Apparatus Can Improve Power Factor

## Whether a Coal Company Generates or Buys Energy Much Loss and Expense in Alternating-Current Circuits May Be Avoided by the Use of Proper Corrective Devices

**By R. C. Muir**
Assistant Engineer, Industrial Dept. General Electric Co.,
Schenectady, N. Y.

THE IMPORTANCE of maintaining good power factor conditions in the alternating-current power circuits at coal mines is as great as in any other industry. Whether a coal company generates its own energy or purchases it, the operating power factor of its lines affects power costs thus reaching into the expense of producing coal. Investment in power-factor improvement devices might make much heavier expenditures for additional equipment unnecessary, not to speak of other savings to be mentioned in this article.

Before defining power factor, it might be stated that, in most alternating-current systems, the current lags behind the voltage, chiefly on account of the magnetizing current of transformers, induction motors, control equipment and other devices. This magnetizing current is a reactive current lagging 90 deg. behind the voltage, whereas the active current is in phase with the voltage. The total or actual current in the line is the resultant geometric sum of the two, the reactive current and the active current being its two components.

Referring to Fig. 1, which is a simple vector diagram by which most power factor problems can be solved, *OI* is the actual current; it lags behind the voltage *OE* by the angle $\phi$. The active component in phase with the voltage is *OX* and the reactive component 90 deg. out of phase is *XI*. The power factor of a circuit is the ratio of the active component of the current to the actual current, or the ratio $OX \div OI$ which is the cosine of angle $\phi$.

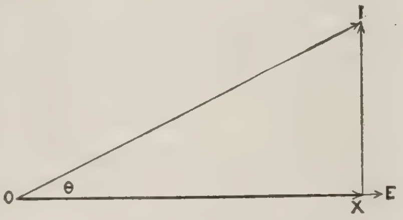

**Fig. 1 — Illustration of Power Factor**

The actual current in the line (*OI*) is made up of an energy component (*OX*) and a reactive component (*XI*).

The common definition of power factor is the ratio of the true power to the apparent power. The apparent in a three phase circuit is $\sqrt{3EI}$, which is kilovolt-amperes (kva.); the actual power is $\sqrt{3EI}$ cosine $\phi$, which is kva. times power factor and gives kilowatts (kw.). It is apparent that kilovolt-amperes and kilowatts are one and the same thing at unity power factor and that, for power factors other than unity, the current for a given kilowatt load increases inversely with the power factor.

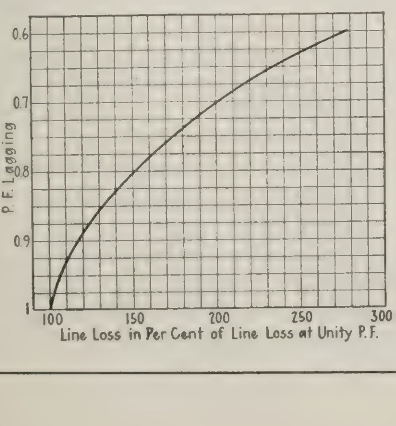

**Fig. 2 — Losses Rise With Poor Power Factors**

Even with a 70 per cent, constant, power-factor load the line loss is double what it would be at unity power factor.

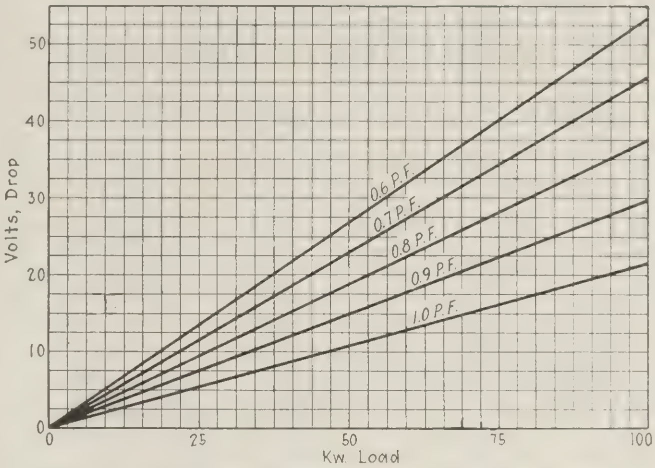

**Fig. 3—Line Losses on a 1,000-Ft., 440-Volt Line**

As the load increases, the line loss increases regardless of the power factor, but note how rapidly the line loss becomes greater when the power factor is poor.

Generators, transformers and power lines are limited by their current carrying capacity. Consequently, leaving aside certain other undesirable effects of low power factor on generator design and voltage regulation, the true power load which a given generator, transformer or line may carry is proportional to the power factor. In other words, the kilowatt load that can be carried at 80 per cent power factor is only 80 per cent of the kilowatt load that could be carried at unity power factor.

The investment in generators, transformers and lines, therefore, increases as the power factor decreases and, when this involves additional equipment, particularly underground cables, the increased investment mounts rapidly.

The $I^2R$, or heat loss is proportional to the square of the current and, consequently, increases inversely as the square of the power factor. Fig. 2 shows the relation between power factor and line loss for any circuit when carrying a constant kilowatt load. Fig. 3 shows the actual line loss for a 1,000-ft., three-phase, 60-cycle, 440-volt line of No. 0 wire at various loads and power factors. These curves terminate at the safe current-carrying capacity of this particular line and the various curves show clearly the increased line loss at the lower power factors as well as the decrease in safe load-carrying capacity with decrease in power factor.

The voltage drop increases rapidly with decreasing power factor, depending on the resistance and reactance of the line. Fig. 4 shows the line drop in a three-phase, 60-cycle, 440-volt circuit, 1,000 ft. long with 9-in. spacing consisting of No. 0 wire. It will be noted that the drop increases more rapidly than the power factor decreases, which, in turn, is due to the reactance of the circuit. This circuit might be considered as typical. The actual volts drop in the circuit carrying various loads at different power factors is shown in Fig. 5. These curves are intended to give a picture of the effect of the reduction of power factor and are not intended to be used in actual calculations.

Usually a 10 per cent variation in voltage either way from normal has very little effect upon the operation of induction motors other than upon the slip. Voltages below normal reduce the speed of the motor and, consequently, affect production adversely. The torque of induction motors varies with the square of the applied voltage; consequently, if the voltage drops more than 10 per cent below normal, it is not only the abnormal reduction in speed due to increased slip that becomes serious, but also the likelihood of stalling the motors and other apparent disadvantages, such as lower efficiency and over-heating of the motor. Other disadvantages of abnormally low voltage, such as poor lighting, are too well-known to be discussed here.

Consequently, low power-factor circuits require expensive voltage control equipment or the voltage regulation is inferior, and operating and production difficulties arise. It is evident, from this, that power factors other than unity involve additional investment in generators, transformers, lines and regulating devices.

The supply of reactive current, incident in power factors lower than unity, should be considered a service rendered by the power house, and a charge for it is entirely justified when based upon the expense involved. This is being done by a large number of power companies and, undoubtedly, a more or less uniform method of determining this charge will be adopted eventually. This is sometimes spoken of as a penalty, but it is not really a penalty but an additional charge for additional service for supplying the reactive load.

It is apparent, from the disadvantages of low power factor, that there are corresponding advantages of good power factor and, therefore, it is to the advantage of the power user, whether he generates his own power or purchases it, to obtain the highest possible power factor consistent with economy. It is a problem of balancing the benefits obtained, such as lower power costs, lower investments within the plant and improved operating conditions, against the increased cost of equipment necessary to improve the power factor.

The advantages obtained naturally depend largely upon the particular cases. Almost unbelievable results are obtained where conditions of the existing equipment and distribution system have become critical because limitations of current-carrying capacity have been reached and conditions of operation have become so bad due to low voltage that something had to be done immediately.

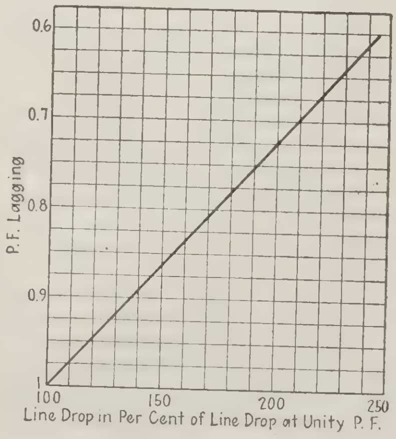

**Fig. 4—How Line Drop Increases**

This represents the effect of low power factors on the same line as illustrated in Fig. 3. The kilowatt load is constant over a 1,000-ft., three-phase, 60-cycle circuit of No. 0 wire. The power is 440 volts at the motor

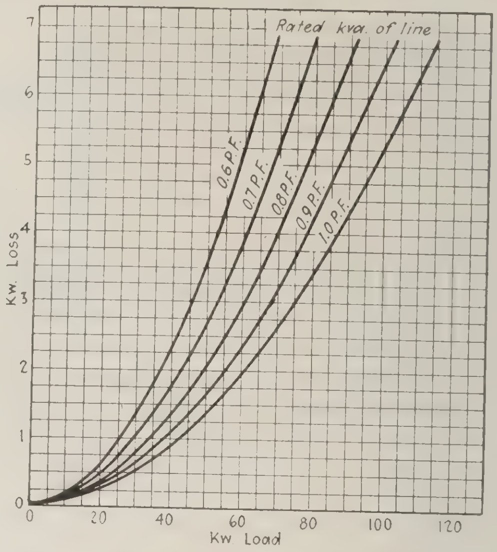

**Fig. 5—Loss of Voltage on 440-Volt Line**

In one case the installation of a 500-kva., synchronous, condenser outfit and a 300-kva., synchronous condenser has permitted the addition of a 500-hp. load without any other changes in equipment. If this had not been done a new turbine generator, an additional line, and two banks of transformers would have been required, costing several times as much as the synchronous condensers.

In another case, the necessity for the installation of a turbine generator, additional lines and transformers was obviated by the use of a low leading power-factor, synchronous motor-generator set connected to the load side of the transformers at the point where the additional load was required.

In another instance, the installation of a 300-kva. unit of static condensers saved the investment of a new engine-driven generator unit which would have cost four times as much as the static condensers.

Each case carried additional advantages in decreasing the losses or increasing the economy of the plant. Naturally, where conditions have not become critical, the immediate showing will not be as great as in the cases mentioned, but the ultimate beneficial results may be just as attractive.

Improving the power factor might mean the avoidance of installing additional generators, transformers or lines. It might mean a considerable saving in power bills due to better rates and, in addition, a saving in losses, in transformers, lines and motors sufficient to warrant investment of power factor improvement devices. It might mean an improvement of voltage conditions which would increase production as a result of maintaining rated speeds of induction motors. Good voltage regulation might further mean a large saving in maintenance, as low voltage usually results in overheating of motors, transformers and cables.

# Mr. Lewis Seeks a Wider Audience

JOHN L. LEWIS, by virtue of his mastery of the United Mine Workers, is in the position where anything he may care to say respecting the coal problem will command attention—if not respect. Even the repetition of trite truths must be listened to with a humble show of eager interest when they roll from his lips. Such are the rewards of power. Therefore, when he claims consideration as a full-fledged author (*The Miners' Fight for American Standards;* Bell Publishing Co., Indianapolis, Ind., 189 pp., $2), he is assured in advance of a dutiful circle of readers whose size many a veteran writer might well envy.

Mr. Lewis presents twin theses, wrapped in a verbal orgy of flag-waving that threatens the supremacy of Mr. Cohan as the unexampled exponent of 110 per cent Americanism. His first thesis is that all the improvements which have taken place in mining methods and living standards in mining communities are the fruits of the activities of organized labor. The necessary corollary, developed with an effective restraint of heat, is that the non-union operations are the source of all the un-American tendencies which would drag industry back to serfdom. The second major thesis is that the operators as a whole—and here Mr. Lewis' pen is a spear that knows no brother, smiting alike union and non-union producers—have failed to take any constructive steps to put bituminous mining on a more solid foundation and that, therefore, it has devolved upon the miners' organization to save "capitalism" from its own follies.

These themes are developed through a dozen chapters in which the author discourses on "The American Spirit and Coal," fundamental evils of the industry, wages, mismanagement, freight rates, labor relations, overhead, the check-off and living conditions, to the end that the reader may agree with the final conclusion that the salvation and the freedom of the industry can come only through complete recognition of the union. The paradox escapes Mr. Lewis entirely. Admitting at the outset that "the coal industry was not conceived, planned and blue-printed by scientific supermen or young critics just out of Harvard," Mr. Lewis sees in its somewhat haphazard growth and the many mistakes of inexperience, no support for the theory that government control would better conditions.

Mr. Lewis frankly confesses that the union "has no patent cure-all in its pantry" for the ills of the industry, but he is confident that the basic evil of overdevelopment is now on the way to elimination. Improved railroad service has made it impossible to boost prices on a car shortage scare; the long-term agreement in the union fields forestalls strikes "and leaves no hope to the non-union operator of profiteering at the expense of the union fields during suspensions." Mr. Lewis, in effect, charges the non-union districts with a conspiracy to bankrupt the union mines, but gleefully asserts that the non-union producers "are gradually bankrupting themselves in the vain effort to overcome geography by selling enslaved man-power in competition with coal. At the same time the struggle in the union fields is slowly weeding out uneconomic mines, obsolete equipment and incompetent management." An untrammeled functioning of the law of supply and demand "is working a cure."

To yield now to demands for a revision in wages, he argues, "would serve only to prolong the maladies of the industry, while sacrificing the rights of the miners." Mr. Lewis still clings resolutely to the claim that any reduction in union rates would be met by further reductions in non-union wages, although in the same chapter he states that the non-union fields have already "cut wages and coal prices to the bone." The undisputed fact that the present wage policy of the union is encouraging non-union production is passed over in silence.

Hit-and-miss methods of operation, according to Mr. Lewis, have been the rule in mine management. "The inefficiency and incompetence of superintendents and mine bosses as regards the correlation of mine operation is a plague on the industry," he declares, and calls upon the United States Coal Commission—heretofore roundly damned by the union—to prove his statements. Operators have neglected the opportunities to mechanize their mines, they have been backward in improvements and now that the lean days are upon them, says Mr. Lewis, they cannot cut wages "to pay the costs of your business stupidity."

### SIDESTEPS LOCAL STRIKES

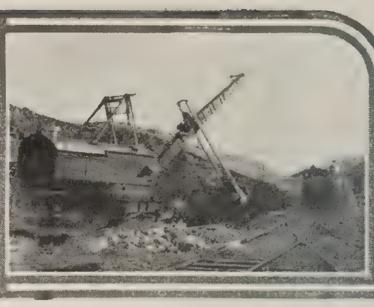
The author repeats his boast that the international union has never violated a contract. In the next breath, however, he acknowledges that local strikes are many and sees no way to end them under existing conditions. "These local struggles," he pleads in defense, "really originated twenty million years ago in the geological causes which have determined the working problem of various coal fields, coal seams and individual mines, different from the similar problem presented anywhere else." Apparently conscious that this defense may not be convincing, he shifts the responsibility to mine managements and in so doing tries to lift local strikes out of the category of contract violations.

Mr. Lewis enters a vigorous denial to the charge that the union has opposed mechanization. He insists, however, that "mine labor demands and will enforce the right to such consultation in the period of mechanization as will prevent the sacrifice of its standards in the process." He suggests, with enough truth in some cases to give sting to his words, that one thing which is burdening coal production is an unwise multiplication of sales efforts. Many consolidations, he declares, have been rendered ineffective because of excessive property valuations and because they were top-heavy with ornamental executives.

The book is marred, not only by certain hyperbolic excesses of style, but also by senseless misstatements of facts. Mr. Lewis is most interesting when he is calmly expository, least convincing when he adopts Ellis Searles' swashbuckling style of verbal assault. The volume, of course, is undisguised propaganda. We doubt whether its author would claim otherwise. Mr. Lewis, with his knowledge of labor policies and his ability to put them into pungent English, is in a position to write a non-argumentative, though partisan, exposition of the philosophy of the United Mine Workers which would be a permanent and a valuable contribution to economic literature. *The Miners' Fight for American Standards* never comes within striking distance of that goal.

SYDNEY A. HALE.

# News Of the Industry



## Anthracite Miners' Wage Demands at Atlantic City May Reach 30 per Cent; Operators Ready to Oppose Strike

Joint conferences in what promise to be the most momentous wage negotiations in the history of the anthracite industry since the famous strike of 1902 will open at Atlantic City, N. J., this afternoon, July 9. Representatives of the operators and the United Mine Workers will take up the 15 demands framed at the tri-district convention of the miners held at Scranton, Pa., last week. These demands include planks for general increases in pay to both day and tonnage men, a five-day week and several other proposals which would add materially to the labor cost of production. Payroll checks now being made may show the wage increases would total as high as 30 per cent.

The operators met in preliminary conference at the offices of S. D. Warriner in Philadelphia, Pa., Tuesday afternoon and moved on to the Hotel Traymore in Atlantic City yesterday to map out their lines of battle in the contest with the union. It goes without saying that the producers will fight vigorously any proposal to institute the check-off in the anthracite region. There is, too, a strong sentiment in favor of a reduction in wages to lessen the competitive pressure upon anthracite sales. John L. Lewis, international president of the union, however, has declared unequivocally that the miners will not agree to any downward revision in pay.

### Lewis Gets Early Advantage

As in times past, Mr. Lewis and his associates have again seized the initial advantage by making a public confession and adoption of their demands. When stories that the miners would demand a 10 to 20 per cent increase first began to appear in the daily newspapers, about seven weeks ago, they were treated as toy balloons sent up by the union to test public sentiment. Up until the Scranton convention there were many observers who believed that the union would follow the same tactics it pursued at Jacksonville in 1924 and ask for a renewal of the existing agreement. There were some anthracite men who were resigned to that as inevitable. Those who took such a view felt that the rates now being paid were out of line, but saw no escape from them because they feared political intervention would come before it would be possible to win a reduction.

The truculent character of the keynote address delivered by Mr. Lewis at Scranton and the demands embodied in the convention platform, however, have driven operators holding such views into the ranks of the group that believes a determined effort should be made to reduce production costs.

Though no official statement of the producers' position had been made at the time these lines were written, it is betraying no secret to state that the operators are a unit in their opposition to any increase in labor costs on hard coal. There was a time when some of them would have welcomed a short suspension—not to boost prices, but to bring supply more in line with demand. Such an interruption in mining would no longer be welcomed because the industry realizes that the purpose of a shutdown of three to six weeks would be grossly misinterpreted.

### See Disaster in Higher Wages

In the brief negotiations preceding the 1922 strike the operators endeavored unsuccessfully to persuade the union representatives to agree to continue operations pending a settlement of the issues before the joint conference and by unrestricted arbitration. There is reason to believe that the operators would be willing to repeat these offers in the interest of the public.

In spite of statements that anthracite production is curtailed by design and that demand exceeds supply, the operators have had growing sales resistance ever since the war and realize fully that tamely to submit now to wage increases that would raise the price of coal would invite disaster.

With the exception of the check-off demand, the scale committee's report to the Scranton convention suffered no opposition. George Horne, of Locustdale, supported by a dozen delegates, demanded that the check-off be excluded from the demands. His voice in the convention was drowned by the howling and booing of the majority of delegates present.

The presentation of the demands will be followed by a suspension of mining, according to Andrew Mattey, president of the Hazleton district, who in the closing hour of the tri-district convention in Scranton on last Thursday, told the delegates to prepare for a shutdown on Aug. 31. Said he: "When your agreement expires there will be no new agreement reached, and the mines will close because the operators have 10,000,000 tons of coal in storage. When the mines are closed this will begin to move, but at higher prices. Instead of paying $18 for coal in some place the consumer will be paying $25. For this you will be blamed. The miners will get the blame; the operators will get the dough."

**Christ J. Golden**

President of District 9, United Mine Workers, and chairman of anthracite scale committee.

### Ask Two-Year Contract

The union demands are as follows:

"(1) We demand the next contract be for a period of two years, with complete recognition of the United Mine Workers of America, Districts 1, 7 and 9.

"(2) We demand that the contract wage scale shall be increased 10 per cent; all day men shall be granted an increase of $1 per day; that the contract laborers' increase now being paid by the operators shall be added to the contract rates; and that the differential in cents per day between classifications of labor previous to the award of the United States Anthracite Coal Commission shall be restored.

"(3) We demand uniformity and equalization of all day rates and that the consideration rate of each colliery shall be equivalent to the average daily earnings of contract miners under normal conditions and that for dead work performed by the contract miner he shall be paid this consideration rate; and that skilled mechanics, such as carpenters, blacksmiths, &c., shall be paid the recognized standard rates existing in the region; and that engineers and pumpmen who do repair work on their engines and pumps shall be paid the recognized mechanic's rate for this repair work; that first-class hoisting engineers shall be paid a more substantial rate of wages in keeping with the responsibilities and nature of the work; and that all daymen shall be paid time and one-half for overtime and double time for Sundays and holidays.

"(4) We demand that where coal is paid for by the car it shall be charged and payment shall be made on the ton basis of 2,240 lb., and where dockage and penalties are now imposed for refuse that the amount of refuse to be permitted in any car shall be fixed by the mine committee and colliery officials in conformity with the agreement, and that the present unreasonable penalties and dockage shall be abolished.

"(5) We demand payment for all sheet iron props, timber, forepoling, extra and abnormal shoveling where such is not now paid for; and that the same full rates shall be paid for skipping as for splitting pillars, both advancing and retreating; advanced openings driven for development purposes shall be paid for on the proper basis covering such work; that in thin veins, where the pitch is not sufficient to carry the coal on the bottom, the distance of the working places shall not exceed 150 ft., and that jackhammers and air necessary for their operation shall be supplied to miners free of charge, and that company workers shall be supplied with tools for use in their work free of charge; and that electric lamps and batteries where used shall be supplied free of charge.

"(6) We demand that a uniform rate of twenty (20) cents per inch be paid for refuse in all kinds of mining up to ten (10) ft., wide, and that the rate for blasting top and bottom rock shall not be less than thirty (30) cents per inch, with the understanding that these rates are to be the minimum, not affecting higher rates that exist.

"(7) On the general improvement of conditions, looking toward greater efficiency in operation, and as an evidence of simple justice to those affected, we demand that the account of all cars loaded by the miner shall be credited at the working place; that maintenance men shall be continued at their regular necessary continuous occupations, and not replaced by others during broken time; that a five-day work week be established, which would permit of the working of the usual average number of days per year and provide for greater efficiency in operation and the elimination of the haphazard system of enforced idleness on different days, as is now the practice; that contract miners shall be provided with work at the consideration rate when, through no fault of their own, they are not permitted to work at the face of their regular working place; that all drivers should receive consideration for handling mules before and after quitting time; that in the laying off of men the older men in point of service shall have seniority rights, and likewise the older men in point of service who shall be out of employment shall be returned to such occupations available in conformity with the principle of seniority; that in the adjustment of grievances every possible improvement in the present system shall be made so as to provide for a more prompt and satisfactory determination of such grievances under the contract; that a more comprehensive method be outlined to protect the miners in having them placed on consideration work when, through abnormal conditions, they are unable to make wages, that employees of rock and stripping contractors be brought under the terms of the general agreement, with the same privileges and rights of all other employees; that all employees of diamond drill contractors be brought under the agreement and that their rates shall be uniform and standardized as on a basis in keeping with the skill and knowledge required in the work."

Supplementary recommendations attached to the demands were:

"(1) Repairs, rebuilding and erection of new buildings are necessary to relieve the housing situation in many sections of the anthracite region, and we therefore recommend that our scale committee use every effort to have the general housing and sanitary condition of the coal companies' properties improved upon as much as possible.

"(2) A number of coal companies which operate one or more collieries at times when market conditions are dull, shut down some collieries completely and keep others in operation. We consider this most unfair and recommend that our scale committee use every effort to bring about an equal division of work at all collieries under any given company."

## Harry C. Adams Dies

Harry C. Adams, 67, coal operator of Chicago, died at his home 420 East 50th St., June 27, after several months of declining health. He was president of the Peerless Coal Co., owning the Peerless mine at Springfield, Ill., and president of the Springfield Terminal Railroad Co., which runs a small connecting line serving several mines in the Springfield district. Mr. Adams also was head of the Central Illinois Coal Operators Association and for years was a spokesman for his district in labor negotiations.

Harry C. Adams

Mr. Adams rose from railroad ranks, having made his start in the Columbus (Ohio) freight office of the Big Four. He became secretary to the general manager of the Ohio Central Coal Co., which later expanded as the Sunday Creek Coal Co. After another period in railroading he was made Chicago agent for the Turney & Jones Coal Co. In 1900 he and John S. Jones formed the Jones & Adams Coal Co. In 1915 he became president when Mr. Jones went to Columbus to be head of the Sunday Creek Coal Co. Jones & Adams eventually dissolved and Mr. Adams was made president of the Peerless Coal Co., in which the late Francis S. Peabody was interested. The Peabody Coal Co. has functioned for several years as operating engineers for Mr. Adams' company.

## M. K. & T. to Open New Kansas Coal Field

The opening of an important new bituminous coal field in Kansas was presaged in the announcement on June 30 of the discovery of a 5-ft. vein of coal in Labette County. The new field, while in the southeastern part of the state, lies some distance west of the present southeastern Kansas field. In places the new vein is said to attain a thickness of 6 ft. The Cherokee and Crawford County veins, to which southeastern Kansas operation heretofore has been confined, run from 20 to 40 in. thick.

The Pittsburg & Midway Coal Co., Charles F. Spencer, of Pittsburg, president, announced the discovery after it had taken options on the mineral rights of 5,600 acres of land in the new field for the Missouri, Kansas & Texas R.R. Farmers were paid $35 an acre for the mineral options, but it is understood that the railroad interests were ready to pay $75 more an acre for surface rights, where needed. The vein lies at a depth of from 600 to 800 ft.

The opening of the new field will be a fulfillment of the desire of the railroad to establish a coal supply on its own lines. Many oil-burning roads of the southwest in recent months have been considering the advisability of going back to coal in the interest of economy. The Missouri, Kansas & Texas was one of the first to take action when, a few weeks ago, it reconverted twenty of its locomotives out of the Parsons (Kan.) shops to coal.

## J. K. Dering Passes Away

J. K. Dering of Chicago, head of the J. K. Dering Coal Co., died at 6 o'clock in the morning of July 6 after a brief acute illness. Mr. Dering, whose company now operates mines in Indiana and southern Illinois, had been a leading figure in the coal industry of the Middle West for a generation. He was markedly successful financially and of late years had been able to escape from the grind of business for many lengthy sojourns on his plantation in Mexico. The principal responsibilities of his coal operations recently have rested on James B. Pauley but Mr. Dering always was in close touch with coal affairs and his opinions were much sought after. His brother, Charles L. Dering, who survives him, conducts a coal jobbing business in Chicago.

## High Anthracite Prices Due to Trade Monopoly Says Trade Board Report

Monopolies in the anthracite fields and the pyramiding of prices by independents, wholesale and retail dealers are largely responsible for premium prices to consumers, according to a report to Congress by the Federal Trade Commission made public July 6.

"In order that the present generation may have an adequate supply of anthracite at a reasonable price, more effective competition must be established," the commission said. "Complete restoration of competition is not only practicable in the anthracite industry in the opinion of this commission, but, also, is preferable to price regulation, which has often been advocated with respect to this industry."

The commission feels that more information as to the actual conditions in the coal industry should be obtained and placed before the public. The suggestion is made that Congress set up a federal agency to obtain and publish currently "data on production, prices, costs and profits in the coal industry."

The report says the lack of current information in the frequently recurring emergencies in the coal trade is "the greatest obstacle to intelligent action on the part of the public and the government," and adds that "the premium prices of 1923 were the result of an anticipated shortage and a panic demand due largely to general ignorance of the real conditions."

According to the commission, the investigation just completed has revealed that the independents ran their prices above those of the eight big companies when there was fear of a shortage, or an actual shortage, and that the wholesalers also jumped their prices to the retailers and the retailers to the consumers.

The principal points developed by the investigation are as follows:

"A long period of monopolistic combination in the anthracite industry (now largely abated by recent judicial decrees) has resulted in concentration in the ownership of coal lands; in the failure to increase mining capacity adequately, so that production has not developed with demand; in the establishment of an unduly high general price level, and, in times of temporary or apparent shortage, in high premium prices at the mine which have encouraged and facilitated the taking of excessive profits both by wholesalers and retailers.

### Blames High Premium Prices

"The existence of high premium prices at the mine has also led to speculative sales among wholesalers, thereby further enhancing the price paid by the retailer. During August and September, 1923, from one-third to more than two-fifths of the reported sales of premium anthracite was handled by two or more wholesalers before being sold to a retailer."

The report has attracted interest in some quarters because of the threat by John L. Lewis, president of the United Mine Workers, of calling out the bituminous coal miners if the operators continue alleged violations of the Jacksonville agreement. A suspension in the anthracite fields also is not unlikely in view of the miners' demand for a 10 per cent increase in wages, which the operators are expected to meet with a counter demand of a reduction.

**John L. Lewis**
President of the United Mine Workers

## Sargent to Ask Rehearing in Trade Association Cases

In announcing his intention to file petitions for rehearings in the Maple Flooring and Cement Manufacturers' Protective Association cases, the Attorney General made it clear that he is in no way challenging the principles laid down by the Supreme Court, but simply is attempting to show that there was violation of law in these particular instances. The Attorney General's statement follows:

"Petitions for rehearing in these cases are in course of preparation and will be presented to the Solicitor General within a few days. Leave was granted by the Supreme Court on June 8 to file such petitions within 30 days.

"The object of the petitions will not be to obtain a reconsideration of the principles of law enunciated by the Supreme Court in its recent decisions but to point out that the evidence in these cases brings them within prior decisions of the Supreme Court, the authority of which has not been questioned. In other words, the government will not take the position that the Supreme Court erred in holding that the mere collection and dissemination of trade statistics is in itself unlawful but will endeavor to point out that the evidence in the records shows that both the Maple Flooring Association and the Cement Association were co-operating in the use of such information for the purpose of maintaining prices.

"The whole effort will be to show that the evidence leads irresistibly to the conclusion that the defendants, through their associations, had agreed to maintain prices and otherwise restrain trade within the prior decisions of the Supreme Court in the Hardwood Lumber and Linseed Oil cases."

## Two Coal Mergers in Ohio Nearly Completed

Consolidation of coal companies operating in the eastern Ohio No. 8 district is expected to be announced within a few days. Operating and financial interests have been working over the details for more than six months and nearly all the difficulties are believed to have been overcome.

It is understood that at least two mergers are being considered, but that one of them far overshadows the other in tonnage involved. When both are completed practically the entire No. 8 field will be controlled by two corporations.

The larger of the two consolidations is expected to consist of the Youghiogheny & Ohio Coal Co., Lorain Coal & Dock Co., Clarkson Coal Mining Co., Pittsburgh & Ohio Mining Co., Maher Collieries Co., Central Coal Co., United States Coal Co. and two or three smaller concerns. The smaller consolidation is expected to center around the Wheeling & Lake Erie Coal Co., the Hanna property.

A few companies are understood to be considering joining the larger consolidation after the first alignment is completed, with the result that the company may grow by accretion for some time after the new corporation is formed.

The amount and nature of new financing which may be undertaken is not yet known to the coal trade.

S. H. Robbins, president of the Youghiogheny & Ohio company and chairman of the board of the Midland Bank of Cleveland, is to be chairman of the new company. R. L. Wildermuth, of Columbus, vice-president and general manager of the Lorain Coal & Dock Co., is to be vice-president in charge of operations, and H. L. Findley, vice-president of the Youghiogheny & Ohio company, is to be vice-president in charge of sales. If a president has been selected his name has not become public. Headquarters will be in Cleveland.

## Less Coal Consumed by Industries in May

Industry used 3,158,000 tons less coal in May than in April, according to a report by the National Association of Purchasing Agents. The total is estimated at 29,548,000 tons, not including coal used for heating buildings, which is approximately 2,000,000 tons less than was used in the same month last year and about eleven million tons less than was used in May, 1923. Economies effected in the burning of coal during the last two years enable concerns to use less fuel for manufacturing the same amount of material.

Coal stocks on hand in industry at present are the smallest since the association has been compiling figures, a total of 39,317,000 net tons being estimated on hand June 1. This is sufficient for 40 days' supply in industry based on the amount consumed in May. Of the firms reporting, 18 per cent used more coal than in April, 53 per cent the same amount and 29 per cent less.

# Congress May Intervene if Strike Is Protracted; Hard-Coal Operators Ready for Finish Fight on Check-off

**By Paul Wooton**

Washington Correspondent of *Coal Age*

While John L. Lewis' threat of a bituminous-coal strike took Washington by surprise, there is no thought that he will carry it out. There is increasing conviction, however, that a suspension in the anthracite region is most likely. Competition from oil and other fuels makes the anthracite operators doubly anxious to take advantage of what seems to them the most favorable opportunity in many years to reduce their labor costs.

They had hoped that the bad situation in the Central Competitive Field would result in some agreement which would pave the way for a reduction in the anthracite region also, but apparently the possibility of trouble in the anthracite fields has been the one thing that has prevented such an understanding.

Just how an anthracite strike will result in an increased demand for coal from the Central Competitive Field is not thoroughly understood here. The Northwest will have most of its coal before the present agreement expires. The use of anthracite in the Middle West no longer is large and most of the requirements of that section already have been filled. The substitution will be confined to New England and the North Atlantic seaboard states. Substitution there more naturally would be with non-union coal. One of the reasons why the authracite producers are so insistent upon a wage reduction is the very active efforts being made to sell smokeless coal in that region.

### Will Fight for Check-Off

Information reaching Washington is to the effect that the effort to obtain the check-off in the anthracite districts will be more determined than on any previous occasion. For the ordinary purposes of the union the button does very well, but now the great need is for special assessments.

The campaign to organize the non-union districts requires large amounts of money. Enough cannot be raised for that purpose from the bituminous miners when so many of them are out of employment. Every two-dollar assessment in the anthracite districts will raise more than $300,000.

Even with the competition that they are facing and the difficulty of passing on increased costs, it is conceivable that enough pressure cou'd be brought to cause the anthracite operators to yield on a question of wage, but those familiar with sentiment among them declare that no amount of pressure will induce them to accept the check-off. They are even more determined now than ever before not to place in the hands of the mine worker this weapon which could be turned with such effect upon them and upon the bituminous operators, with whom, after all, there is a close community of interest.

While there is reason to believe that the union is preparing to make a determined fight for the check-off, it is at a disadvantage in that it might alienate the sympathy of the railroad unions. Reliance is being placed on them to cripple the distribution of non-union coal. They probably would not cooperate very heartily or effectively were the check-off the issue. Railroad workers do not conceal their contempt for this evidence of lack of loyalty and they do not hold in high regard a union which must resort to such a method to collect its dues.

As is the rule in these clashes in the coal industry, no opportunity will be given the participants to fight out their differences without political interference. Mr. Lewis, as in the past, will find a way to bring about intervention by some authority, state or federal. In view of the disastrous consequences to the operators of such intervention in the past, it may be that in this instance they will insist on being let alone.

If differences have not been adjusted before Congress convenes in December that body is certain to take a hand, even if administrative officials have not intervened before that time.

The one thing that may influence the anthracite operators to consent to government arbitration, or to accept a compromise that will be satisfactory to the union, will be the fear of federal regulation. It may become a question of deciding between the lesser of two evils. The bituminous operators have more fear of regulation that have the operators in the anthracite field. If regulation is threatened, the bituminous operators are likely to join forces with those who would favor nearly any compromise before precipitating a fight in Congress on regulation. The sentiment among the anthracite operators, however, is said to be for a finish fight on the check-off at least. They are said to feel that the question of regulating the coal industry must come up sooner or later and that the chances of beating it are likely to be as good in the next Congress as at any time in the future.

---

## Allow 20 per Cent Wage Cut In Northern Colorado

Reduction of the wages of coal miners to what is known as the 1919 scale was allowed nine coal mining companies in the northern Colorado field by the State Industrial Commission on June 26. The award constitutes a reduction of 20 per cent from present wages.

The award is a partial victory for the miners. The companies had asked permission for a reduction to the 1917 scale. That would have meant a reduction of approximately 30 per cent.

### *Green Urges Co-operation By Church and Labor*

The happiness of the American people can be "best promoted" through an understanding and cooperation between the religious forces of the nation and its organized labor groups, declared William Green, president of the American Federation of Labor, at Buffalo, N. Y., June 28.

Addressing the New York State Christian Endeavor Union, Mr. Green urged "co-operation on all subjects of common interest embodying the essence of morality, justice and fair dealing," and said that "regarding those subjects upon which we may not be in accord we can, at least, maintain a charitable and sympathetic attitude toward each other."

The Federation, he said, will continue its fight for compulsory education, for "if men and women are to exercise the power of self-government, above all they must understand our form of government, its institutions, its ideals and its structure."

The commission made its findings after extended hearings at several coal camps, at which representatives of the operators and miners took the witness stand. The reduction was opposed by the miners. Just what the men will do now is not known to the members of the commission.

The companies affected are the William E. Russell Coal Co., the Consolidated Coal & Coke Co., the Boulder Valley Coal Co., the National Fuel Co., the Grand Junction Mining & Fuel Co., the Big Four Coal & Coke Co., the Crown Fuel Co., S. Domenico & Sons and the Clayton Coal Co.

---

## Crowe Mine Squabble Goes To International Union

The controversy between representatives of union miners and the J. R. Crowe Coal Co. over the operation of the two Crowe mines at Henryetta, Okla., on an open-shop basis will be referred by the union representatives in the Southwestern district to the international union headquarters. A conference at Kansas City, Mo., last week between officials of the Crowe company and the union did not result in an agreement. The mines are now operating part time on the open-shop plan. Union men are picketing the properties.

These union officials were at the conference: William Dalrymple, president of the Oklahoma district, No. 21; Daniel O'Connell, vice-president of the Kansas district, No. 14; Harry W. Burr, secretary-treasurer of the Kansas district; James Fitzgibbons, Kansas district; James Bell, district board member of Oklahoma; John S. Cochran and D. A. Frampton, international union representatives. Mr. Crowe and H. D. Buchanan, vice-president of the Crowe company, represented the coal company.

## Watson Tells Lewis Union Agreement "Collapsed" and Thus Was Not "Abrogated"

The agreement between miners and operators in West Virginia and elsewhere "collapsed" and therefore the Consolidation Coal Co. did not "abrogate" it. This was the answer C. W. Watson, chairman of the board of the Consolidation, made to John L. Lewis, president of the United Mine Workers, in reply to the latter's charge of contract breaking. Mr. Lewis made the charge against Mr. Watson's company, the Pittsburgh Coal Co. and the Bethlehem Mines Corporation during a speech at the anthracite miners' convention in Scranton, Pa., June 30. Mr. Lewis threatened a nation-wide soft-coal strike "to enforce the Jacksonville agreement," but he has made no public move since then to bring about a strike. However, correspondence between Mr. Lewis and Mr. Watson dealing with the "abrogation of contract" and setting forth both sides of the case has been made public within the week.

In the Lewis-Watson correspondence Mr. Lewis first wired Mr. Watson asking if it was true the Consolidation Coal Co. was going to abrogate the contract June 1. Mr. Watson replied that the Fairmont mines of the company had been shut down because further operation had become impossible in the face of large losses due to the existing wage contract. He said 1,100 employees had left the Consolidation, many to work for competitors at wages below the union scale, and that many others, who had been employed on part time, had asked the company for work under conditions offered at non-union mines.

Mr. Lewis sent back a telegram reminding Mr. Watson that the Consolidation had signed the wage agreement, which still had 22 months to run, and that he could see no reason why the Consolidation should break the contract because other companies had done so.

### Suggests Inspection Tour

In answer, Mr. Watson said that Mr. Lewis was unfamiliar with conditions in the West Virginia field and suggested that they make a tour of inspection together.

Mr. Lewis countered that he did not question Mr. Watson's statements that much coal was being produced in West Virginia under non-union conditions at reduced wages, but declared that this was due to the action of large numbers of operators in the fields in repudiating the wage contract. He recalled the signing of the agreement by the Consolidation and said that he expected the company to abide by it.

Mr. Watson wired back that he was mailing a memorandum covering conditions in the West Virginia fields. In this he set forth that it had been proved that the wage agreement no longer existed as a working reality because of repudiation by both sides. Production was being carried on almost wholly under non-union conditions, he declared.

The memorandum of conditions in the field follows:

### *Alberta Miners Quit U. M. W.*

About 800 coal miners in the Drumheller field, Alberta, have withdrawn from the United Mine Workers and formed their own local union. Nearly 500 of the men are on strike against an agreement signed by the big union officials with the operators.

The original strike, declared June 30, resulted from failure to reach an agreement on a proposal by the operators that the wage scale be reduced about $1 a day. Six mines are affected. Only minor disturbances have occurred in the district.

"The collapse of the so-called 'Baltimore Agreement', entered into between the Northern West Virginia Coal Operators' Association and the sub-district organizations of District No. 17 of the United Mine Workers, may be briefly summarized as follows:

"(1) At the time of the negotiations it was informally agreed between representatives of the two parties that at least 20 per cent of the production in the region was being produced under non-union conditions. Subsequent investigation showed that this was, if anything, an underestimate. It was also agreed that this situation offered a distinct menace to the stability of the union agreement, and that its spread, to any appreciable extent, could only destroy it.

"(2) During subsequent months, regular and careful surveys of the situation revealed the following steady growth of non-union production, and an equally steady decline of tonnage produced under the Baltimore agreement:

NORTHERN WEST VIRGINIA FIELD—AVERAGE DAILY CAR LOADINGS

Union and Non-Union Mines

| | Cars | | | Per Cent | |
|---|---|---|---|---|---|
| 1924 | Union | Non-Union | Total | Union | Non-Union |
| June... | 736 | 438 | 1,174 | 62.7 | 37.3 |
| July... | 636 | 444 | 1,080 | 58.8 | 41.2 |
| Aug.... | 673 | 508 | 1,181 | 57.1 | 42.9 |
| Sept.... | 776 | 605 | 1,381 | 56.3 | 43.7 |
| Oct.... | 832 | 727 | 1,559 | 53.4 | 46.6 |
| Nov... | 885 | 792 | 1,677 | 52.7 | 47.3 |
| Dec.... | 743 | 759 | 1,502 | 49.5 | 50.5 |
| 1925 | | | | | |
| Jan.... | 747 | 938 | 1,685 | 44.3 | 55.7 |
| Feb.... | 593 | 961 | 1,554 | 38.1 | 61.9 |
| Mar.*.. | 601 | 939 | 1,540 | 39.0 | 61.0 |

*Percentages for the last week in March were: Union, 33.4, Non-Union, 66.6.

"(3) When the sales contracts secured prior to the Baltimore Agreement expired with the beginning of the new coal year, April 1, 1925, practically every union operation of any size, with one exception, suspended. The exception was the Consolidation Coal Co., which, with a greatly reduced number of mines, continued its efforts to operate for another month or more. This company then likewise came to a practically complete shutdown, forced by heavy losses and by its practical isolation in the matter of labor costs.

"(4) In recent weeks almost the entire output of the region, totalling nearly 1,200 cars daily, has been produced by operators and mine employees working together under non-union conditions of wages and employment. From whatever motive or cause, the essential fact is now the almost complete repudiation of the Baltimore wage contract by both sides. As a working reality it no longer exists.

"(5) During these months the affairs of District No. 17 of the United Mine Workers had been put into a state equivalent to a receivership. The duly elected district officials were supplanted by personal representatives of the president of the national organization, and local autonomy and control were suspended. Thousands of the union members openly withdrew from the wage contract as individuals by seeking employment wherever it could be obtained under the terms available. Briefly, the situation now consists of outside officials, neither chosen by nor accountable to the rank and file of the district membership, and who supervise a body that is only a fraction of the original organization in this field. In other words, so far as their individual economic action is concerned, the union contract relationship has been specifically repudiated by an overwhelming majority of the union members. As for the officials, there are none who can speak for the district but only for the national body.

"(6) The alternatives now facing both the union operator and the union employee are, therefore, not the choice between both working under the contract and either breaking it. The contract, being in its essence a collective agreement, is already broken and gone. Neither side has been able to cope with the forces which brought this about. The present alternatives, and the only ones, are those between sharing idle mines and unemployment on the one hand, and sharing competitive production and prevailing wages on the other.

"(7) Essentially this is a choice which now rests solely upon the individual employee, just as it has already been decided by thousands of them. If an employee of a company, both hitherto bound by the union contract, prefers to endure months of unemployment throughout the remaining term of the contract, in order to maintain his union membership, that is his privilege. If, on the contrary, he prefers not to assess this penalty upon himself and his family as the price of his union affiliation, but decides rather to exchange a printed scale for actual earnings, that also is his right. The company can neither compel the one nor deny the other.

"(8) Under such conditions the issue to be decided is not the technicalities of a document which exists only in the files of the operator and employee but their mutual decision on the obligations which they owe to the families and to the properties entrusted to their care. These obligations existed prior to and independent of the relationship to the third party of the union."

---

The Northwestern Coal Dock Operators' Association on June 24 sent to the Federal Trade Commission a report of compliance with the cease and desist order of the commission, which was amended to conform to the decisions of the Supreme Court in the Maple Flooring and Cement cases, in reference to distribution of trade information.

# Strikers' Cause Now Seems Hopeless In Northern West Virginia Field; Union Seeks to Involve Government

Threats made by International President John L. Lewis of the United Mine Workers and other international officers are not taken very seriously by West Virginia coal operators. Instead of fearing harm to non-union production in northern West Virginia, they look upon Lewis' utterances as a prospective business stimulator. Some labor leaders think Lewis' next move will be to involve governmental authorities.

If present non-union coal-production figures can be taken as a criterion, and no doubt they can be, the northern West Virginia coal fields are lost to the union. Nothing short of an anthracite strike or some powerful stimulus to the bituminous coal industry can help the United Mine Workers here and it is even a grave question whether that would aid their cause very much.

Eighty-six per cent of the coal production was non-union during the first three days of last week; the open-shop mines produced 3,772 cars of coal compared to 594 cars loaded by union mines. In the first half of the week there were 154 non-union mines at work daily on the average, while 10 union mines worked.

### Many Operations Resume

The West Fairmont Shaft, which is located within the limits of the City of Fairmont, was opened by the Consolidation Coal Co. July 2, when 28 men started to clean up the plant preparatory to running coal. The Hutchinson Coal Co. has resumed operation at Robey mine, in the Clarksburg section of the field. Highland mine of the Consolidation Coal Co. is expected to open within a short time. Perry mine No. 50, a coal station of the Consolidation Coal Co., is now fueling B. & O. engines, it being located near Clarksburg.

A new daily production record of 1,580 net tons was made June 25 at the Osage mine of the Brady-Warner Coal Corporation, in Scott's Run. This excels the mine's production even under union conditions, Major Samuel D. Brady announced.

Late last week Attorney John B. Wyatt announced that he was at work preparing an injunction restraining the United Mine Workers from molesting the miners employed at Owings mine of the Consolidation Coal Co. Mr. Wyatt says he represents the new miners' union and not the company in the proceeding.

The union miners say that the company is taking this position because the Wyatt miners have been picketing Owings mine, which the concern is working on a non-union basis.

Everything is quiet in the Panhandle Coal fields of northern West Virginia. In Elkins, June 29, Federal Judge W. E. Baker filed a memorandum denying, because of lack of jurisdiction, the application of the Mineral State Coal Co. and 18 other companies for a preliminary injunction against John L. Lewis, president of the United Mine Workers; certain district officials and others. A temporary restraining order in this case was granted June 2, which has been continued in force, pending Judge Baker's decision.

Another effort is being made by the United Mine Workers to draw the government into the strike situation in northern West Virginia. Van A. Bittner, chief representative of the miners' union, sent a telegram to Secretary of Labor James J. Davis in Washington, D. C., July 1, scoring coal companies in the Fairmont field for alleged abrogation of their contract. The telegram reads:

"The Consolidation and Hutchinson Coal companies are the latest operators in northern West Virginia to abrogate their agreements with the United Mine Workers. It is my opinion that the miners will defeat these contract abrogators on the industrial field, but we think it is a disgrace and shame that the action of these companies necessitates our people going through all the hardships of an industrial war to force coal operators to comply with their wage agreements. We think the time has come when the government of our country shall say to these coal operators: 'you must comply with the agreement you made with the United Mine Workers of America.' The United Mine Workers does not propose to be driven back to the 1917 wage scale by this method of guerilla warfare, and unless these coal companies are forced to comply with their wage agreements we are fast approaching the place when a general strike of all the bituminous miners of the country will be inaugurated to preserve our wage scale against the most dishonorable and shameful conspiracy among coal operators that has ever been formed in any country in the civilized world."

### Bittner Echoes Lewis

After saying that the strike situation in northern West Virginia is favorable, Mr. Bittner says that the recent address of International President John L. Lewis to the hard coal miners in which a general strike is threatened, "is certainly a definite statement of the position of the United Mine Workers."

The union continues its advertising campaign in newspapers in northern West Virginia and carries a page advertisement in which the "American plan" is attacked.

An attack was made last week by Mr. Bittner on Attorney John B. Wyatt, of Shinnston, counsel of the new miners' union in northern West Virginia, in which the status of its members is discussed. In a statement issued recently Mr. Wyatt said that the miners employed at the company contract plants cannot be classed as non-union, open-shop or "American plan" miners. To this Mr. Bittner says: "The United Mine Workers surely agrees with this statement. Regardless of what subterfuge these men attempt to hide behind, they are nothing more than common ordinary scabs, and the fact that any of them have attached their names to petitions, circulated by the coal company, proves they are registered for the rest of their lives as scabs."

**Philip Murray**

Vice-President of the United Mine Workers

Mr. Wyatt's reply was: "I can truthfully say that the miners now working in the Consolidation Coal Co. mines feel that $4.60 a day is more than $7.25 a day under the old scale, because under the Baltimore agreement there was nothing, while under this plan the men are working and getting paid regularly."

Recently the Rachel mine of the Bertha-Consumers Co., at Downs, near Fairmont, resumed operations on a non-union basis. Miners' officials say that John Jones, president of the company, informed them he will not countenance an abrogation of contract. "The mine will remain closed until the company can sell coal at a price where it can pay the scale," the statement said. Despite this statement 42 men were at work at Rachel mine during the middle of the week. E. Frank Miller, general superintendent of the mine, declared that the mine will continue to work on an open-shop basis. He added that the men, all Americans, represent the majority of those employed when the mine last closed down. The mine is paying the same wage scale as the neighboring non-union mines.

Several hundred pickets gathered on the first morning the mine worked, but the number dwindled each day afterward. In a second statement Mr. Bittner says that Mr. Jones notified the miners' officials in the presence of Mr. Miller that he would not abrogate the contract. Mr. Bittner and William Turnblazer, president of District No. 19, were so notified, the miners say.

The miners' union reports that the J. H. Weaver & Co. interests at Rosemont have posted notices that the wages of the daymen were to be reduced from $4.52, and a 12 per cent cut made in tonnage and yardage rates, which, it is stated, is below the 1917 scale. Reductions will be made at the Wendel mine of the Maryland Coal Co. after July 15, to meet other non-union competition, the miners' union says in a statement.

# Consumers' Stocks of Soft Coal Fell to 38,000,000 Tons June 1; Hard-Coal Reserves for 52 Days

An inventory of the stocks of bituminous coal in the hands of consumers conducted by the Geological Survey reveals that the total quantity in storage on June 1, 1925, was 38,000,000 net tons, against 44,000,000 tons on March 1, 1925, and 51,000,000 tons on June 1, 1924. The trend of stocks has been steadily downward since the early part of 1924 and the heavy reserves built up by consumers in late 1923 have been reduced to more normal proportions; in fact, the present supply is slightly less than that in the summer of 1921.

Measured in tons, there was a reduction in stocks of 19 per cent during the period Sept. 1, 1924, to June 1, 1925, of which 14 per cent occurred during the last three months. At the rate of consumption prevailing from March 1 to June 1, the stocks on June 1 would last 32 days if evenly divided, a decrease of 29 per cent compared with the 45 days' supply on hand Sept. 1, 1924.

In addition to the quantity in the storage piles of consumers and dealers, it is estimated that the following quantities were in transit on June 1: On the commercial docks of Lakes Superior and Michigan, 3,800,000 tons; in storage at the mines or at intermediate points, 150,000 tons.

*Anthracite.*—Retail dealers in anthracite had a 52 days' supply of that fuel on June 1, an increase of 11 per cent over the supply on March 1 and slightly more than that on June 1, 1924. The movement of anthracite in the Lake trade began early this season and as a result the total on the upper Lake docks now stands close to 1,000,000 tons. This is more than double the quantity on the corresponding date a year ago.

The estimate of soft-coal stocks, which is based on reports from a selected list of about 5,000 consumers, does not take into account the coal in the bins of householders, steamship fuel, and the tonnage on Lake docks. The latter item is classed as coal in transit.

The liquidation of the near-record bituminous coal reserves of Jan. 1, 1924, has now gone on steadily for a year and a half, and the total stocks on June 1 were lower than any on record for a normal corresponding date. The reserves on that date were not quite twice those of June 1, 1920, when an acute shortage resulted in a panicky market with runaway prices.

The reports from consumers, supplemented by information from other sources, indicate that the rate of soft-coal consumption—including exports—from March 1 to May 31, 1925, was at the rate of approximately 1,250,000 tons a day, or 8,750,000 tons per 7-day week. During the preceding 6 months, Sept. 1, 1924, to March 1, 1925, the average daily rate of consumption was about 1,480,000 tons.

Fig. 2 gives a comparison of the days' supply of the seven principal classes of consumers on June 1, 1925, with those on the same date of 1924. The individual reserves of each group were appreciably less than they were a year ago, and the total days' supply was 35 per cent less than on June 1, 1924.

In studying the figures it should be borne in mind that they are averages and that the days' supply on June 1 is based on the spring rate of consumption, which normally is less than in the fall and winter.

Fig. 3 shows the geographical location of the days' supply at industrial plants, excluding steel and byproduct coke works. This is the largest single group of consumers, both numerically and from the viewpoint of consumption, and the one that illustrates best the general distribution of reserves. It is a sensitive business barometer, and changes in its activity are quickly reflected in the coal market.

On June 1, 1925, the industrials had an average of 32 days' supply, at the rate of consumption during the period March 1 to June 1, against a 40 days' supply on March 1, 1925, 53 days' supply on June 1, 1924, and 39 days' supply on June 1, 1923. The present stocks at such plants are sufficient for 8 days longer than those of June 1, 1920, when the actual tonnage held was at the lowest level on record and business was active.

Eighteen states had less than a 30 days' reserve, and 18 had stocks sufficient to last 30 days but less than 60. New England, with a 60 to 90 days' supply, had smaller stocks than usual at this season. Stocks in excess of a 90 days' supply were confined to the northern peninsula of Michigan.

The public utilities as a unit were in a stronger position than any other consumers, and on June 1, 1925, the electric power plants had a supply sufficient to last 48 days, and coal-gas plants had a 68-day reserve. Although well supplied, as compared with other classes of consumers, the reserves of the utilities are perceptibly lower than on other recent dates.

Practically complete returns from the manufacturers of byproduct coke and iron and steel indicated the following reserves on June 1, 1925, as compared with those a year ago:

**Byproduct Plants**

| | Days' Supply June 1 1924 | Days' Supply June 1 1925 |
|---|---|---|
| Low volatile | 41 | 14 |
| High volatile | 32 | 24 |
| Average | 34 | 20 |

**Steel Works**

| | Days' Supply June 1 1924 | Days' Supply June 1 1925 |
|---|---|---|
| Steam coal | 46 | 26 |
| Gas coal | 74 | 31 |
| Average | 56 | 27 |

The sharp decrease in the supply held by these two groups was due to a marked increase in activity as compared with the summer of 1924, and to a decrease in the actual tonnage on hand. The 20 days' supply at byproduct plants on June 1, 1925, was but 59 per cent of that of a year ago, and the steel

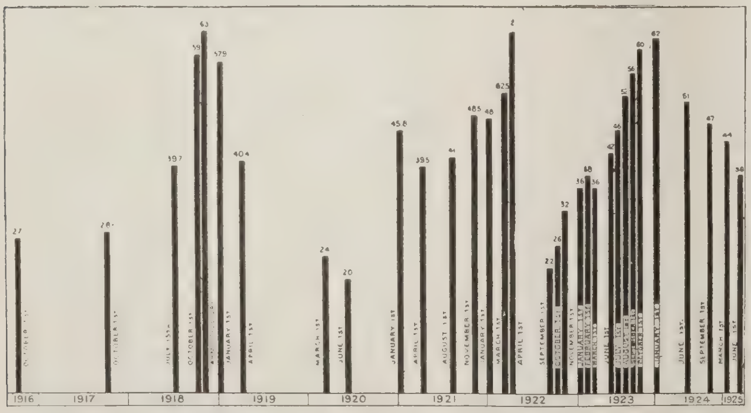


Fig. 1—Total Commercial Stocks of Bituminous Coal Oct. 1, 1916-June 1, 1925

Figures represent million net tons and include coal in the hands of railroads, industrial consumers, public utilities and retail dealers. Coal for steamship fuel, on Lake docks, in transit, and in the bins of householders is not included. The heavy stocks that were accumulated in 1923 have been reduced by nearly half. The present reserves are less than any recorded during the last seven years, except during the acute shortage of 1920 and the period following the miners' strike of 1922.

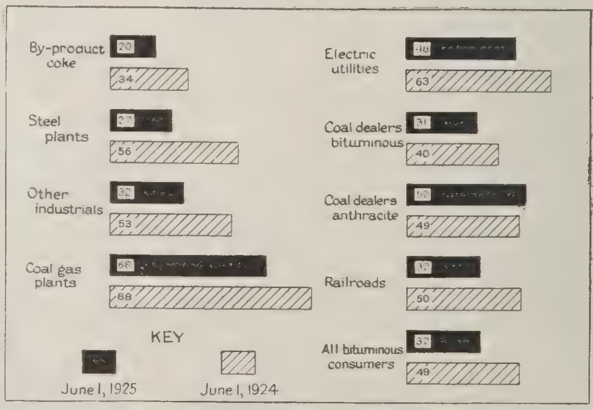

Fig. 2—Days' Supply Held by Different Classes of Consumers, June 1, 1924, and June 1, 1925

At the rate soft coal was burned from March 1 to May 31, 1925, the total quantity in storage on June 1 was sufficient to last 32 days on the average against a 49 days' supply on June 1, 1924, at the rate of consumption then prevailing. The tonnage now in reserve is 25 per cent less than that a year ago and because of the increased consumption would last only two-thirds as long.

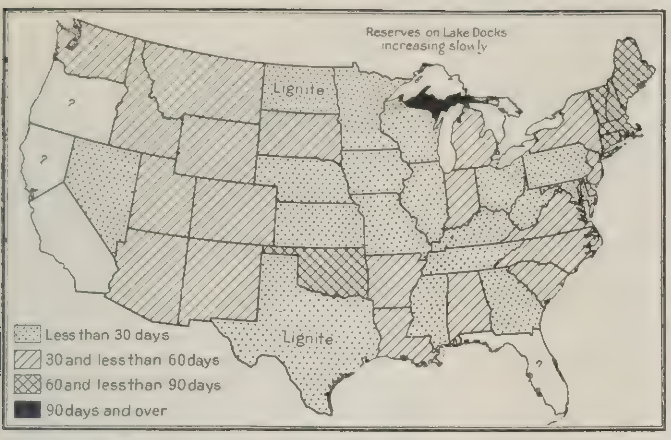

**Fig. 3—Days' Supply of Soft Coal on Hand at Industrial Plants June 1, 1925**

Distribution by states of the 32 days' supply of soft coal held at industrial plants, other than steel and byproduct coke works. Stocks generally were light and in the northern peninsula of Michigan only was there a 90 days' supply. New England and most of the Atlantic Coast states had a 60 days' supply. With but few exceptions, the interior states west to the Rocky Mountains had less than a 30 days' supply.

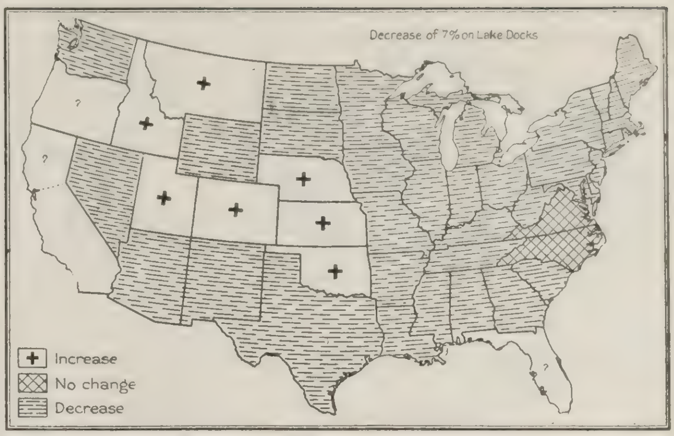

**Fig. 4—How Stocks at Industrial Plants on June 1, 1925, Compared with Those on June 1, 1924**

The map shows how widespread has been the reduction in soft-coal reserves at general industrial plants. Increase in stocks over those of a year ago were confined to a group of Western states. Except in that territory and in Virginia and North Carolina, reductions in stocks have been universal. This change relates to actual tonnage on hand and in no way reflects the rate of consumption.

(*a*) The figures in this table are estimates based on incomplete data. (*b*) See text for rate of consumption at which these figures were calculated. (*c*) No data. (*d*) Subject to revision.

---

plants, with a 27-day reserve, had less than half of the total for the earlier date.

Reports from the railroads, furnished through the courtesy of the American Railway Association, indicated that the total railroad fuel in reserve was in the neighborhood of 10,500,000 tons, a supply sufficient to last 32 days at the present rate of consumption. A year ago the railroads had a 50 days' supply.

At the rate of delivery of soft coal to the householders this spring, retailers' stocks on June 1, 1925, were sufficient to last 31 days. At the rate of delivery during the summer of 1924, the stocks on June 1, 1924, would have lasted 40 days. Compared with stocks on the corresponding date two years ago there was a decrease in the actual tonnage on hand, but because of the reduced rate of delivery the present supply appears slightly higher.

The total quantity of soft coal in transit has never been measured accurately, but available information indicates that the quantity in transit from the mines on March 1, 1925, was about three quarters of a million tons more than on Sept. 1, 1924, and on June 1 it was a million and three quarter tons less than on March 1.

Bituminous coal stored by producers on June 1, 1925, was barely 150,000 net tons. On June 1, 1924, the same companies reported 370,000 tons, and in the spring of 1923, more than 800,000 tons. The total quantity of unbilled coal in cars at the mines on June 1 was about 800,000 tons, a decrease of 200,000 tons from the figure for March 1.

The Lake season of 1925 opened early and shipments up the Lakes, to the end of May, exceeded those during the corresponding period of 1924 by more than 1,000,000 tons, but were about 1,000,000 tons less than in 1923. The tonnage moved off the upper docks about as fast as it was received, however, and there was but little accumulation of reserves. Reports furnished by the Lake Superior Coal Dock Operators' Association and the dock operators of Lake Michigan show the following total stocks: June 1, 1925, 3,800,000 tons; March 1, 1925, 3,840,000 tons; June 1, 1924, 4,150,000 tons; June 1, 1923, 1,591,000 tons.

Stocks of unsold coke at 21 byproduct plants supplying gas for city use were greatly reduced during the winter of 1924-25 and the total remaining on March 1—606,000 tons—was 45 per cent less than the quantity on hand last September. The unsold supply increased slightly during the next three months and on June 1 the total was 694,000 tons. The record of coke stocks on recent dates for which statistics are available has been as follows: Jan. 1, 1924, 772,000 tons; June 1, 1923, 202,000 tons; Jan. 1, 1923, 212,000 tons; March 1, 1922, 987,000 tons.

Unlike bituminous coal, large quantities of anthracite are stored at the mines or at intermediate points en route to consuming centers. Unfortunately it has been impossible for the government to obtain complete information on this important subject, and accurate total, therefore, cannot be given at this time.

## New York Anthracite Prices For July, 1925

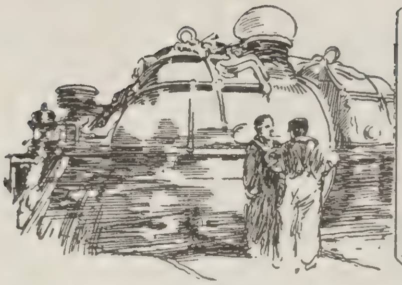
(Per Gross Ton, f.o.b. Mine)

| | Broken | Egg | Stove | Chestnut | Pea |
|---|---|---|---|---|---|
| Lehigh & Wilkes-Barre Coal Co. | $8.15 | $8.55 | $9.05 | $8.55 | $5.00 |
| Lehigh Valley Coal Sales Co. | 8.25 | 8.60 | 9.05 | 8.80 | 5.00 |
| Lehigh Coal & Navigation Co. | 8.80 | 8.80 | 9.20 | 8.70 | 5.35 |
| D. L. & W. Coal Co. | 8.25 | 8.55 | 9.05 | 8.55 | 5.25 |
| Hudson Coal Co. | 8.55 | 8.55 | 9.05 | 8.55 | [illegible].80 |
| Phila. & Reading Coal & Iron Co. | 8.80 | 8.75 | 9.15 | 8.75 | 5.40 |
| M. A. Hanna & Co. | 8.50 | 8.80 | 9.30 | 8.80 | 5.45 |

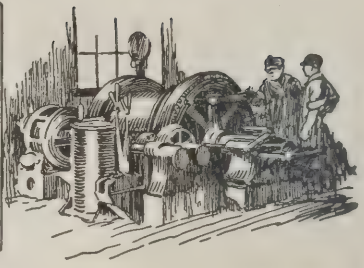
Steam sizes: Buckwheat No. 1, $2.50; rice, $2; barley, $1.50; birdseye, $1.60.

In the construction of public buildings little attention has been given to furnace location with the idea of facilitating the handling of coal. A recent survey of public buildings in the District of Columbia disclosed that costs of handling coal from the truck to the firebox varies from 37c. to 42c. a ton. Conditions in this respect are practically as bad in buildings recently constructed as in the older ones. The matter has been the subject of consideration at a conference with the Supervising Architect.

After numerous postponements, Robert M. Lambie, of Charleston, chief of the West Virginia Department of Mines, has announced that the inquest on the Barrackville explosion by the coroner's jury will be continued in Fairmont on Thursday, July 16.



# Practical Pointers For Electrical And Mechanical Men

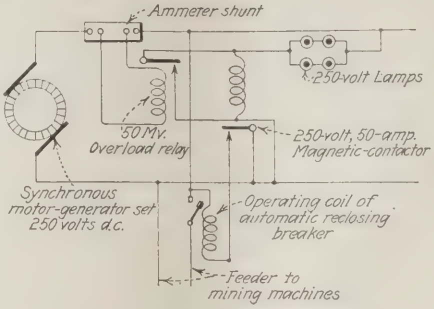


## Device Reduces Peak Loads on Motor-Generator and Saves Time

Peak loads, not average loads, are the ones which ordinarily limit the practical capacity of mine substation equipment. Reducing or limiting the peaks is usually equivalent to installing additional generator capacity. A specific instance of such a case is that at the Shamrock mine of the West Kentucky Coal Co., at Providence, Ky.

A year or so ago the direct current power plant at this mine was abandoned in favor of purchased power and a 300-kw. synchronous motor-generator set installed. It was soon found that the motor-generator would not handle the peak loads if the field of the synchronous motor was adjusted to give the desired power factor at the average load.

The operating condition was this: If the power factor was adjusted to 80 per cent leading at the normal low load of 200 to 300 amp. then it would drop to 80 per cent lagging at the full load of 1,000 amp., and the synchronous motor would pull out of step at peaks of over 1,800 amp. If the power factor was adjusted to 90 per cent leading at 300 amp., then the motor would pull out at 1,500 amp.



Ammeter shunt
250-volt Lamps
50 Mv. Overload relay
250-volt, 50-amp. Magnetic-contactor
Synchronous motor-generator set 250 volts d.c.
Operating coil of automatic reclosing breaker
Feeder to mining machines

**Fig. 2—Diagram of Connections**

The added apparatus is used in connection with the ammeter shunt, and with the automatic-reclosing circuit breaker of the mining machine feeder.

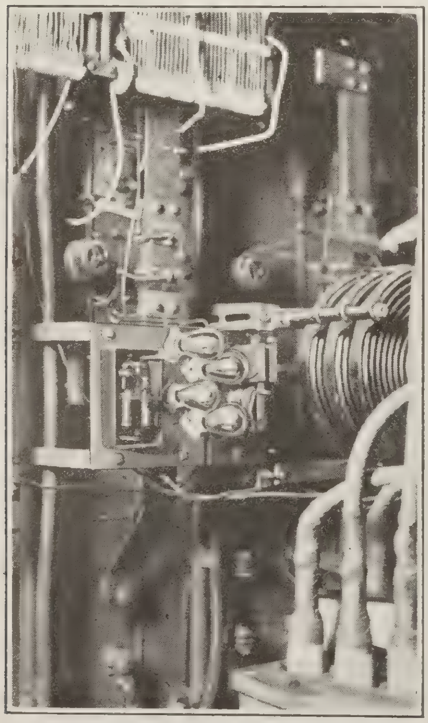


**Fig. 1—Mounted Back of Switchboard**

A 50-mv. relay, four lamps, and a 50-amp. contactor make up the special equipment. These are seen on the bracket in the center of the photograph.

The short time maximum loads of 1,800 amp. or more were caused chiefly by coincident peaks of the one 12-ton and two 10-ton haulage locomotives. The rather steady mining machine load of 200 to 300 amps. was just enough, in addition to the locomotive peaks, to cause the trouble. At the Shamrock mine, as is also the practice at other mines of the West Kentucky company, the mining machines are operated from a separate circuit which is protected by an automatic reclosing breaker installed at the substation switchboard.

This arrangement of the mining machine circuit made possible the installation, at small cost, of a device which obviated the necessity of installing a second motor-generator set. The device opens the mining machine breaker whenever the total load on the substation reaches 1,800 amp., and does not allow the breaker to reclose until the load has dropped to approximately 1,500 amp.

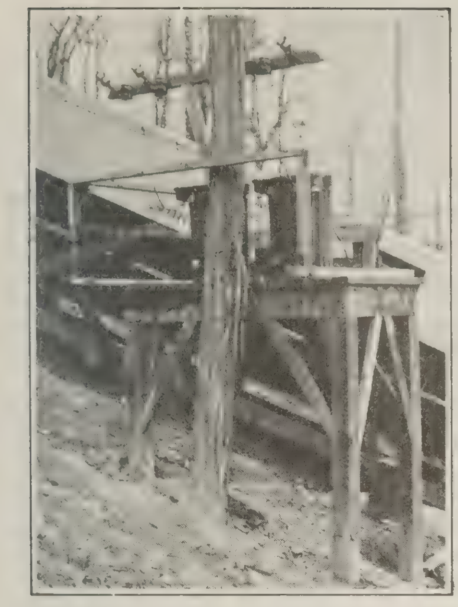
To accomplish this, there was added to the direct-current feeder panel, only that equipment which is seen mounted on the bracket in the left center of the illustration shown in Fig. 1. The combination of a type-T.U., 50-mv. overload relay, a bank of four lamps and a 250-volt, 50-amp. magnetic contactor does the work. The relay has independent adjustments for setting to open and close at the desired current values, and is enclosed in a dustproof metal case, the cover of which was removed when the photograph was made.

A diagrammatic sketch of the circuit arrangement is shown in Fig. 2. The relay coils are connected across the ammeter shunt and the relay contact points across the coil of the magnetic contactor. The lamps are used in series with the contactor coil. The action of the contactor opens and closes the operating-coil circuit of the mining machine breaker.

Sherman Melton, electrical engineer of the West Kentucky Coal Co., states that the device has been entirely satisfactory in operation, and that the delay to the cutting machines, caused by the action of the relay in opening the feeder breaker, is much less than the time loss suffered previously by the whole mine when the main breaker opened or the motor-generator dropped out of step.

## Transformer Mounting Is Safe and Accessible

A marked tendency is shown in new installations to locate power transformers where they can be easily mounted and readily inspected. The illustration shows an installation method which is a compromise between a high-pole and a ground mounting. These transformers, each of 20-kw. capacity, supply power at 220 volts to the 30-hp. motor driving the rope-and-button conveyor at the new mine, No. 5-B, of the Columbus Mining Co., at Allais, Ky. The installation is alongside the retarding conveyor and about 100 ft. from the



Inspection Is Easy Here

This method of installing transformers is a compromise between a high, pole mounting, and a ground mounting. The platform on which these 20-kw., 2,200/220-volt transformers are mounted is 4x8 ft.

dump house in which the motor is located. The secondary leads are carried under the conveyor roof from the transformers up to the motor.

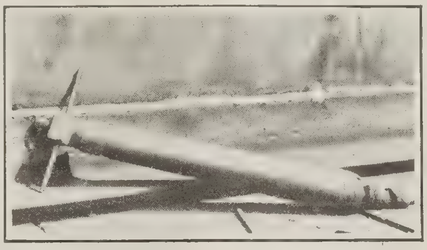
As located, the transformers are accessible for inspection and for the renewal of fuses without the aid of pole climbers or a long ladder, and yet they are high enough above the ground so that they do not require a protecting fence.

## Resistance Terminal Makes Good Electrode Holder

Electric welding does not of necessity require the purchase of special equipment, however, most users prefer to buy factory-made outfits. Mine electricians and mechanics are noted for their resourcefulness and ingenuity in contriving to use what is at hand. An example of this is the electrode holder illustrated in the accompanying photograph.

A ⅜-in. terminal from a mine locomotive resistance unit forms the "business end" of this holder. The hollow wooden handle is 12 in. long and 1⅜ in. in diameter at the large end. The flexible cable is not connected directly to the terminal but instead is soldered to a strip of copper which, in turn, is riveted to the terminal. The object of this is to keep the soldered joint away from the heat of the arc.

The ideal electrode holder should be, (1) of light weight, (2) constructed so that the electrode can be conveniently and quickly changed, (3) not easily damaged by an arc from the holder to the work, (4) made so that it holds the electrode securely and makes good electrical contact to it, (5) rugged, (6) compact, and (7) cheap to build. The holder described here fulfills most of the above requirements, except, possibly, that of quick changing of the electrode. It was observed, however, at the Wayland, Ky., shop of the Elkhorn Coal Corporation, where this holder is used, that the operative seemed to lose comparatively little time in changing electrodes, although he had to use a wrench each time to tighten the setscrew. R. R. Schillenger, electrical engineer, stated that, everything considered, this electrode holder is about as satisfactory as any his company has tried.

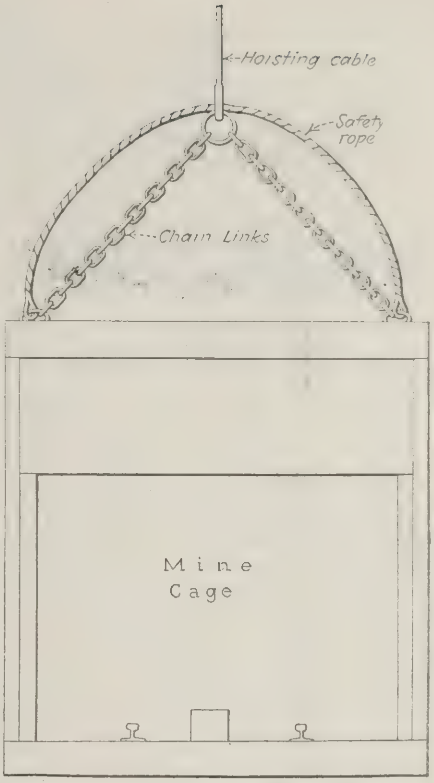


Nothing Complicated About This Home-Made Holder

The setscrew must be tightened with a wrench, but the welding time lost in this way in average mine repair work is negligible. The electrode can be clamped in the middle and used from either end.

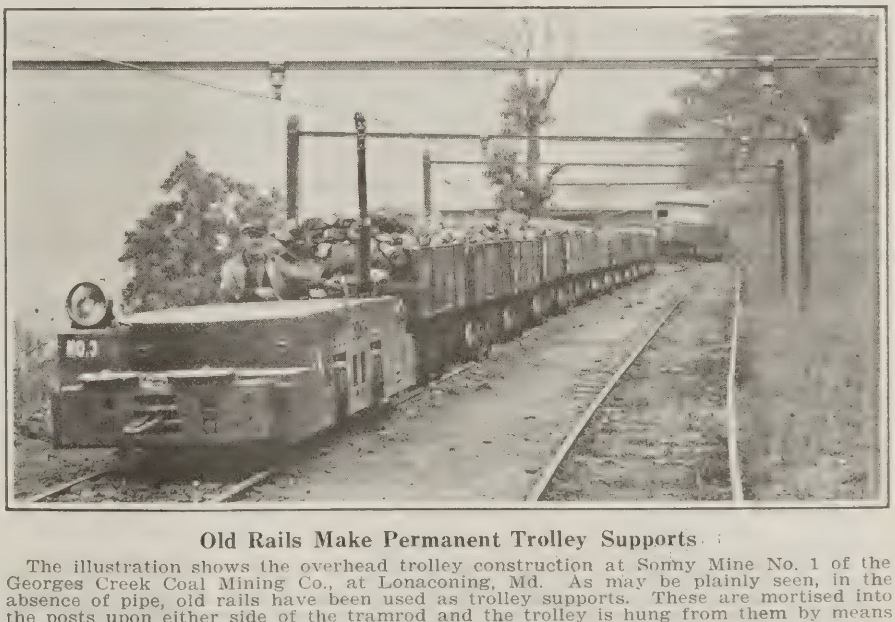
## Safety Rope Halts Cage

Many different ideas have been developed at the J. K. Dering mine near Eldorado, Ill., to insure safety to the workmen. At this mine an auxiliary cable attachment is put on the top of the hoisting cage, as shown in the accompanying illustration, to prevent an accident to the workmen or cage if the permanent chains which connect the hoisting cable to the cage should break. The arrangement is such that should one of the chains fail, the safety rope prevents the cage from tipping and binding in the shaft. Periodically the chains are inspected and renewed, thus the liability of an accident is greatly minimized.



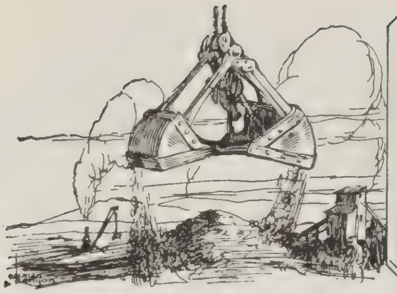
Auxiliary Attachment Catches Cage

The heavy safety rope is fastened to the cage by separate attachments, thus giving more complete protection against accidents.



Old Rails Make Permanent Trolley Supports

The illustration shows the overhead trolley construction at Sonny Mine No. 1 of the Georges Creek Coal Mining Co., at Lonaconing, Md. As may be plainly seen, in the absence of pipe, old rails have been used as trolley supports. These are mortised into the posts upon either side of the tramrod and the trolley is hung from them by means of ordinary pipe clamps.



# Production And the Market

## Soft and Hard Coal Trades Await Effect Of Labor Developments

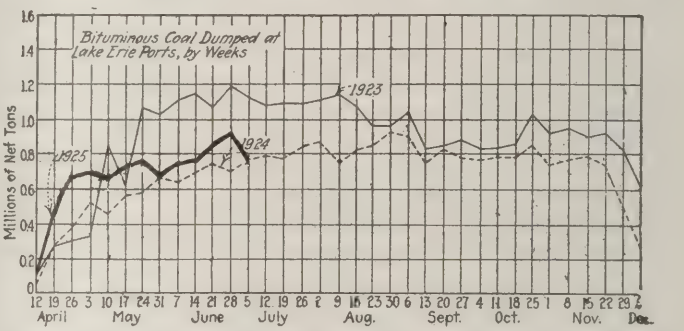
While actual business conditions in the marketing of coal showed little discernible difference during the past week from recent preceding weeks, nevertheless two recent developments are fraught with far-reaching possibilities to the trade—the threat of a nationwide strike by John L. Lewis and the report of coal stocks by the Geological Survey. The industry as a whole will take the Lewis threat calmly, knowing the size of the job the union leader already has on his hands in West Virginia and confident that the government would quickly step in in the event of a dangerous tie-up at the mines. Realization of the extent of the shrinkage in reserve coal stocks, as revealed in this week's report, may be a different story. Whether it will prove to be the needed impetus that the market lacked, the next few weeks will show.

A shipment of western Kentucky strip mine-run that sold in Chicago last week on the basis of 95c. per ton f.o.b. mine gave the Midwest market another bump, shaking the confidence of Illinois and Indiana producers who were trying to maintain prices on 2-in. screenings. Western Kentucky is in poor shape and eastern Kentucky is dissatisfied with prices, a plentiful car supply and many mines running full making coal too plentiful. Business at the head of the lakes is at a standstill. Conditions are somewhat steadier in the Southwest, the situation being unchanged in Colorado and Utah.

Lake buying has been heavier during the last week, and as a result the Cincinnati market has stiffened. A slight pick-up is in evidence in southern Ohio also, but there is no change in eastern Ohio. Demand continues light at Pittsburgh. The depression in New England shows no signs of lifting. At New York and Philadelphia sales have not picked up much, but encouraging signs are not lacking.

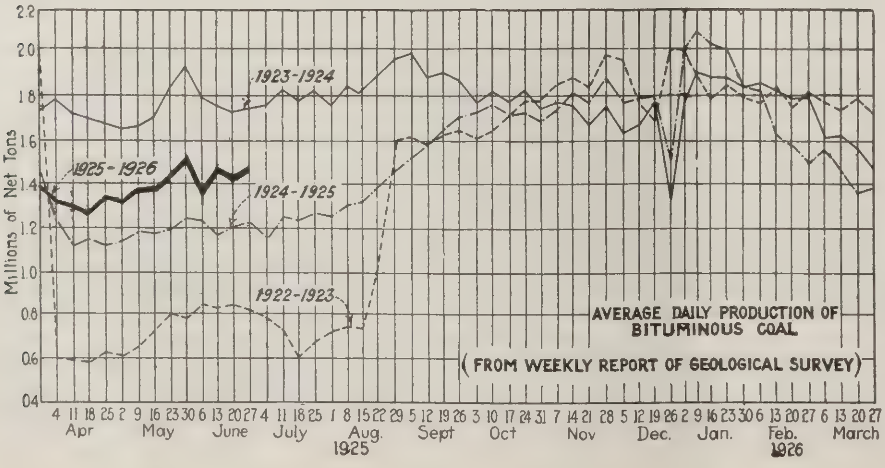
Anthracite consumers display nothing but indifference despite the nearness of the wage parley, but it is not unlikely that a change of front will be in evidence when news from the scene of hostilities begins to spread. Stove continues to lead in demand, with egg close up. Chestnut, however, is causing nearly as much difficulty as pea. The steam sizes are quiet.

Bituminous coal output in the week ended June 27 is estimated by the Geological Survey at 8,679,000 net tons, compared with 8,400,000 tons in the previous week, as shown by revised figures. Anthracite production in the week ended June 27 was 1,844,000 net tons, compared with 1,788,000 tons in the preceding week.



*Coal Age* Index of spot prices of bituminous coal remained stationary during the past week, standing on July 6 at 160, the corresponding price being $1.94.

Dumpings at Lake Erie ports during the week ended July 5, according to the Ore & Coal Exchange, were: Cargo, 733.042 net tons; steamship fuel, 47,258 tons—a total of 780,300 net tons, compared with 912,945 tons in the preceding week. Hampton Roads dumpings in the week ended July 2 totaled 401,083 net tons, compared with 447,290 tons in the previous week.



### Estimates of Production

(Net Tons)

(*a*) Revised since last report. (*b*) Subject to revision. (*c*) Minus two days' production to equalize number of days in the two years.

### Midwest Trade Drags Bottom

A new low level was reached in the Chicago market last week when a considerable tonnage of strip mine-run from western Kentucky was sold there on the basis of 95c. per ton, f.o.b. mines. There was enough of this coal offered to shake the confidence of the Illinois and Indiana producers who have been attempting to maintain a good price for 2-in. screenings. Some of the Illinois and Indiana operators shaded their prices in order to meet this west Kentucky competition, but the majority held their prices firm, asserting that the 95c. mine-run was distress coal and as such ought not to influence the market.

The demand for industrial coals shows no signs of improvement, as mines in the Middle West appear to be able to produce, even on their present curtailed running time, sufficient coal to take care of local industries.

Again Franklin County, Saline County and Williamson County operators have let the first of the month go by without increasing prices, the $2.75 level for 6-in. lump, 6x3-in. furnace and 3x2-in. small egg remaining in effect for July. Shippers of smokeless coal from West Virginia have followed this lead and have decided not to raise their prices in July, either. This is equally true of eastern Kentucky producers, who until at least July 15 will maintain their circular of $2.30 for 4-in. block.

Anthracite operators increased prices 10c. a ton on domestic sizes, effective July 1. They also have served notice that July prices are subject to change without notice. It is believed that the anthracite operators are protecting themselves in case the current strike talk in the hard-coal fields leads to a great increase in demand. The Middle Western public seem indifferent, however, expecting to be able to cover their requirements when they get ready, and if they are unable to get anthracite they feel they can get plenty of smokeless coal or coke.

Conditions are unchanged in southern Illinois. A few cars of domestic sizes are moving out but it has been hard work and some of it has sold as low as $2.35 on Franklin County lump, egg and nut and some coal from the Harrisburg field. Some coal from Duquoin has gone as low as $1.75 for egg and No. 1 nut. However, the retail trade is being asked the same old circular, and that is the principal reason why nearly all the dealers in Illinois have gone to eastern and western Kentucky coal. Railroad tonnage is light from the shaft mines, which are working a couple of days a week, with an exceptional mine getting better time. The strip mines seem to be getting good working time, crushing a lot of coal and have some railroad tonnage.

There has been no change in the Duquoin field and there is practically nothing doing in the Mt. Olive district. A little working time in both of these fields is given over to crushing coal for mine contracts although one mine in

**Coal Age Index of Spot Prices of Bituminous Coal F.O.B. Mines**

| | 1925 | | | 1924 |
|---|---|---|---|---|
| | July 6 | June 29 | June 22 | July 7 |
| Index | 160 | 160 | 161 | 164 |
| Weighted averaged price | $1.94 | $1.94 | $1.95 | $1.99 |

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States, weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and, second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke; 1913-1918," published by the Geological Survey and the War Industries Board.

Jackson County is getting considerable domestic tonnage at circular price. The Standard field continues to sell coal below cost as a rule. Mines are working one and two days a week and railroad tonnage is light. Several mines are crushing for screenings and the price of these have gone down to $1.50 with no advance in the other sizes.

The St. Louis market is unusually quiet. Very little domestic coal is being handled except apartment-house and school contracts, and the price that this coal is being brought in at is not attractive to the dealers who are trying to make expenses. The most noticeable feature of this storage business thus far is the lack of anthracite orders. Railroad coal and smokeless coal are dropping off and coke is not taking the business expected. Oil burners are reported going in at the rate of fifteen to twenty per day and no effort is made by coal men to counteract this movement. Wagonload steam is unusually quiet and carload is just fair, considering. Country domestic is hard to find and there is very little country steam business. No change is reported in prices.

## Much Kentucky Coal Moves at Low Prices

Although Kentucky has been producing close to a million tons of coal a week and moving a lot of fuel, complaint is heard concerning prices in eastern Kentucky, where with adequate car supply and many mines now running full, there is too much coal available for the higher priced operators to advance quotations. All efforts to shove prices above the $2.25 mark on best 4-in. block have failed. There may be a few orders on specialty coals moving at above that figure, or now and then a "sleeper" may be caught, but there is plenty of block at $2@$2.25, with egg and lump at $1.75@$2.10. Mine-run is firm at $1.35@$1.75.

Eastern Kentucky screenings have been offered to large industrial consumers at as low as 90c. at points south of the Ohio River during periods of short embargoes at Cincinnati when the Baltimore & Ohio R.R. was unable to accept all the lake coal coming through. Such embargoes have been only of short duration, slapped on for probably twenty-four hours to relieve congestion at the Cincinnati terminal.

Western Kentucky continues in poor shape, with domestic prepared offered as low as $1.10 for some off grades, and markets at $1.25@$1.50 on good coals. Mine-run and screenings are around $1@$1.25, with some screenings available as low as 90c. in small lots.

## Northwest Trade at Standstill

Despite dullness of trade more ships came through laden with coal last week than in any one week since the opening of navigation. In all fifty-one cargoes were landed, of which nine were hard coal, and eighteen are reported on the way from lower lake ports, of which three are anthracite.

Trade at the head of the lakes is absolutely at a standstill. Nothing but spot coal which is absolutely necessary for the operation of factories is going out, and this does not begin to keep up with shipments to the docks. The docks are piling up, and serious congestion may result. Buyers are all waiting for a drop in prices, but dock men seem confident that the present levels will continue.

Prices are steady on both hard and soft coal. The usual 10c. a month raise went into effect July 1 on hard coal. This makes egg, $13; stove, $13.40; nut, $13.25; pea remains at $10.10 and buckwheat at $6.50. There are big stocks of hard coal here but the dock men hope to get rid of them in the fall. The Northwest is not frightened, however, by any possibility of a hard-coal miners' strike as most householders will use Pocahontas anyway.

Briquet manufacturers are lining up for the season, expecting a large amount of business among former users of hard coal who want briquets instead of soft coal.

In the Twin Cities buyers are more than reluctant to buy coal in advance of needs, and feel little urge to do so, believing that they can get as good a price when they can use the coal, sixty days later, as they can now. Some railroad business has been discussed a little, but otherwise very little has been doing in any direction. Commercially, the general situation is one of awaiting developments. Prices continue as they have been. If crop conditions continue to be as promising for another month as they have been up to this time, the Northwest seems to be in line for a good volume of business this fall. And it will include a material addition to the coal movement. Buying and production have been on a limited scale for a long time, and a little increased buying would start a better volume in manufacturing and jobbing, with an increased need for coal all along the line.

Little can be said about the Milwaukee coal situation during the prevailing summer dullness. Cargoes are arriving steadily and dock managers seem to be looking out for their usual supplies for another winter. Naturally they are disturbed to some extent by the wage scale differences of operators and miners, and naturally also they are hoping that consumers may feel inclined to protect themselves by filling their bins early. Retail prices for anthracite were pushed up 10c. in Milwaukee with the beginning of July. Egg now is sold for $16.20 spouted and $16.95 carried in; stove for $16.60 and $17.35 respectively; and nut for $16.45 and $17.20. The prices of pea and buckwheat were not raised correspondingly. Pocahontas nut now sells for $10.25 spouted and $11 carried in.

## Southwestern Market Steadier

The movement of a little coal for threshing and school storage has had a steadying effect on the Southwestern market. While there have been no changes in prices, those in effect are firmer than they have been, and, with production reduced to the demand, no surplus is accumulating at the mines. No domestic storage is reported, but it is expected to start late this month or early in August, providing a market which will open up Arkansas mines, virtually all of which are now closed.

In Colorado there has been no improvement in coal conditions. Dealers continue to withhold orders until the rate reductions to the Missouri River territory become effective.

Aug. 4. Mines are operating on an average of about two days a week with an oversupply of labor. The new prices for Dawson and Raton domestic lump and fancy egg are \$4; fancy nut, \$3.75; fancy pea, \$3.25, and base-burner coke, \$6.

The Utah coal business is about normal for this time of year. The chief industrial consumers are the mines and smelters, but the railroads, cement plants and sugar companies are taking a little coal. The domestic business is doubled due to weather conditions. The slack situation continues easy, but, thanks to the storage capacity of the mine-owned yards, lump coal being mined is not the problem it would otherwise be. The price situation is unchanged and there is an abundance of labor.

### Cincinnati Market Stiffens

Cincinnati sees far-reaching possibilities in the word that one company that has done much in setting prices in the past ten months will place a price of \$2.25 on its 4-in. lump and \$2 on its egg and 1½-in. screened coal on July 15. This corporation, which operates in some of the finest veins in the Island Creek district of West Virginia, has held consistently to \$2 and has produced heavily during the period alluded to.

Lake buying has been rather heavy within the past week, mostly of mine-run. Screenings, too, have been affected and the price has advanced again to a solid \$1.10@\$1.15, with some of the first asking as high as \$1.25. Stove and egg continue fairly strong, but domestic lump lags.

The smokeless situation is difficult to gage. Some looked for a July rise because of light domestic and retail buying, but lump is limping along at \$2.75 spot, with some direct selling agents holding to \$3. Stove sizes are weak and most of the nut is going at the straight mine-run price. Mine-run is now firm at \$2 and screenings also have stiffened a bit through the advance of bituminous, with a range of \$1.25@\$1.35.

The speech of John L. Lewis at Scranton has been seized upon as food for buying talk and retailers and dealers in domestic sizes have been urged to get a move on before the clouds break.

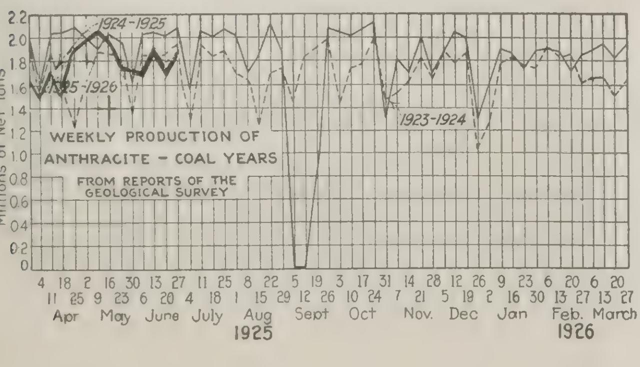
In a retail way there has been little or no change. Home storage now is said to be the lightest in five years. River movement continues good with the stream benefited by rains both on the tributaries and in the upper valleys.

Only a slight change has taken place in the southern Ohio coal trade during the past week. As reserves are getting low some of the larger users are buying in larger quantities. Domestic demand has not increased materially, as dealers have not started to take in tonnage. The market is still somewhat irregular although both producers and distributors believe that a better demand will develop later in July.

Utilities, railroads and public institutions, including schools, are taking a pretty good tonnage of steam sizes. A fairly steady demand from other sources has kept the market fairly clean. The amount of distress coal has been reduced to a large extent and the extremely low quotations heard several months ago are not found at this time.

Buying on the open market is the practice of many large consumers not having contracts. Railroads are still buying on the market in preference to entering into contracts, although a few of the carriers have made agreements for a good tonnage. Nut, pea and slack are rather firm, due largely to the reduced production of lump, and this condition is expected to be maintained for several weeks. West Virginia slack is following the lead of Ohio-mined grades and has strengthened.

Lake trade is rather steady and a part of the tonnage is coming from Ohio mines. Movement of bottoms has been rather good and reports show a good tonnage landed at the head of the lakes.



Retailers in central Ohio are at sea as to stocking. So far householders have shown little disposition to buy and as a result the dealers are playing a waiting game. Retail prices have stiffened to a certain extent, although some dealers are still cutting in order to clean up their yards.

There has been no change in the eastern Ohio market situation; general demand is showing little life and spot prices are holding at the level of recent weeks. Steam demand is not sufficient to develop into inquiries and producers are keeping well ahead of industrial needs. Operators and jobbers simply describe the situation as being the worst through which they have passed in many years and are unable to point to a single constructive factor likely to change conditions in the near future.

Production at mines in the eastern Ohio No. 8 district during week ended June 27 increased 14,000 tons over that of the preceding week. Total output was 237,000 tons or about 34 per cent of potential capacity. Two additional mines have resumed operations, but one is an industrial mine whose output is wholly taken by a large industrial concern.

### Conditions Unchanged at Pittsburgh

At Pittsburgh slack is said to be a trifle easier, but this is denied by some well-posted authorities. There has been a little search for nut coal, which is not so easily found, as its production depends on the vagaries of lump shipments. In general, however, the coal market is unchanged. Demand remains very light, and prices, except occasionally in the case of slack, are changed, having long ago gotten to the irreducible minimum. Operation in the Pittsburgh district continues to be guessed at around 20 per cent of capacity.

The Buffalo bituminous trade continues its recent course though the more active shippers quite often show a pretty fair string of orders, but this is not common enough to be very encouraging. Consumption seems to be pretty good. Quotations continue at \$1.60@\$1.75 for Fairmont lump, \$1.40@\$1.50 for mine-run and \$1.25@\$1.40 for slack; \$2.25@\$2.50 for Youghiogheny gas lump, \$2@\$2.25 for Pittsburgh and No. 8 steam lump and \$1.30@\$1.50 for slack; \$1.75@\$2 for Allegheny Valley mine-run. Cambria County smokeless retails at \$6 at the curb for domestic use.

### Seasonal Lull Deepens New England Calm

The steam coal market in New England continues under the same depression that has been characteristic now for a long period, and the dullness usual in midsummer only accentuates it. Buyers have next to no interest whatever in current offerings and prices keep wavering with the individual situations of the several shippers. Quotations of \$4.10@\$4.15 per gross ton f.o.b. vessel at Hampton Roads are by no means unheard of, even for highest grade Navy standard, and apparently there are fewer and fewer instances of higher returns. Eastern New England supplies much the greater outlet for what coal is dumped at Norfolk, and Newport News, but besides deliveries on contract there are only occasional sailings for this territory.

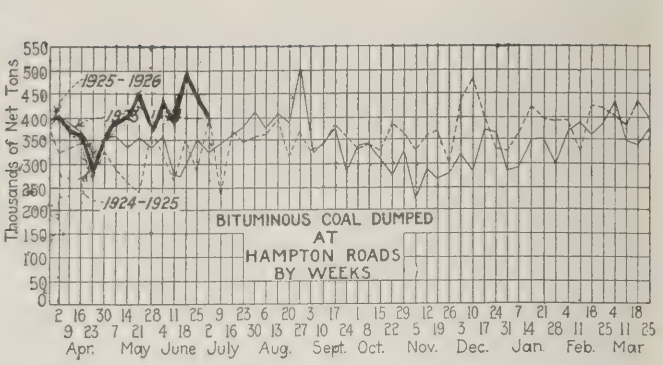
On cars Boston and Providence there is only occasional inquiry. While coal is being held at \$5.25@\$5.40 sales are still being reported at \$5.10@\$5.15, although the various factors try not to quote these figures except on 500- or 1,000-ton lots for spot shipment.

Central Pennsylvania coals in this market are now mentioned scarcely at all. Prices are quoted occasionally, but so large a number of operators have shut down awaiting an adjustment in wages that only a relatively few different coals are available.

Most of the industries here are on part time with only slack business. Practically every consumer of any size is using less coal this year than in 1924 because of the general commercial situation, although this loss is in part made up by the more extended use of bituminous in place of anthracite for domestic purposes.

### Encouraging Signs at New York

Judging from complaints heard, no one is buying bituminous coal in the New York market. There are some encouraging signs, however, sales agents saying that business was a trifle more active last week and that, judging from inquiries received, consumers are showing more interest.



Operators of non-union mines say that business has been better and they believe it will gradually increase. Prices, however, fail to show any change from last week and for several previous weeks.

The "spot" contract awards of the U. S. Shipping Board for coaling vessels in this harbor have been an outlet for several thousand tons of coal for local houses, although the prices have been low.

In a general way everything is quiet in the Philadelphia market, yet producers are moving a little more coal. Concerns with contracts seem to be willing to take larger supplies, and this, with railroad business, has been sufficient to create fair activity for certain shippers in this district. Of course, the real difficulty continues to be low prices.

In the gas-coal market slack is still most wanted, and if anything there is a little better supply of it. The price remains not far from that of mine-run.

Nothing new has developed at tide, and outside of bunkering, activity has almost ceased.

At Baltimore the first reflection of the British labor situation comes in a sharp increase in inquiry for American coals for foreign delivery in the past few days and the renewal of at least some shipping activity to foreign ports. The call for home consumption is extremely light and prices remain on the same level at which they have been set for several months past.

### Better Outlook at Birmingham

Inquiry for domestic coal at Birmingham is reported from some quarters to be picking up slightly, but opinion in the trade as to any material improvement in spot buying or the making of contracts during this month is divided. Some of the larger producers report the outlook as having improved perceptibly in the past few days with July spot bookings sufficient to take care of their entire output above contract obligations. Others haven't orders in hand as yet to absorb their surplus output entirely, but feel that such business will be taken on from day to day as will enable operations to carry on at least on a parity with the schedules observed in June.

Generally speaking, there is little change in the steam market. Ice plants are consuming about their maximum tonnage at this time and the power companies also are using considerable fuel at their steam operations. Railroads are taking about the same amount of coal as for several weeks past, and cement plants and textile industries are operating full time, using a large amount of fuel. Buying in the open market is for current needs and few new contracts are being taken on.

Quotable mine prices on all grades are the same as a week ago. The mines are operating on a basis to care for business in hand or reasonable anticipations under the market conditions and there is little surplus fuel. Lump and other domestic sizes are not moved as readily as desired in all cases, but there is no serious delay in disposition.

### Hard-Coal Trade Neglected

Producers and shippers of anthracite are doing little more than marking time in the New York market. Consumers are indifferent despite the possibility of a suspension of mining at the end of next month.

The larger companies, as was expected, advanced the prices of the domestic coals 10c. per ton on July 1. The relative position of the larger sizes of hard coal did not change last week. Stove continues to head the list in demand, with egg close at its heels. Chestnut seems to be causing nearly as much trouble as pea. Along the line the former is in better demand than in the Metropolitan area. The smaller coals are quiet, with No. 1 buckwheat in oversupply. Barley is holding its own while rice is in fair demand.

The trade at Philadelphia is on about the same level as last week, although there are prospects of some improvement. Since the miners got together to formulate demands, the public is taking a little more interest. No doubt the coming week should see an increase in retail buyers.

Most operators have been losing some time at the mines, but are in hopes that with a little improvement they will be enabled to go through to Sept. 1 without any more production losses. While most dealers are filled up with coal, news from the miners' meeting enables them to find space for an occasional additional car.

As expected, all operators added 10c. a ton for July to the mine price of egg, stove and nut, with nothing added to pea and the smaller sizes. Steam sizes are draggy, especially buckwheat, and the independents are willing at times to shade 25c. and better on fair sized blocks of this size. Much the same is true of rice, and while barley moves fairly well there is more than a plentiful supply.

Anthracite selling in Baltimore is almost at a standstill. Neither the public nor the dealers are convinced that a hard-coal strike is coming. Should a feeling grow that a strike is inevitable, even one of short duration, there will be a rush of dealers to get through deliveries from the mines, and then the buying public will hustle in an effort to get under cover. Prices remain so far on the same schedule as for June.

Buffalo hard-coal dealers agree that the trade is much duller now than usual in warm weather and they are all at a loss to know why. The public does not appear to be much disturbed at the possibility of a strike and it is doubtful if a single load of coal has been sold on the strength of what may happen at the present wage meeting.

As to coke it does not appear that anybody wants any, Canada was buying, but now it is all Alberta coal, though local shippers do not appear to fear that much. It must be classed along with soft coal at the best and we can sell that much cheaper than Alberta coal goes for, on a $7 freight rate from the mines.

Lake coal shipments are now pretty nearly all going over a single dock and when the upper lake docks are all full that will have to slow up too. For the week the amount loaded was 59,100 tons, of which 32,800 tons cleared for Duluth and Superior, 10,000 tons for Milwaukee, 6,500 tons for Chicago, 5,500 tons for Fort William, 3,000 tons for the Sault and 1,300 tons for Racine. Rates are unchanged.

### Connellsville Coke Market Sluggish

A few additional Connellsville merchant coke ovens have gone out, on account of expiration of contracts July 1, and the whole situation is virtually settled until some important change occurs in blast-furnace operations. The furnaces that will operate, such as normally use purchased Connellsville coke, are covered by contracts for the third quarter or half year, one of these having byproduct coke from Youngstown. It is understood there is more to be had there at $2.75, Connellsville equivalent, a price it is generally assumed Connellsville operators would not try to meet. Possibly they would shade $3 a trifle if opportunity presented itself, but there is no inquiry.

So far as known there was no buying for the single month of July and there has been no spot demand from furnaces for some time, which confirms the understanding that all the furnaces to operate are taken care of.

The contract market remains quotable nominally at $3@$3.25. Operators might in future ask more than has been done on contracts, which were chiefly at $3, because recent selling was to get a backlog only.

Spot foundry coke remains at $3.75@$4.25 and is dull.

# Foreign Market And Export News

## Depression in British Market Hits Steam Coal Trade

The general situation in the British steam coal trade leaves much to be desired, and even the anthracite trade is not so brisk as it was a few weeks ago, the result being that prices are much lower. The existing depression, however, affects the steam side of the industry most, as there is absolutely no life in the market, for the reason that foreign demand is so meager, owing partly to the keen competition from other coal fields and partly to the fact that foreign exchanges are so adverse to business.

The possibility of untoward developments in the labor situation fails to stimulate demand from abroad. It is, therefore, not surprising that there is a lack of loading pressure at most of the South Wales docks and that many collieries are experiencing some difficulty in finding an immediate outlet for their output, notwithstanding the numerous pits that are idle.

There is no improvement in the Northern coal trade, as buyers still hold off. There are inquiries on the market, but they are distributed over a large number of merchants, and though giving the impression that there is a large volume of trade, they really amount to little. Reports from Continental centers do not give much encouragement of a revival of interest for some time to come. Merchants recently returned from business journeys in Germany, France, Belgium and Holland state that they did not find much improvement in the demand for coal. Germany has very large stocks to dispose at low prices.

Production by British mines in the week ended June 20, a cable to *Coal Age* states, totaled 4,465,000 tons, compared with 4,980,000 tons in the preceding week.

### Holiday Slump at Hampton Roads

Business at Hampton Roads continued dull last week, particularly with the holiday in sight and the mines shutting down three days. Most mines serving this port were operating only three days a week anyway.

Inquiries were decreasing and foreign shipments were falling off materially. The Shipping Board took several 1,000-ton lots as low as $4.08, the lowest figure quoted for many weeks. Some distress coal was being offered nearly that low. The tone of the market was weak.

### French Trade Stationary; Strike Averted

The situation in the French coal market is still extremely trying; consumption has not increased and stocks are practically stationary.

In order to settle the wage controversy the mining companies proposed that instead of revoking the 40 per cent allowance for the high cost of living it be cut to 20 per cent. The men accepted this proposal, and the threatened strike has been averted.

To help the sale of French coals, a proposal to reduce transport tariffs to the west is being considered, but the railway companies, whose condition is far from prosperous, are not inclined to face a cut with equanimity. Import licenses for foreign fuels, particularly German coals, have not been re-established due to opposition by railways and metallurgical plants.

In May the Office des Houillères Sinistrées received from the Ruhr 591,900 tons of indemnity fuels (against 583,500 in April), including 267,500 tons of coal, 292,100 tons of coke and 132,399 tons of lignite briquets, a daily average of slightly more than 19,000 tons. From June 1 to 6 the receipts were 20,500 tons of coal, 53,200 tons of coke and 2,700 tons of lignite briquets.

During the first seventeen days of June the O.R.C.A. received from the Ruhr 147,135 tons of indemnity coke.

# News Items From Field and Trade

## ALABAMA

Statistics for 1924 just completed by Chief Mine Inspector C. H. Nesbitt show that coal output for the year in Alabama aggregated 19,615,931 net tons as compared with 20,919,303 for 1923, which was the record production for this field. A total of 4,620,282 tons of coke was produced, as against 4,689,641 for the previous year. Of the coke production, 4,455,990 tons, or 96.4 per cent, was made in byproduct ovens. There were 77 fatal accidents during 1924, or one for every 361 employees, and one life was lost for every 254,752 tons of coal mined. This field worked 177 days and there was an average output of 705 tons for each employee in the industry. Statistics show that 16,024 miners were employed, 7,076 inside daymen and 4,729 outside daymen, or a total of 27,829. Of the total output of coal 12,587,605 tons was washed, or 64.2 per cent. From present indications production for 1925 will show a material decrease as compared with 1924.

## COLORADO

Three miners were killed and two other men were injured June 19 as the result of an explosion in the Gordon mine, six miles northwest of Walsenburg. Lack of proper ventilation was held responsible for the explosion in the verdict returned last week by a coroner's jury under the direction of Coroner Dave Murphy. Blame for the fatal accident was placed upon officials of the mine, but was not directed at any particular official, and there were no definite charges to indicate that criminal prosecution would result.

## ILLINOIS

Representatives from the mining and selling organizations of the Bell & Zoller Coal Co. recently organized an automobile caravan which made a week's tour of Missouri, Illinois, Iowa, Wisconsin and Minnesota cities boosting Zeigler coal as well as the city itself.

Donk Bros. Coal & Coke Co., East St. Louis, has increased its directors from five to nine.

Chester A. Harris, who until recently was associated with the Southern Gem Coal Corporation, is now with the Forsythe Coal Co., with headquarters in Chicago.

The Forsythe Coal Co., after months of intensive work, expects to start stripping operations on its properties west of Ward station, on the Illinois Central R.R., early in July. The company is at present employing about 35 men. The plans call for the stripping of a 200-acre tract first, after which other large tracts held under lease by the company will be mined by the same method.

## KANSAS

The Home Riverside Coal Co., operating two mines at Leavenworth, notified its 350 employees June 30 that they must revert to the 1917 wage scale or close down. No action was taken by the miners pending discussion of the situation with district officials.

The executive board of District 14, United Mine Workers, voted June 23 to submit to a vote of the district a proposal to increase from 4 per cent to 6 per cent the tax levy on employed miners for the relief of the unemployed in the district.

The Doubleday Coal Co. mine near Gross, at which United Mine Workers demonstrations have been frequent in recent months, and which has been idle several weeks as a result of the activities of the union to prevent it operating open shop, resumed work July 1, under the 1924 contract. The contract was signed June 29. It is between union officials and W. H. Barrett. Mr. Barrett, for some time general superintendent for the Doubleday company, is understood to have a lease arrangement with the owners. One hundred and forty men are employed at the mine.

## KENTUCKY

The Letcher Coal Mining Co., Whitesburg, which has been in receivership for some months past, may soon start operations under the receivers, it is reported.

The Kentucky & West Virginia Power Co., furnishing power to a number of mines in eastern Kentucky, reports that power demand from coal companies is the largest in its history. The company is building a new high-tension line from Kona to Jenkins, to furnish auxiliary service to the Consolidation Coal Co.

## MICHIGAN

The reorganization of the old Central Coal Mining Co., Bay City, into the Crescent Coal Co. on a scale to produce 250 tons of bituminous coal daily for local distribution only was announced recently by Charles McNair, one of those interested in the project. A crew of workmen is now engaged at the mine, which is located in the Salzburg district, in pumping the water from the shaft and entries.

## MINNESOTA

Henry Ford has renewed the lease on his dock property at Duluth at the rate of $70,000 a year. He owns all the bonds on the dock at present and has started foreclosure proceedings. This, however, will take about a year, and the dock would not become his until next autumn.

**Tipple at Worley, or No. 4, Mine, Stearns Coal & Lumber Co.**

Worley is in McCreary County, just south of Yamacraw. This plant has shaking screens, two loading booms and car retarders. Sharp curves seem to be characteristic of the Kentucky & Tennessee Ry.

It is said that if he gains title to the dock he will start improvements immediately.

## OHIO

The New York Coal Co., of Columbus, which has been operating a washer in the Nelsonville district, has been compelled to reduce operations at the plant because of an order of the United Mine Workers that co-operative mines must not operate unless the miners can show that they are making union wages. The washer has been operated to a certain extent on product furnished by co-operative mines but a portion of this supply is now lacking.

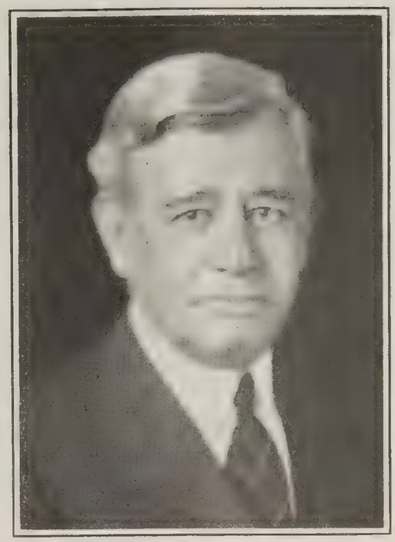
Walter Conradi, who for a long time has been connected with the Logan County Coal Corporation in Cincinnati, has joined the force of the American Coal & Export Co., which has opened offices in the new Atlas Bank Building there.

The Pittsburgh Coal Co. took immediate steps following the burning of the power house at Mine No. 76, at Thomas, to replace the plant and expects to have it in operation within two weeks. The boiler as well as other power machinery was destroyed, putting the mine out of commission. The men employed at the mine were immediately transferred to Syracuse mine of the same company, only a short distance away, and continued production. The output of the Pittsburgh Coal Co. mines in the Pomeroy field is now more than 1,000 tons daily.

Quite a few of the smaller co-operative mines in the Nelsonville district of the Hocking Valley have been closed down recently as a result of the recent speech of John L. Lewis, president of the United Mine Workers. Following the speech the state officials of the miners' union have promulgated an order that all miners working in co-operative mines if not making the regular union wages must cease operations or be expelled from the union. This has reduced the output in the southern Ohio field materially, as about two dozen co-operative mines, employing from 5 to 25 men, were in operation.

## PENNSYLVANIA

During the last week of June the Stineman Coal & Coke Co. and the Stineman Coal Mining Co., having extensive mining operations at South Fork, Cambria County, posted notices that beginning July 1 the rate of wages paid at Stineman Nos. 1, 2 and 4 mines would be reduced 20 per cent, all other working conditions to remain the same. With the appearance of July 1 the mines were closed down, the miners refusing to accept the wage reduction. The Stineman normally employs around 900 men and 500 were at work when the mines closed. South Fork is strongly union, having the largest local union in the United States, and included in its membership is Richard Gilbert, secretary-treasurer of the United Mine Workers of District No. 2.



© Harris & Ewing

**Morton L. Gould**

This is Mr. Gould's latest picture. As the one printed at the time of his election to the presidency of the National Coal Association was of the vintage of 1905, he was persuaded to face a photographer again after two decades. Mr. Gould is a native of Indiana, having been born in Terre Haute. He was educated at Indiana University. He did not enter the coal business at once but engaged in a merchandise brokerage business in Minneapolis and St. Paul and later in Omaha. For a time before becoming affiliated with the coal industry he was connected with a firm in Chicago doing a lumber and tie business. In 1895 Mr. Gould went to the Danville district in Illinois to take a clerkship in the office of a coal company. Five years later he returned to Indiana and became a producer on his own account.

At a meeting of the Board of Directors of the Empire Coal Mining Co. held June 27, the following changes in personnel were made, due to the recent death of William A. Webb, formerly president of the company: G. Webb Shillingford, of Clearfield, formerly treasurer and general manager of the company, was elected president and general manager. He also is vice-president of the Central Pennsylvania Coal Producers' Association and a director of the Empire Coal Mining Co., Pioneer Coal Co., Clearfield Trust Co. and the Pennsylvania Bituminous Casualty Co. E. J. Hauber, Philadelphia, formerly assistant secretary and assistant treasurer, is elected secretary and treasurer of the company. He formerly was connected with the Pennsylvania Coal & Coke Corporation, is a director of the Empire Coal Mining Co. and the Pioneer Coal Co. Charles Leslie Chapman, formerly chief engineer of the company, was promoted to general superintendent in charge of all operations of the company. L. Banks Smith, formerly purchasing agent, will assume the duties of assistant secretary and assistant treasurer in addition to his duties as purchasing agent.

Governor Gifford Pinchot has announced that he has continued the commissions of the following mine inspectors: Bituminous — John F. Bell, Dravosburg; C. P. Byrne, Charleroi; P. J. Callaghan, Bridgeville; F. W. Cunningham, Somerset; Nicholas Evans, Johnstown; Edward E. Girod, Masontown; W. H. Howarth, Bridgeville; William Langan, DuBois; Thomas S. Lowther, Indiana; Alexander McCanch, Monongahela; Thomas A. Mather, Tyrone; John I. Pratt, Pittsburgh; C. B. Ross, Latrobe; Thomas D. Williams, Johnstown, and David Young, Freeport. Anthracite—P. J. Moore, Carbondale; L. M. Evans, Scranton; D. T. Williams, Scranton; Augustus McDade, Taylor; E. C. Curtis, Kingston; John B. Corgan, Kingston; T. J. Williams, Kingston; D. T. Davis, Wilkes-Barre; Frank Kettle, Nanticoke; D. J. Roderick, Hazleton; J. J. Stickler, Hazleton; M. J. Brennan, Pottsville; P. C. Fenton, Mahanoy City; William Reid, Centralia; B. I. Evans, Mount Carmel; P. J. Friel, Shamokin, and Charles J. Price, Lykens.

## UTAH

Among those taken into custody on June 22 for participation in the lynching of a negro in Carbon County were E. E. Jones, superintendent of the Utah Fuel Co., Castlegate; Joseph Parmley, chief clerk of the company; L. T. Davis, the store manager, a night watchman, and another employee of the company. They are being held for murder. The

Courtesy Bertha-Consumers Co.

**Boarding House at Eureka Mine**

Many of the unmarried employees make their home here. In addition to providing the usual necessities, food and lodging, this building contains a poolroom and barber shop.

trouble arose when a negro miner murdered the Castlegate Marshal.

Herbert Z. Lund and others received a lease to 1,578 acres of Utah coal land on June 23. This lease with certain patents granted on account of work done on the old law, makes one of the largest coal estates in Utah. According to the terms of the lease, $100,000 must be spent on development work during the first three years, and in the fourth year the production of coal must reach 75,000 tons. The government royalty is 10c. a ton. Two other smaller leases were granted to other applicants at the same time. Joseph F. Livingston and George W. Ivory were granted a lease of 276.9 acres on the terms requiring expenditure of $10,000 with a minimum production after three years of 8,000 tons annually. Moses Paggi was granted a lease at Coalville of 200 acres. This land is part of a school section.

Judge Tilman D. Johnson has dismissed the suit brought against the Independent Coal & Coke Co. by a group of the Illinois stockholders on the ground of lack of jurisdiction. Hearings will commence at an early date in the case against John H. Tonkin as operator and manager of the company. The stockholders in question desire to prevent exercise of an option held by Tonkin on the property, which was alleged to have been granted to him without the consent of the plaintiffs, the minority stockholders. This company is incorporated under the laws of Wyoming, though its principal place of business and its property are in Utah. Judge Johnson, who presides over the local U. S. District Court, held that the case should have been tried in Wyoming. It is expected that an appeal will be taken to the Supreme Court of the United States.

What is said to be the largest and best coal tipple at any mining camp west of the Mississippi River, has just been completed by the Spring Canyon Coal Co. at its property at Storrs. The big structure cost $200,000 and has a maximum capacity of 4,000 tons per eight-hour day. The new tipple has five loading tracks. An extension type Manierre box-car loader enables the loading of box cars on three tracks at the same time. There are five loading booms which are said to be the latest word in tipple construction. There is also a complete plant for rescreening the small sizes of coal, and in connection with this, there is a "spiralizing" plant for taking the impurities out of the rescreened coal. Three hundred twenty-five tons of steel, exclusive of machinery, was used in the tipple. The camp of Storrs is henceforth to be known as "Spring Canyon."

## WASHINGTON

All the coal mines in western Washington have been invited to join in the annual contest of the Western Washington First-Aid and Mine-Rescue Association, to be held at Black Diamond July 25. A set of problems and a list of prizes are being prepared by John G. Schoning, of the U. S. Bureau of Mines; W. R. Reese, state mine inspector, and Martin Flyzik, director of safety. Teams will compete for the silver cups won last year at Coronado by Bellingham, Newcastle and Burnett. The rescue association has elected D. C. Botting, manager of mines for the Pacific Coast Coal Co., president, and H. E. Harvey, Carbonado, secretary.

## WISCONSIN

The Wisconsin Great Lakes Coal & Dock Co. will install a traveling crane at a cost of $100,000 on its property at Twentieth Avenue and Canal Street, Milwaukee. There is now one crane at the docks, but it was announced that it was not capable of handling the business now coming in and anticipated. When both bridges are in operation the total unloading capacity will be 1,200 tons an hour.

## WEST VIRGINIA

J. D. Rhodes has been promoted from the position of mining engineer to that of general superintendent of the Standard Island Creek Coal Co.'s mines at Taplin, Logan County.

Twenty-one students are enrolled in the short course in coal mining engineering at West Virginia University, Morgantown, this summer. Due to the depression in the industry the attendance has dropped.

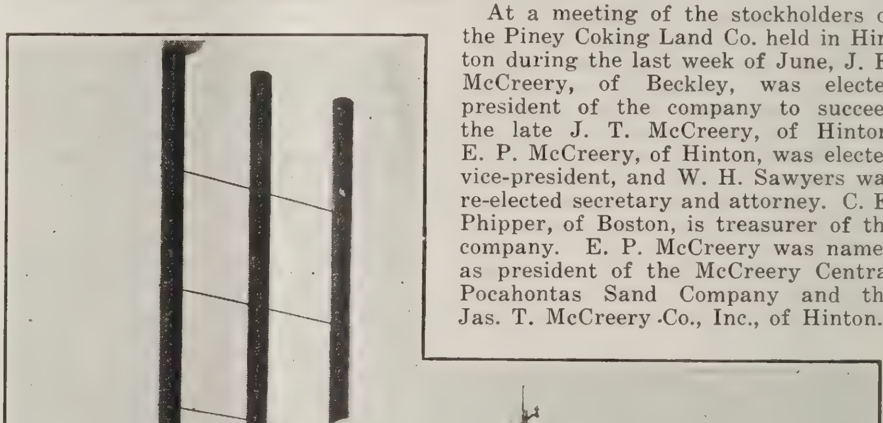
The girls' first-aid team of the Barrackville mine of the Bethlehem Mines Corporation won first place at the third annual inter-mines first-aid meet of the Bethlehem Mines Corporation in Harrisburg, Pa., June 27. The Barrackville mine-rescue team was third and the men's first-aid fourth. The girls' first-aid team of the Preston Division, with headquarters at Reedsville, was second.

The Paint Creek mines of the M. A. Hanna Co. as well as those at Boomer, W. Va., reopened the week of June 22 after inactivity for a period of over a year. These were closed when the Kanawha operators were refused a lower scale than the Jacksonville agreement and kept closed until all chance of a change of front on the part of the unionists was dissembled. They are now being operated on the open-shop plan.

Frank C. Shriver, of Morgantown, is the new president of the Chaplin Collieries Co., having been elected to the office at a meeting of the stockholders of the company held on June 27, to succeed J. L. Keener. Other officers elected at the same time include H. S. Hirshberger, of Pittsburgh, vice-president; P. A. Beaumont, of Morgantown, treasurer; J. S. Stewart, of Morgantown, secretary. The above officers together with the following now constitute the board of directors: Frank Orr, Leopold Sigwart, B. M. Chaplin, August Boehler and E. H. Stoner, the latter of Pittsburgh.

C. O. Strieby, of Elkins, attorney and trustee for the Deal Coal Co., sold the property of that company at court sale at Buckhannon on June 27. The property was sold to Ezra and Daniel Deal, of Cumberland, Md., principal creditors of the company, for $6,000. The purchase covers 143 acres of coal land about two miles from the city of Buckhannon. The mine has not been in operation for several years but the chances are that it will be leased as a result of the sale.

At a meeting of the stockholders of the Piney Coking Land Co. held in Hinton during the last week of June, J. E. McCreery, of Beckley, was elected president of the company to succeed the late J. T. McCreery, of Hinton. E. P. McCreery, of Hinton, was elected vice-president, and W. H. Sawyers was re-elected secretary and attorney. C. E. Phipper, of Boston, is treasurer of the company. E. P. McCreery was named as president of the McCreery Central Pocahontas Sand Company and the Jas. T. McCreery Co., Inc., of Hinton.



**West Kentucky Coal Co. Power Plant**

This plant, located at Earlington, Ky., is now tied in with the Kentucky Utilities Co. In January, 1925, this plant generated 1,300,000 kw.-hr., of which about 1,000,000 was sold to the power company.

Tipple at Frances Mine

Equipped to screen 350 tons of coal hourly, this tipple was in full operation, completely equipped, within three months from the start of the work of construction. The Frances operation is located at Franko, Marshall County, W. Va., about eight miles below Moundsville, on the Ohio River. The property consists of 1,671 acres underlaid with the Pittsburgh seam.

The property of the Sewell Valley Coal Co., at Beurytown or Secoma, has been sold to Donald Reinhold for a consideration of $150,000. The transfer covers 1,804 acres of coal land and all the mining property and equipment. A deed of trust for $150,000 on the same property has been given by the West Virginia Pocahontas Colliery Co., to the Huntington Banking & Trust Co., to cover an issue of bonds.

In giving figures covering fatal accidents in the mines of West Virginia during the month of May, the West Virginia Department of Mines has also given a list of the companies in West Virginia which are using rock dust or are preparing to use it. The list includes the Byrne Gas Coal Co., of Scottdale; Bethlehem Mines Corporation, Barrackville; Bethlehem Mines Corporation, Fairmont; Youngstown Sheet & Tube Co., Dehue; Island Creek Coal Co., Holden; Boone County Coal Corporation, Sharples; Boone County Coal Corporation, Blair; Raleigh-Wyoming Coal Co., Glen Rogers.

Cletus Harold Jenkins, vice-president of the Hutchinson Coal Co., Fairmont, has been named as a vice-president of the West Virginia Coal & Coke Co.

According to W. J. Harahan, president of the Chesapeake & Ohio R.R., the gross revenue of that road for May was $9,500,000, compared with $8,678,000 for May, 1924. "The main reason for this is that we handle non-union coal exclusively," Mr. Harahan said. "Due to the shutdown of union mines, the non-union mines are producing at a high rate. Seventy-seven per cent of our traffic is in coal. There is no indication of any interruption of work by non-union miners, and our coal movement will probably continue heavy throughout the year."

## WASHINGTON, D. C.

The Federal Trade Commission dismissed its complaint against the Boehmer Coal Co., of St. Louis, Mo., and the Victory Coal & Mining Co., of Duquoin, Ill. A stipulation as to the facts was entered into between the commission and the respondents. The Victory Coal & Mining Co. produces coal from its mine in the state of Illinois, which is marketed by the Boehmer Coal Co. The complaint alleged that respondent's use of the word "Victory Coal" misled the public to believe that their product was produced by a competing company.

## CANADA

Fire which broke out at 11 p.m., June 28, destroyed the buildings and other structures, except the company's offices, at the bankhead of the British Empire Steel Corporation's No. 11 colliery at Caledonia, N. S., where the miners are on strike. The origin of the fire is unknown. Further depredations, including incendiarism, looting and assaults, were reported on July 3.

As the result of a conference held in Toronto on June 26 between Sir Henry Thornton, president of the Canada National Rys., and representatives of the Ontario Government, the City of Toronto, the Board of Trade and the Canadian Manufacturers Association, Sir Henry has reconsidered his refusal to carry out the agreement entered into for the shipment of Alberta coal to Ontario at a rate of $7 per ton. The experimental shipment of 25,000 tons of coal at that rate will be undertaken as soon as possible. Accurate data will be kept of each item entering into the cost of the eastward haul as a basis for future calculations to fix a permanent rate. Any cost to the railway over and above the $7 freight charge will be met by the federal government, which has made an appropriation of $25,000 for that purpose.

With the recent vote by the Coalhurst (Alta.) miners indorsing the new wage agreement, in line with that adopted by the Galt miners, the whole Lethbridge domestic coal field is now working under a new wage schedule.

There was a slight decline in Canadian coke production during May the output amounting to 130,068 tons, produced from 199,235 tons of coal. More imported coal was used than in any previous month this year, owing to the difficulty of obtaining Canadian coal for the use of coke ovens in Eastern Canada. Foreign coal charged to coke ovens totaled 154,754 tons, while the use of domestic coal declined to 44,481 tons, as compared with 75,873 tons used in April. Imports of coke rose from 35,080 tons to 45,954 tons. As exports of coke increased only from 4,047 tons in April to 4,968 tons in May, the apparent consumption of coke in Canada was 174,054 tons, as compared with 162,517 tons available for use in April.

It is announced from Toronto that the Crows Nest Pass Coal Co., with the object of utilizing its coke, may make an effort to get into the iron and steel business. A dividend of 3 per cent has been declared by the company payable to shareholders of record May 12. Latest advices from the collieries of the company are to the effect that the company has been steadily working into a more favorable position. A daily output of 3,000 tons of coal has been maintained recently since the settlement of the labor difficulties and shipments have been practically uninterrupted since the resumption of operation.

# Traffic

## Roads Present New Schedule In Indiana Rate Fight

Another step in the controversy to adjust Indiana coal freight rates was taken June 29 when railroad representatives and coal carriers in the state presented a proposed new schedule of rates before attorneys and consumers and receivers of coal in the state. The purpose of the meeting was an attempt to make a compromise between the shippers and carriers in the coal-rate fight.

In presenting the new schedule the carriers will attempt to gain an increase on the rates now in effect on short hauls, which are those under fifty miles. It is not thought any decision will be reached without several meetings as the Evansville Chamber of Commerce, the Indiana State Chamber of Commerce, and coal users in Vincennes, Brazil and Terre Haute, and coal operators in those cities have organized to fight the adoption of such a schedule.

The present rates went into effect in August of last year after several hearings before the Indiana Public Service Commission. Since then a series of legal proceedings have been under way over the rate situation. Many of the larger coal consumers of Indiana say that if these proposed increases are put into effect it will mean they can buy coal cheaper from Kentucky, Illinois and West Virginia than from Indiana fields. If, after a series of conferences, no agreement is reached, the decision in the case will be given by the Interstate Commerce Commission, which several months ago recommended that the carriers and consumers attempt to settle the controversy.

**Rocky Mountain Coal Mining Institute.** Summer meeting, Aug. 26-29 at Price, Utah. Secretary, Benedict Shubart, Denver, Colo.

**American Institute of Mining and Metallurgical Engineers.** 132d meeting, at Salt Lake City, Utah, Aug. 31 to Sept. 3. Secretary, F. F. Sharpless, 29 West 39th St., New York City.

**Oklahoma Coal Operators' Association.** Annual meeting, Sept. 10 at McAlester, Okla. Secretary, A. C. Casey, McAlester, Okla.

**New York State Coal Merchants' Association.** Annual convention, Sept. 10-15, at Richfield Springs, N. Y. Executive Secretary, G. W. F. Woodside, Arkay Bldg., Albany, N. Y.

**National Safety Council.** Annual meeting Sept. 28 to Oct. 2, at Cleveland, Ohio. Managing Director, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

**Tenth Exposition of Chemical Industries,** Sept. 28 to Oct. 3, at Grand Central Palace, New York City.

**Canadian Institute of Mining and Metallurgy.** Annual western meeting Nov. 3-5, Winnipeg, Manitoba, Can. Secretary, George C. Mackenzie, Drummond Bldg., Montreal, Que., Can.

**Fourth National Exposition of Power and Mechanical Engineering, Nov. 30 to Dec. 5, at Grand Central Palace, New York City.**

**Coal Mining Institute of America.** Annual meeting, Dec. 9-11, Pittsburgh, Pa. Secretary, H. D. Mason, Jr., P. O. Box 604, Ebensburg, Pa.

# New Equipment

### Thermal Relay Is Added to Compensator Equipment

The General Electric, hand-starting compensators bearing the type designation CR-1034 have been redesigned. These compensators are for use on alternating-current circuits for starting squirrel-cage induction motors. Temperature overload relays have been incorporated in the compensator, replacing dashpot overload relays. In one of the sizes multiple rated auto-transformer coils are used instead of the single rated variety. The redesigned compensators also include an improved push button mcehanism, containing an attachment for resetting the temperature overload relays.

Closer overload protection is obtainable with the new type relay. The multiple rated auto-transformer coils, where used, permit the use of one compensator for several horsepower ratings for a given voltage. The incorporation of the relay resetting function in the push button simplifies the operation of the device, making it unnecessary to open the compensator for this purpose.

**Redesigned and Improved Starter**

With the new thermal relay incorporated in this compensator better overload protection is possible.

### Heater Keeps Sandpipe Dry

An electric sandpipe heater for use on electric mine locomotives to keep the lower end of the pipe dry and prevent clogging, lately has been placed on the market by the Universal Electric Sandpipe Heater Co., Philadelphia, Pa.

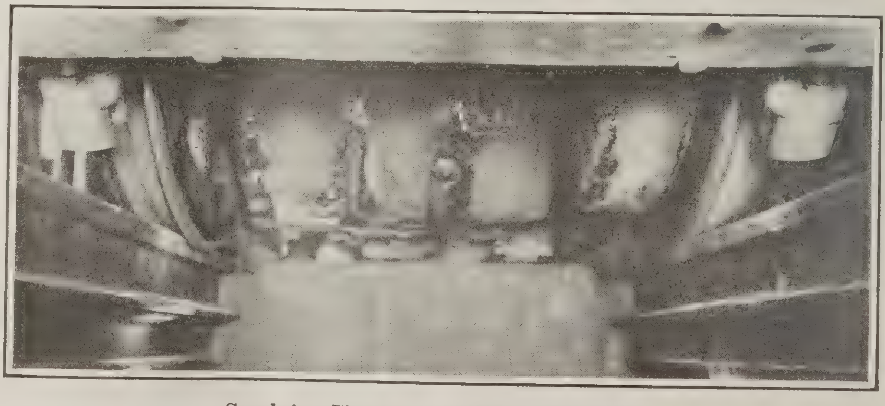
The device can be attached to the end of the sandpipe. A separate connection is provided for the conduit which carries the electric conductors leading to the heating element. With wet sand the end and interior of a sandpipe often get covered in such a manner that the outlet becomes closed. With this newly developed device the sand will always flow freely.

How the complete unit is installed on a mine locomotive is shown in the accompanying illustration. Inside the shell of the heater casting and around the lower end of the sandpipe is fitted the heating element. Nichrome wire inclosed in the housing but carefully insulated from a metallic tube forms the heating unit. For use on mine locomotives the voltage of the device is such that the units may be connected in series and take power directly from the trolley circuit.

## New Companies

**Banner Coal Co., Ltd.,** has been incorporated to develop and operate coal and other mines, with a capital of $60,000 and head office at Calgary, Alta., by Isaac Saunders, James P. Pearson, Wm. McKinnon and others.

**The Pittsburgh & Erie Coal Co.,** a Delaware corporation, has qualified to do business in Indiana, with a capital stock of $25,000 represented in the state. The agent for service of process in Indiana is H. Humphreys, Peoples Trust Co., Linton, Ind.



**Sandpipe Heaters on Mine Locomotive**

With devices such as these applied to the sandpipes of the locomotive, the sand always flows freely and reduces many accident hazards occasioned by clogged pipes.

## Would Avoid Suspension

TO THE MINE WORKERS' statement that the anthracite operators have planned a suspension that will enable them to sell a huge stock of coal that they are alleged to have accumulated, the operators replied through S. D. Warriner at the Atlantic City Scale Committee meeting saying that they were greatly concerned to avoid a suspension, that they sought for arbitration and were willing to operate their mines at the present scale after the lapse of the agreement until the arbitrators had given their decision on what the new wage agreement should be.

There is no question that the operators want peace, and that they are confident that they have the right on their side is shown by the fact that they are willing to accept arbitration. On the other hand the mine workers want a suspension. They want the public to demand a speedy opportunistic settlement that will be dictated by panic fear and so they refuse arbitration for reasons that have a hollow ring to them. A political settlement is what they desire. They know that the public will compel the operators to pay anything and everything that will result in the provision of coal for its household furnaces, and they overlook the fact that the people will, as ever, dictate a settlement and then by the simple expedient of buying a cheaper fuel, prevent the benefits of its terms from being experienced.

But they don't like arbitration. That is judicial, that concerns itself with the logic of circumstances and with that yardstick of fairness that the miners so volubly praise but fear to have applied. Just wait, they figure, till the public is panic sticken and we will make Warriner and his boys hand over their very hides to the union.

As a matter of fact what the operators are seeking is what the mine workers really need, for a rise in the cost of coal will drive anthracite out of the market, thus depriving the men of their jobs.

To illustrate this contention with an example from the bituminous field: The Jacksonville agreement was signed by men who never realized the force of the tide that was destined to sweep the union areas of the bituminous coal industry. It was a quiet pacific ocean on which the coal bark lay. The mine workers and even the operators felt they could trust themselves on those undisturbed waters. They little realized how the clouds gathering in non-union fields would sweep over that glassy sea and leave the mines useless wrecks. As Mr. Warriner in a manner pointed out: With a fair sky you may be disposed to laugh at the storm but if the storms are gathering the laugh is not wise.

The mine workers and the press of the anthracite region do not realize how already the anthracite mines are having the fight of their lives and that the hope of the industry will be swept away if the price of anthracite is raised. Nothing will help the bituminous fields and the oil men more than to have the miners turn on the operators and break down their defense against their common competitor.

Are the union miners seriously going to play again into the hands of the non-union operators? Are they ready once again to turn on the employers who are fighting their battle? The scale committee had a chance to discuss this matter with the men at home over Sunday. There was no meeting of the sub-scale committee from Friday till Tuesday. Let us hope that they made clear to the men back home how serious was the situation and how their hopes of a wage increase are vain or, if not vain, illusory and how the best plan is to sign up with the operators or leave the matter to arbitration.

However, perhaps the mine workers want another Jacksonville agreement to starve for and die for. Perhaps they delight to be martyrs to another folly. Perhaps they would prefer to see anthracite displaced by oil, gas, coke, power and bituminous coal. Perhaps they would like to see Government regulation. Here is their chance. Let them fight for the scale they have presented. They can have the martyrdom they prefer.

## Together or Alone?

NO ONE TODAY lives to himself alone, and associations of men in any one line of industry bring a sense of community interest that is necessary for the best results. Time was when the discussion of coal problems was bitterly sectional. Today coal men are realizing that the non-union and union operators have common difficulties and problems that will be best solved by composite judgment and will not find a solution in recrimination—we had almost written vituperation, for that was what was sometimes felt and expressed.

The National Coal Association has been headed by non-union and again by union men, now by easterners and again by mid-westerners and always with accord. It has been remarkable how the leadership has fallen into the control of varied interests year by year, by mutual consent and preference and how loyally has the rank and file followed its leader without any manner of sectional jealousy.

Who shall say that this work has not had its valuable result? There has been no attempt to find where the majority lay. Just now the non-union members of the East find themselves in the ascendant, but with a courtesy manifested not merely generally but universally, a man from the West, a union operator, has been selected as generalissimo for the coming year.

Banking is a competitive industry. The leaders in finance, nevertheless, meet in happy harmony, play golf together, visit each other's homes and hold common conferences. They have their rivalries but these do not menace the amenities of their mutual life.

Robert K. Cassatt, at the meeting of the National Coal Association, expressed the conviction of the banking interests in these days. He speaks in the first person as of an individual conviction but it is the consensus of banking opinion to which he gives utterance:

"In these days every industry must have a clearing house in the sense of a central organization. Investment bankers have such an association, as have all other important lines of activity with which I am familiar. And I have observed that the virility of an association and the degree in which it is supported by its members are excellent indications of the character and financial judgment of the men engaged in that industry."

Thus sectionalism, the worst evil of all the evils to which mankind is subjected, is destroyed. The best national interest is served by a patient following of the best minds of the industry as represented by its directorate. Year by year the leadership of the National Coal Association officials and the discussions of principles, such as marked the recent meeting at Chicago, will clarify the minds of the industry as to the needs of one and all and create a national harmony which the coal trade for many years lacked.

"Let me leave you," said Mr. Cassatt, "with . . . the suggestion that the proper vehicle through which to express many sound thoughts in the interest of your industry is the nation-wide organization of bituminous coal operators, the National Coal Association."

## Do Less and Have More?

IN GREAT BRITAIN miners' wages are too high to permit the coal industry of that country to ship coal to the Continent, so the mines are running irregularly and many are idle. In consequence the six-hour day is being advocated, in order that all may work. That will add to the cost and shut down more mines and make the mines that do work run more intermittently than ever. The miners seem to believe that, if they cannot succeed with one handicap, they might possibly do so if they loaded themselves with another.

The condition is quite like that in America. It is indeed "hands across the sea." Both the English and American miner believe that if your low output is preventing you from working, arrange to make it a little lower and your chances for steady work may be better; if wages are too high to permit the mines and factories to run, make them still higher and work less hours. The British miners have carried their follies a little further, perhaps, than ours. If that surmise be true, they are probably a little nearer a discovery that their hopes are fallacious. An *ignis fatuus* can be pursued just so far, and the further it is pursued the nearer the pursuer is to the ultimate enmiring. Perhaps we and our British cousins are near the point where we can begin to see matters as they are and begin all over again on a surer basis, ignoring the false lights that our imagination regarded as something that would guide to safety and happiness.

## Too Busy to Plan

OFFICIALS at coal mines are usually too busy to plan largely or well. Their duties hold them at home from year's end to year's end, and so long as a man sees nothing and hears nothing but what is to be seen and heard in his own environment he is not likely to grow fast. When an engineer or a salesman drifts in to see him, he tells the visitor he is too busy to talk, or he listens with a mind that drifts uneasily to the pile of letters and orders on his desk, to his telephone calls and to his unfinished and pressing labors which, for the nonce, must go unperformed. Thus harassed he is not the good listener and acute questioner that the opportunity for contact with the outside world should develop.

A better way of doing his work should not be lost to him because of his anxiety and impatience to get it done quickly in another way and one less economical and effective. One must not be too busy to think and to plan, or the company will be the loser. It may have a man or two less on the payroll, but in most plants many men could be saved if better systems were adopted.

## The Truth Might Help

THE New York *Evening Post* on July 11 said in a Washington dispatch: "As the result, only departmental experts who have a direct interest in coal have continued to study the problem, and their researches leave only one conclusion regarding the immediate situation.

"Nothing has been done either outside the industry or by the operators and miners themselves to break the 'vicious circle,' in the course of which each period of peace is followed by a period of mines closed by strikes, resulting in an artificial shortage and the public 'holding the bag.'"

S. D. Warriner on July 9, spokesman for the anthracite operators, at a conference called to make a new wage scale, said as follows:

"We wish to urge that provision be made at the outset against the possibility of a suspension on Sept. 1. Such joint action on our part would deserve public confidence. It can be accomplished by an agreement to the effect that if our respective committees are unable to agree upon any issues, such issues shall be referred to arbitration, upon the understanding that production shall be continued at the present wage scale until the arbitrators render an award.

"Let me say to you here and now that the operators are prepared to co-operate in any fair and practicable plan, not only to prevent a suspension next September, but to provide means to prevent suspensions in the future in order that public anxiety in this respect may be put at rest. This can be accomplished by a long-term agreement with provision for the adjustment of wage rates during that term so that wages may be conformed to changing economic conditions."

Surely a candid world will say that the anthracite operators are trying to meet the difficulty, as far as it is possible for them to meet it alone. "Nothing has been done" in their case does not mean that nothing has been attempted. We can only hope that the journalist quoted did not reflect with precision what he was told.

The same paper says later:

"Government officials are not inclined to participate again in arbitration, which would result in an increase in wages to anthracite mines, an adjustment that would come only after a period of strife during which coal prices would go soaring to the profit of the operators and at the expense of the consuming public."

We would say that the sentence suggests that the Government officials do not believe in an increase in wages but when they are placed on an arbitration board they would be compelled to grant such an advance by reason of a sinister pressure. If this statement is true it is a severe indictment of the arbitrament of Government officials.

# Miners Want Higher Pay Because of Labor Hazards

## They Forsake "Living Wage" Plea as Anthracite Parley Opens at Atlantic City—Operators Are Solidly Against Strike and Suggest Arbitration but Men Will Not Agree

**By R. Dawson Hall**
Engineering Editor, *Coal Age*,
New York City

**Two Principals of the Anthracite Negotiation**

S. D. Warriner (left), chairman of the Anthracite Operators' Conference, and John L. Lewis, international president of the United Mine Workers.

JUDGING by John L. Lewis' address at the open meeting of the scale committees of the anthracite operators and miners beginning negotiations for a new contract July 9 at the Hotel Traymore, Atlantic City, N. J., the emphasis of the United Mine Workers has been lifted from the demand for a "living wage" to a plea that the hazards of the coal industry have never been given due consideration in the fixing of a scale. The argument now is that the men at the mines have been paid for their services but not for their sacrifices. Mr. Lewis adroitly forgot the compensation which is paid to the injured in case of injury without death or to the victim's dependents in case death results. Only Andrew Mattey, president of District 7, and father of 18 children "now happily at work," pleaded that wages were inadequate for raising a family. This was the only reference to the point in the two days' sessions which opened the negotiations.

During the two days of general statements by both sides the operators persistently declared there should be no strike Sept. 1 and that such differences as may exist between operators and miners by that date should be arbitrated while coal production continues. They held for wage reduction or a material increase in the productivity of miners because prices to anthracite consumers cannot be raised without jeopardizing the whole industry for men and mine owners alike. The miners, of course, contended for wage increases and opposed arbitration. However, only a bare beginning has been made in the negotiations. An open session was held July 9 and a preliminary meeting of the subscale committee took place July 10 when adjournment was taken to July 14.

At the opening general session S. D. Warriner, president of the Lehigh Coal & Navigation Co. and chairman of the Anthracite operators' conference read the operators' first statement, printed in full on another page. He wisely sized up the situation, pointing out that the miners and operators are facing a crisis. The miners might haggle about what they termed justice and get a scale that represented what they demanded as their rights, only to impose them on the operators without managing to make the public accept their high-priced coal. In that case they would have a high scale but no jobs. Mr. Warriner made clear that the demands could not be granted, for they would destroy an industry already in jeopardy.

At the meeting sixty to seventy were present. The mine workers had thirty to forty of these. The meeting was opened by James Gorman. At the proposal of President Lewis of the miners, Judge Frank W. Wheaton, chairman of the board of directors, of the Lehigh Valley Coal Co., was elected presiding officer, Mr. Gorman then being made secretary.

Mr. Lewis was requested to present the claims of the mine workers, which he proceeded to do in a most eloquent manner. He said that these claims were always promulgated as "demands." Really they were not in any literal sense either demands or requests for consideration. In truth they were something less than demands but something more than requests. Contrary to the general belief the union officials were not doing the thinking for the men in the mines. They merely voiced the demands of the mine workers which were based on the bitter experiences of actual work. There was no need for either a learned mind nor a facile hand to lay down what they wanted. The union leader was only the attorney employed by them to present the case which they themselves had laid before him. It was impossible for them to get in touch with the leading minds among the anthracite operators, and Mr. Lewis said that it was necessary, therefore, to make that presentation of their case by and through their union.

He then read the demands which have been published at length in *Coal Age*. With tragic eloquence Mr. Lewis declared that it was a greatly moving thought that, since he had appeared before the operators two years ago to appeal for an increased wage, 1,000 of his people had been killed and 40,000 maimed and injured "in your mines." "Every man present," said he, "recognizes the exactions of the industry." The operators may advocate arbitration, but he did not recognize the right of any commission to decide coldly for his people what they should get for their lives or for a broken back. The professions do not permit a commission to decide what shall be paid for their services and why should a commission be allowed to fix a wage for men who were preparing to risk their lives in a most hazardous occupation?

He said it is true miners take their cases to courts but not to determine principles like the reward for undertaking hazards. Courts, in the main, merely interpret contracts. Mine workers believe in such interpretation, but not in determining what pay should be awarded to those who place their lives in jeopardy.

Mr. Lewis declared he could not see why the operators should oppose an equalization of rates between the various mines when the duties performed were precisely the same in each. He was even more emphatic in calling for what he termed the recognition of the United Mine Workers, but which now means solely the imposition of the check-off. Already the anthracite companies made check-offs for twenty-nine different purposes; why not add a thirtieth? Why should not the union participate with the operators in this instrument of collection? Were they alone to be denied?

The check-off would not be costly to the operator for he had the machinery in operation already, nor would it add to the cost of the coal and be an added burden on the consumer. Why deny to the employee that to which the employer believed that he, himself, was entitled? It could not be regarded as a violation of the law, for the Union did not demand that the check-off should be imposed on any employee without his signed authorization.

The check-off, he said, was not designed to strengthen the union. It did not need such support; it was too well established for that; but it did desire to save the costs of collection of union dues, the scores of thousands of letters, the communications between the secretaries and an immense number of men scattered in many directions. Men failed to pay dues, not from lack of desire but for inattention to detail. In every club could be seen posted the names of men who were delinquent in the payment of their dues, not from intention or from the lack of the wherewithal to pay them, but simply because they had allowed this small matter to slip their attention.

Rinaldo Cappelini, president of District No. 1, and Christ Golden, president of District No. 9, then followed. To Mr. Golden it appeared that the check-off would head off wildcat strikes and be a benefit to the operator. A grievance which particularly troubled the men in his district was that nothing had been done to promote uniformity of scale. The operators had promised to give it consideration. But two years had nearly passed, and nothing had been done. Were they to be patient and wait forever? The members of the carpenters' union and the members of the United Mine Workers labored together at carpentry work, the former receiving $1.12½ per hour and the latter from 75c. to 80c. He could not conceive that, measured by the yard stick of justice and fairness this difference in scale was justifiable.

Thomas Kennedy, secretary-treasurer of the United Mine Workers, said the check-off had received legislative approval. The operators by law were checking off taxation on their payrolls. Was it right that the United Mine Workers should be the only institution prevented from using the check-off? Mr. Kennedy supported Mr. Golden in his statement that it was wrong that two men working side by side at the same job should receive wages varying by 30c. per hour. To him also it seemed unjust that the operators who were receiving pay by the ton of 2,240 lb. should not also pay their men by that tonnage. The demands of the union as ultimately formulated represented a composite aggregation of over 1,000 resolutions presented at the Tri-district Convention. They were not the demands of the officials, they were the individual behests of the men on the job.

**Operators' Representatives at Anthracite Wage Parley**

Members of the sub-scale committee which is in conference with United Mine Workers' officials at Atlantic City. They are, reading from left to right, front row: J. B. Warriner, E. H. Suender, Thomas Thomas, Andrew Fine; standing: W. W. Inglis and Geo. B. Hadesty.

Andrew Mattey, president of District No. 7, called on the union officials and the operators to effect an agreement. Amid much laughter at his witty thrusts he called on those present to complete their own job and not to let Pinchot and Coolidge "scab on them." He tauntingly complained that certain operators, whom he would not shame by naming them, were actually buying coal for their own operations and neglecting their own.

At this point Mr. Warriner read the operators' statement declaring for lower wages or higher efficiency by miners, and against a suspension.

Mr. Lewis desired to debate Mr. Warriner's statements, but the chair had already ruled that there should be no debate after each party had in turn presented its case, and at Mr. Warriner's suggestion the presentation of claims was brought to a close.

The meeting voted that the operators appoint six members of a sub-scale committee and the miners an equal delegation to consider the question further and report to the scale committee. With this resolution the scale committee adjourned. The operators' representatives had already been elected at the meeting of the operators the prevous day. They are W. W. Inglis, president of the Glen Alden Coal Co., of Scranton, chairman; Andrew M. Fine, vice-president, Hudson

Coal Co.; Thomas Thomas, general manager, Lehigh Valley Coal Co.; Jesse B. Warriner, general manager, Lehigh Coal & Navigation Co.; E. D. Suender, general superintendent, Madeira-Hill Co.; and George Hadesty, general manager, Philadelphia & Reading Coal & Iron Co. Mr. Inglis was nominated by Frank H. Hemelright, chairman of the Conference Labor Committee, who had declined to serve, despite the pleas of his associates.

The union men hardly need naming as they are so clearly indicated by their standing in the organization; Rinaldo Cappelini, president, District No. 1; Andrew Mattey, president, District No. 7; Christ Golden, president, District No. 9; John L. Lewis, Philip Murray and Thomas J. Kennedy, president, vice-president, and secretary respectively of the international union.

James F. Dewey, commissioner of conciliation, U. S. Bureau of Labor, was at the meeting representing the Federal government, and David Williams, director of industrial relations of the Commonwealth of Pennsylvania, represented Governor Pinchot of that state. J. J. Walsh, another of Governor Pinchot's representatives, did not arrive in time for the meeting.

The operators' sub-scale representatives met on the morning of July 10 and in the afternoon the whole sub-scale committee had a session. Little definite progress was made at this first executive meeting beyond a preliminary discussion of market competition from anthracite substitutes. The committee chose Alvan Markle of the Jeddo-Highland Coal Co. as its joint chairman. Before adjourning for the week, it scheduled its second section for July 14 at 2 p.m. in the Traymore.

The operators went into the July 10 executive session holding strongly to their keynote, which is: "Let there be no strike." This position was restated for the operators by Mr. Warriner in the following public statement:

"We are reported to be indifferent to, if not actually in favor of, a suspension in order that we may dispose of large stocks of coal. On the contrary, our representatives have been instructed to urge upon the miners' committee the proposal that whatever may be the course of negotiations for a new contract both sides shall bind themselves that there shall be no suspension of production.

"The operators wish to have it clearly understood that they are opposed to a suspension under any circumstances. Because the parties in any dispute cannot agree by a given date is no reason why they should go to war. In this belief we are pressing the proposal that if our respective committees are unable to agree upon any issues, such issues shall be referred to impartial arbitration, upon the understanding that production shall be continued at the present wage scale until the arbitrators render an award."

The miners were expected to continue their implacable opposition to arbitration on two grounds. They fear the entrance of a third agency in the dispute on the ground that an "outsider" would practically be able to dictate the miners' mode of living. They are also said to fear that acceptance of the proposal might nullify progress in the subcommittee sessions, with the operators rejecting every demand until Sept. 1, at which time every issue would go automatically to arbitration.

## John Lewis Counters

President Lewis of the miners made a reply to the operators' statement thus:

"Statements made by anthracite operators that anthracite mine workers earn high incomes are not borne out by the facts. The United States Coal Commission spent an entire year and $600,000 of the people's money in making an investigation of the coal industry. In its report to Congress the commission said that out of a total of 45,678 outside day men employed at the anthracite mines 43,822 earned less than $2,000 a year, and only 1,856 earned more than $2,000.

**Principal Representatives of the Anthracite Miners at the Atlantic City Conference**

These officers of the United Mine Workers, reading from left to right, are: Andrew Mattey, president, District 7; James L. McAndrew, secretary, District 9; Thomas Kennedy, international secretary-treasurer; Christ Golden, president, District 9; John L. Lewis, international president; Philip Murray, international vice-president; Rinaldo Cappelini, president, District 1, and Enoch Williams, secretary, District 1.

"Approximately 22,000 earned less than $1,000. The men that earned between $1,000 and $2,000 had to work from 251 to 396 days in the year. The 1,856 men who earned more than $2,000 had to work from 292 to 470 days. And there are only 308 work days in the year.

"These are not the figures of the United Mine Workers of America. They are the official figures of the United States Government, and we must accept them as being true. To earn $1,000 a year, or $83 a month, a man had to work 292 days. To earn $2,000 a year, or $166 a month, a man had to work every day, including every Sunday and every holiday and 105 days of overtime. Where is the American citizen who, after reading these figures, will say that these workingmen should not have more equitable wages and a better opportunity to earn a living for themselves and their families?"

## But Is Mr. Lewis Correct?

Mr. Lewis' figures are based upon the report on "Earnings of Anthracite Miners," prepared by Anne Bezanson, but not issued as a formal Commission report. The 22,000 men mentioned by Mr. Lewis as earning less than $1,000 per annum include a very large number working less than half a year; in fact, the maximum average number of days worked in this classification was 228. Obviously, therefore, the statistics cover names that appeared on the payrolls of several collieries and, to that extent, represent duplications. Nearly 23 per cent of the 22,000 earning less than $1,000 per annum averaged less than 10 days; 3,286 of the 22,000 averaged 35 days and earned between $100 and $200 for that work.

The report on actual wage rates paid in the hard coal field, prepared by W. E. Fisher, showed that the company men were paid from 21 to 71c. per hour. Approximately 88 per cent of the number received between 51 and 71c. Of the 10 per cent receiving less than 51c., a little over three-fourths were boys. In both the Fisher and Bezanson reports, the wage rates and earnings given are those in effect prior to the 10 per cent increase awarded by Governor Pinchot in September, 1923.

### Lewis' Paints Colorful Picture

The apparently high accident rate dramatized by Mr. Lewis the first day of the joint conference is due, not to the extra-hazardous nature of anthracite mining, declare the operators, but to the thoroughness and the detail with which accident statistics relating to hard coal mining are kept. The Lewis picture of the anthracite region "as a shambles where yearly 20,000 men—400 a week—are carried out of the mines on stretchers," was characterized as "too highly colored to be taken seriously. . . . The stress now placed on the hazards of the employment as a reason for the wage increase suggests that this argument is resorted to because it is realized that comparison will show that anthracite workers' earnings are all really above those of other industries and that some other argument than the inadequacy of earnings must be found."

"If, as has been stated by the miners' representatives, 20,500 men are killed and 'maimed' yearly, the entire working force would have to be replaced every seven years—an obvious absurdity," adds the statement.

"Perhaps one-third of the anthracite mine accidents are compensatable—that is to say, serious enough to require that compensation be paid. The remainder include a scratch on the finger or a speck of coal dust in a man's eye. Every accident, however trivial, is investigated by company doctors and reported. That is the main reason for the large total.

"According to government experts, there are twenty more dangerous employments than anthracite mining, which is surrounded by every possible safeguard.

"There are 42,500,000 man days of work a year in the anthracite industry. Figuring that there are 6,500 serious accidents per year, it is apparent that a man takes the risk of being injured once in 6,545 days, or about twenty-four working years."

## Water Gas Can Now Be Made from Ordinary Midwest Coals

In Technical Paper 335, just issued by the Bureau of Mines, summarizing the results of work performed under a co-operative agreement between the Bureau, the Illinois State Geological Survey, and the Engineering Experiment Station of the University of Illinois, William A. Dunkley, an illuminating gas engineer, Department of the Interior, states that by the use of properly designed equipment the low-sulphur coals of the Middle West, not ordinarily regarded as first-grade fuels for gas or coke manufacture, can be made to give almost as good results in the generation of water gas as can be obtained from the more expensive high-volatile Eastern coals.

The extensive use of Illinois, Indiana, and other Midwestern coal in gas manufacture in place of coke from Eastern coals is important in that it would release an appreciable amount of coke for use in other industries. Furthermore, transportation of coal from Eastern fields would be avoided.

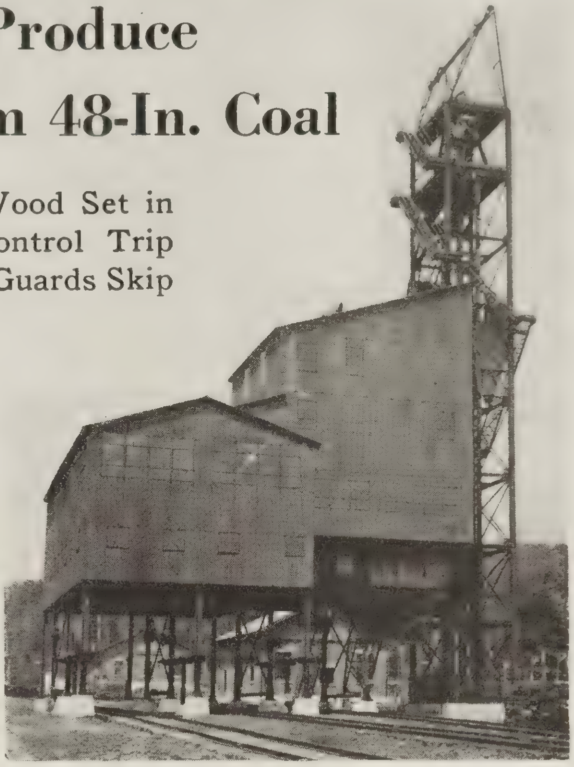
Under certain conditions of the fuel market the prices of coke and anthracite—the fuels commonly used in water gas manufacture—differ radically from those of bituminous coal. Such differences were marked during the World War especially throughout the Middle West. This stimulated the study of methods whereby bituminous coal might be used for making water gas. During the early attempts in this direction trouble was experienced. Although mechanical difficulties caused some annoyance, decreased production capacity and low fuel efficiency were even more discouraging.

After extensive experiments, however, operating methods gradually were improved and other difficulties were almost entirely overcome. Fuel consumption per unit of gas produced also was cut down, especially in the smaller sets, to such a point as to bring bituminous coal almost onto a par with low-volatile fuels, even at the same price per ton. The larger sized water-gas sets gave more trouble and the difficulties here encountered, as yet have not been entirely surmounted.

Market conditions are not now as favorable to the use of bituminous coal as they were formerly; nevertheless, it is still employed in several plants. Under certain conditions it effects marked savings in operating costs. The ability to utilize this material, unquestionably increases the flexibility of a water-gas plant under varying conditions of fuel supply.

# Kramer Mine Is Built to Produce 4,000 Tons a Day from 48-In. Coal

## Six-ton Skips Run in Guides of Wood Set in Steel Channels—Push Buttons Control Trip Feeder and Dump—Signal System Guards Skip



**By Alphonse F. Brosky**
Assitant Editor, *Coal Age*
Pittsburgh, Pa.

A NUMBER of uncommon features of design and construction of the shaft and tipple equipment are employed at the Kramer or No. 60 mine of the Northwestern Mining & Exchange Co., ten miles south of Du Bois, Jefferson County, Pa., on the Buffalo, Rochester & Pittsburgh R.R. Here, the coal being mined lies at a depth of about 300 ft., which, for a predetermined daily output of 4,000 tons in 8 hr., made advisable the installation of twin skips, fed by overturning two mine cars at a time in a rotary dump.

A dual signal system of electric lamps and gongs, within sight and hearing of the hoist operative and the skip attendant at the bottom landing, unifies two-man control of the loading and hoisting of the skips. Worthy of particular mention also is the fact that the auxiliary shaft is equipped with hoist, rope and sheaves which are duplicates of those provided for the main shaft.

The Kramer mine property consists of 2,700 acres of 42- to 48-in. Lower Freeport or "D" measure coal. The output of this mine is used as railroad fuel. When this operation reaches its maximum production, in addition to being the largest in its field, it will be registered near the top of the list of leading producers of Pennsylvania bituminous coal. It may become the largest low-seam, shaft, coal mine in the country. Because of that and because of the engineering involved in its construction and operation its features are of interest to the whole industry.

### THREE SHAFTS PROVIDED

This mine is gassy and therefore requires—and receives—the greatest possible degree of protection by method and equipment. At the same time its hoisting capacity is kept high. It is not so surprising, considering these requirements, that the Kramer mine is provided with three shafts: One for hoisting coal, the second for handling men, mine refuse and supplies and the third for ventilation purposes.

The coal hoisting shaft is 280 ft. deep to the bottom of the coal, below which is a 54-ft. pit for the car-dumping and skip-loading machinery. In the construction of the below-coal part of this shaft, 464 cu.yd. of concrete was poured. This indicates the size and massiveness of the pit.

The shaft measures 8 x 32 ft. inside and is equipped with twin 6-ton skips of the Lepley bottom-discharge type. The auxiliary shaft is 300 ft. deep, with inside dimensions of 12 x 20 ft., and is provided with two solid-car, self-dumping cages. A 6-in. partition divides the 12 x 18-ft. air and escape shaft into a 12 x 12-ft. airway and a 5½ x 12-ft. stairway. The concrete linings of all three shafts, which to solid rock are 2 ft. thick and from that point to the bottom are 1 ft. thick, are reinforced on 1-ft. centers vertically and on 2-ft. centers horizontally by ¾-in. twisted iron rods.

The construction of the skip shaft guides aids in maintaining their accuracy of alignment. The buntons, which are of 8 x 10-in. oak, are anchored at vertical intervals of 5 ft. by cast iron brackets set in the concrete lining. To these are bolted channels in 20-ft. sections, which receive and hold rigidly in place 7¾ x 10-in. guides of yellow pine.

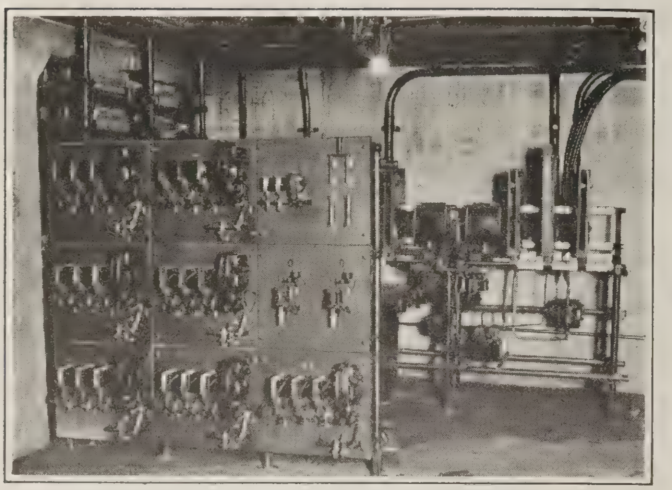
Coal is hauled to the skip-shaft bottom in trips of 35 to 40 two-ton mine cars which are delivered by a trip feeder to a two-car, tandem, rotary dump. The mine cars are equipped with swivel couplings which allow them to be dumped without uncoupling. The approach to as well as the run-off from the rotary dump is on a 1½-per cent grade in favor of the mine cars to avoid delays in dumping so that, even though the trip feeder should get out of order, mine cars can be handled to the dump, of course at slower speed.

The trip-feeder and the rotary dump are interconnected electrically so that a single starting push button operated by the dump attendant controls the normal movements of both. Pushing of the button puts the feeder in motion advancing the trip to the dump, a distance equivalent to the length of two mine cars, after which the feeder and the trip stop. Then the rotary dump automatically turns over and rights itself, completing a dumping cycle. Power is applied through only three-quarters of the dumping angle and after a brief pause, is reversed, causing the dump to return to its starting position at which it is positively locked.

The arrangement is such that the dump will not operate unless the mine cars on it are exactly spotted.

---

The headpiece shows the tipple and hoist houses at Kramer mine. When the headframe extends high above the roof of the tipple at a mine plant, as in this picture, one may be sure that coal is hoisted by skips. Large window bays admit ample light for efficient work on the picking tables.



**Contactor Room in Basement of Hoist House**

Good practice nowadays is to keep all or as much as possible of the noise out of the hoist room by putting the switching equipment and contactors in the basement. This is not a new idea by any means; it is being followed at many a mine.

Another emergency provision is a second push button which enables the operative to stop either the trip-feeder or the dump at any stage in its cycle. The speed of dumping and feeding are fixed to handle a trip at the rate of 6⅔ cars a minute. A third push button is provided which causes the dump to reverse to its normal position, if desired, after it is stopped; but ordinarily the entire cycle is completed without attention from the operative except a push on the starting button to begin and to end the cycle.

### Reduces Degradation

The coal, upon leaving the mine cars in the rotary dump, is guided by chutes to a pair of electrically operated rotary weigh pans. This type of weigh pan slides the coal gently and with only a slight fall to the chutes which carry it to the storage bin. Thus degradation is reduced to a minimum. None of the coal can lodge in the pan—a fault of many weigh pan installations which forces the owner to pay over and over again for a given weight of coal.

From the weigh pans the coal is directed by chutes to a 10-ton storage bin. Air-operated, undercut gates open and close the passages between the storage bin and 6-ton measuring pockets flanking the respective skips. Between each measuring pocket and its mated skip, when the skip is at the bottom landing, is a loading chute. These chutes are hinged to the lower ends of the measuring pockets. They retain a skip-load of coal in each pocket when they are up and, when opened they permit the flow of coal to the skips without spillage. The undercut gates and the loading chutes are actuated by individual air engines.

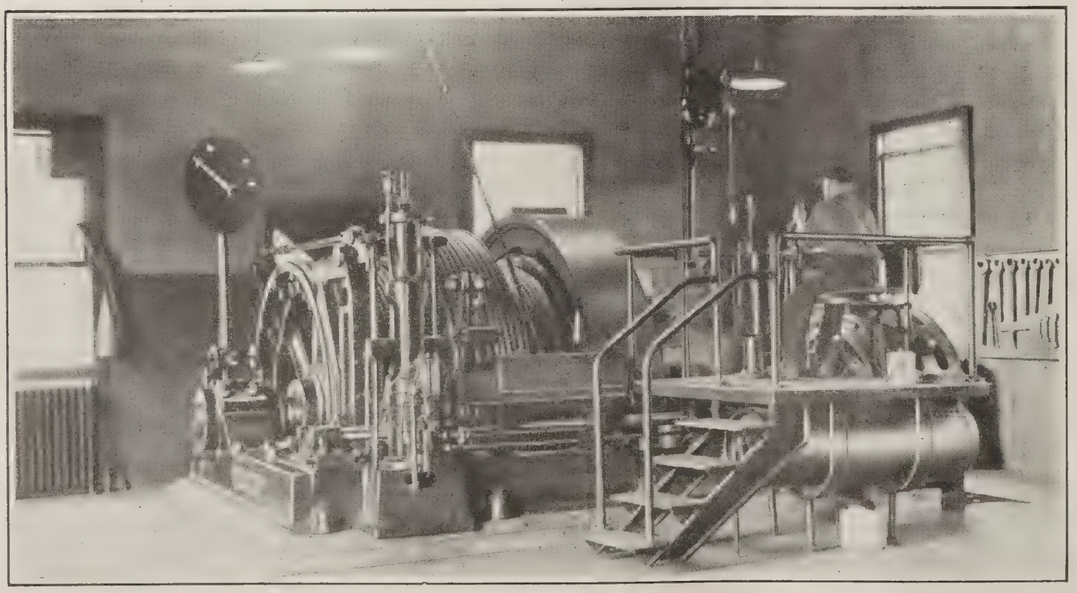
By an interlock mechanism which prevents mismoves and the signal system of gong and lamps, the skips are loaded, hoisted and dumped with precision. A manually operated lever controls the air valves which open and close the undercut gates. These gates are locked against movement when the skips are in their loading position at the bottom landing. If, after opening an undercut gate to fill one of the measuring pockets, the operative fails to close the gate, that skip with which the particular pocket is mated will close automatically and lock the gate against movement upon its approach to the bottom landing. The loading chutes are actuated by air valves which, likewise, are locked when the skips are away from their loading position.

### Arrangement of Signal Boards

On the hoist platform and in view of the operative is a signal board on which is mounted a gong between two lamps in a vertical row. A similarly arranged board is provided at the bottom for the skip-loading attendant. The two upper lamps, one on each board, are in a single circuit which is opened and closed by a switch simultaneously with the closing and opening of the air line to the undercut gates and loading chutes. When the air line closes, these lamps burn and when it opens they go out.

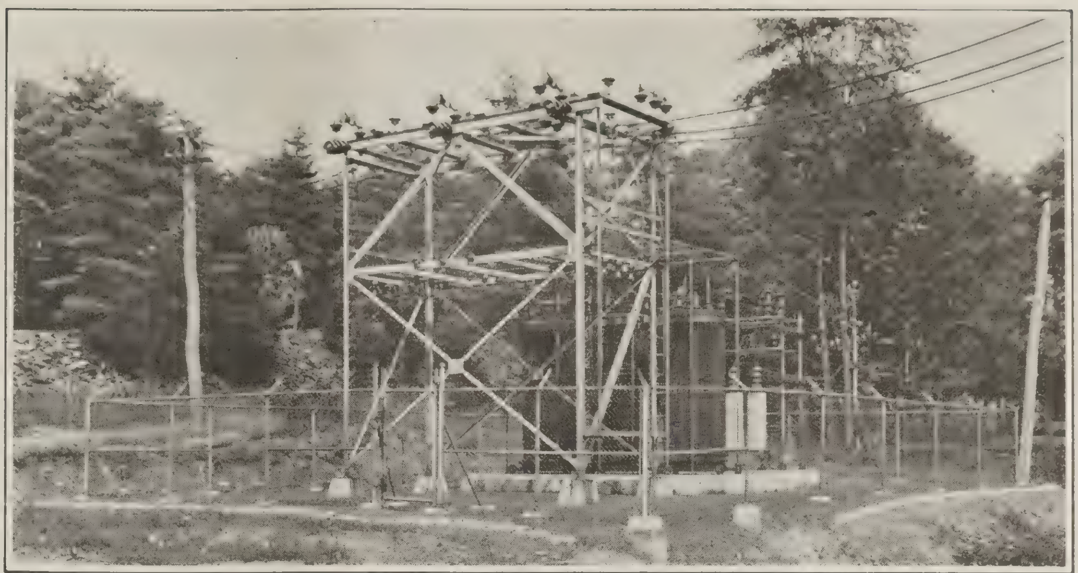
The gong and lower lamp on each of the two boards are connected in a single circuit by a skip-operated switch and a push button at the bottom. By means of this arrangement the hoist operative knows when to hoist and the skip attendant at the bottom can tell whether the loading chutes are open or closed.

When the chutes are open the switch is open and a signal to hoist cannot be given; but when the chutes are closed the switch is closed and the skip attendant notifies the hoist operative by pressing the push button. The closing of the circuit in this manner rings the gong and lights the lower lamp simultaneously at each of the two stations. The signal board at the bottom



**Hoist at Auxiliary Shaft**

This 400-hp. hoist is a duplicate of the one which raises and lowers the skips in the main shaft. It is equipped with all those safety devices which today make hoisting a comparatively uneventful job around the mine.



**Transformer Station**

These three 667-kva. transformers at Kramer mine step down current coming in at 33,000 volts to 2,300 volts. Power is transmitted to this mine from Helen Mills, Elk County, 34 miles away where the company operates a 4,500-kw. power plant.

of the shaft is also provided with two lamps which indicate whether the undercut gates are open or closed.

The two skips, which are hung in balance, discharge into a 25-ton storage bin on the tipple. The headframe over the coal-hoisting shaft is of all-steel construction, as is also that over the auxiliary shaft.

Except for the use of self-dumping cages in the auxiliary hoisting shaft as against skips in the main shaft, the auxiliary hoisting equipment is the same in both shafts. The duplicate hoists are driven by 400-hp. induction motors at a rope speed of 900 ft. per minute in a 43-sec. cycle. The drums are of the cylindro-conical type with 7- and 9-ft. diameters. Lang lay ropes of 1½-in. diameter are used for hoisting in each of the shafts.

The headframes are equipped with 10-ft., bicycle-type sheaves on self-oiling bearings of the Lepley type. These bearings will not freeze in the winter. They are lubricated by floating splash rings, a system of lubrication frequently applied to big electric motors. Take-up screws are provided for aligning the sheaves.

The advisability of equipping both shafts with duplicate hoists might be questioned. The Northwestern Mining & Exchange Co. has done this to enable it to handle a 6-ton locomotive on the cages of the secondary shaft, to provide a high safety factor in the equipment at this shaft where men must be hoisted and also to minimize the number of repair parts which must be kept on hand. Another reason is that all rock is hoisted from the secondary shaft to a 25-ton bin from which it is disposed by a 10-ton electric larry. The arrangement allows uninterrupted flow of coal to the tipple removing those complications which arise where coal and rock are handled alternately by the same equipment. Cars of rock in a trip are passed through the rotary dump without being overturned and later are hauled to the auxiliary shaft.

### WELL-LIGHTED TIPPLE

Galvanized sheeting of acid-resisting iron covers the sides and roof of the tipple which is lighted by steel-sash windows on the sides and by skylights on the roof above the picking room. One of the skylights can be raised to assist in ventilation for the comfort of pickers on hot days. Three sides of the picking room are lighted by a continuous panel of windows, making the place as light as a modern factory.

The tipple has a capacity of 600 tons an hour, loading on three tracks. Its equipment is designed to handle coal having the following percentages of sizes: Lump, 55 per cent; nut, 20 per cent, and slack, 25 per cent. Nut coal is loaded separately. However, the equipment can be regulated to load lump-and-slack, lump, picked run-of-mine, and lump-and-nut over either No. 1 or No. 2 track or both. On No. 3 track may be loaded nut-and-slack, nut, slack or emergency run-of-mine. The latter is chuted directly from the skip storage bin to this track without passing over the screens and picking tables.

Prepared run-of-mine is picked by sizes and later joined in passing to railroad cars. The smaller sizes are delivered to the loading chutes in advance of the lump so as to keep breakage at a minimum.

### UNCOMMON SHAKING SCREENS USED

Several features of the shaking screen are uncommon. The rig is made in two decks, the upper of which is provided with three screen areas and the lower with but one. In the first screen area of the upper deck are 2-in. square openings through which the undersizes are separated from the lump. The two lower screen areas on the upper deck separate the lump into two sizes, over and under 3-in.

This size separation of lump is effected to obtain a better separation of refuse on the lump picking table. This table is of the circular type, as is also the nut picking table. One size of lump is directed to the inside and the other to the outside annular zone of the lump picking table.

To eliminate vibration in the tipple structure the screen, which of necessity must be heavy to handle 4,000 tons in 8 hr., is built up in sections that are balanced against each other in driving. Each section is supported from the building structure by hanger rods at each end of which are removable cast iron bearing blocks. This method of support prolongs the life of equipment and effects a saving in power by avoiding excessive flange friction due to binding in roller-mounted screen rigs.

The trip-feeder, rotary dump, rotary weigh pans and the tipple were furnished by Heyl & Patterson, Inc., Pittsburgh, Pa., while the skips and skip-loading equipment were furnished by the Connellsville Mfg. & Mine Supply Co., Connellsville, Pa.

# Rock-Dust Tamped, Air-Cushioned Shots Increase Yield of Lump Coal in Experiments

## Tests by Maryland Experts Prove Also that They Reduce Consumption of Explosive and Suppress Flame Smoke and Fumes—Should Win Men's Favor

**By Dr. J. J. Rutledge**
Chief Engineer, Maryland Bureau of Mines,
Baltimore, Md.

Dr. J. J. Rutledge

IT APPEARS to be the general practice in mines to use more explosive than is necessary to bring down the coal. It is a common adage of the miner that "it is easier to pick the coal up than to pick it down." Again, powder and all other blasting supplies formerly cost much more than they do today. The present tendency, therefore, is for the miner to use them more lavishly. This results in a shattering of the coal and a reduction in the percentage of lump produced.

Binders in the coal also exert an influence. An explosive of a certain strength may be adequate to bring down coal but a much stronger one may be required successfully to disrupt a binder interstratified in the bed. At present an urgent demand for lump coal is in evidence; small coal is not wanted.

These facts render it apparent that some means must be found for reducing the size of the charge employed, decreasing the violence of the explosion or spreading the action of the explosive over a larger area of the coal. As a rule, only the second alternative is possible of adoption. The explosive force can be most readily limited by means of an air chamber within the shot hole. This also accomplishes a uniform distribution of the explosive force along a greater length of the hole than that occupied by the charge.

Use of air chambers is not entirely new. Many old miners, especially in brushing, formerly used mud balls in their tamping material in order to get a small air space. Application of the air chamber as here considered, however, had its inception in an article entitled "A New Way to Increase Lump Coal Production," by Dr. Alfred Stettbacher, of Zurich, Switzerland, published in the September, 1923, issue of the *Explosives Engineer*. This article described the use of rock-dust stemming in the coal mines of the Ruhr district of Germany since the war. The claim was made that the proportion of lump coal was increased as much as 50 per cent, accompanied by a decrease in the consumption of explosives amounting to from 20 to 40 per cent. In this country J. H. Horlick, Jr., of the Hercules Powder Co., Capt. W. J. German, of the Du Pont Co., and J. E. Tiffany and C. W. Nelson co-operating with the Carnegie Institute of Technology and the U. S. Bureau of Mines have performed and reported much valuable investigative work on cushioned blasting.

This subject was brought to my attention in October, 1924, by Clarence R. Claghorn, a consulting engineer of Baltimore. The law of Maryland requires the state Bureau of Mines to assist operators in improving their methods of mining and in increasing the recovery of coal. In compliance with the statutory provision, John B. Watkins, one of the district mine inspectors, was detailed to assist Mr. Claghorn in demonstrating the effectiveness of air-chamber blasting as well as that of rock-dust stemming. Some of the results of their work are here set forth.

Although the results of some of the tests conducted were not all that might have been desired, two outstanding benefits were noticeable. The first and most important was the fact that use of the air chamber decreases by from 20 to 50 per cent the amount of black powder necessary to bring down the coal; second, little powder smoke resulted from blasting when air chambers were employed.

Pasteboard tubes served as air chambers. These varied in length from 8 to 12 in. and from 1¼ in. to slightly over 1½ in. in diameter. They were waterproofed and fitted with caps at either end. When properly filled with limestone dust, 78 per cent of which would pass a 200-mesh screen, one 12-in. tube held 1 lb. Black FFFF blasting powder was the explosive used in most of the trials.

In accordance with Mr. Claghorn's suggestion that the advantages of rock-dust stemming be tested in conjunction with air-chamber blasting, a number of 12-in. tubes were filled with rock dust and used as part of the stemming in the drill hole. It was thought that detonation of the explosive would scatter this dust over the gob thus masking any coal dust present. It was believed that by this means the working faces practically would be rock dusted in somewhat the same manner that the gobs in the mines at Hanaford, Ark., are sprinkled with salt through the use of "dummies" filled with this material.

Experiments were conducted in a few of the mines of the Georges Creek and Upper Potomac regions of western Maryland during the fall of 1924. The coals here found are generally much softer than those of Illinois, Indiana, Ohio and other states and, consequently, the miners use their picks freely if the coal has not been machine undercut. Furthermore, such

---

This article is from a paper entitled, "Air-Chamber Blasting in Coal Mines," read before a meeting of the Mine Inspectors' Institute of America at Peoria, Ill.

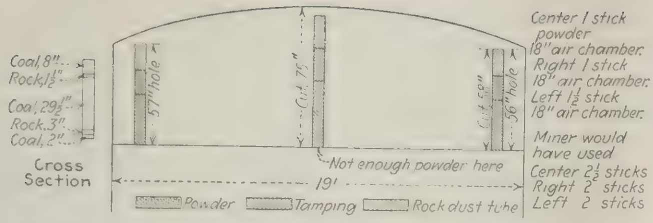


**Fig. 1—Loading in a 19-ft. Room**

Three sticks of powder were saved in this room over what the miner would have used by ordinary methods. Although too little explosive was used in the center hole, the coal was brought down in better shape than usual and far less smoke was made.

heavy shots, as are common in the states named, are here unknown. Solid shooting is prohibited by law. Some of the miners still use squibs, but safety fuse is the means generally employed in firing shots. Practically all the miners speak English and about 95 per cent are native born. As a class their natural thrift impels the practice of rigid economy in the use of explosives.

In these tests empty tubes constituting air chambers were placed next to the explosive charge, regardless of whether this was black or permissible powder. The remainder of the hole was firmly tamped with rock dust. Inasmuch as some of the miners used squibs it became necessary to provide a blasting barrel to guide the squib around the pasteboard tube. A feed line from an automobile formed an impromptu barrel that served the purpose fairly well until a supply could be procured from Illinois. In those cases where safety fuse was used this was carried along the bottom of the drill hole against the outside of the air chamber.

### LESS POWDER REQUIRED

By placing the explosive in the bottom of the hole and an air chamber between it and the stemming, the total disruptive force generated was distributed over the length of the charge plus that of the air chamber and its shattering action cushioned accordingly. Experiments were conducted with both black and permissible powders but best results were attained with black powder. When air chambers were used, about one-half the quantity of explosive was necessary to bring down a given amount of coal as when no air chamber was employed. The yield of lump coal, however, was greatly increased.

With black powder, loaded as above described, no flame was noted upon firing. It was hoped that the force of the explosion would blow the ground limestone from the drill hole and scatter it over the workings. It was found, however, that when this material was tamped fairly tight none of it was thrown into the air. Almost invariably the explosive seemed to expend its energy in compressing the rock dust instead of blowing it from the mouth of the hole.

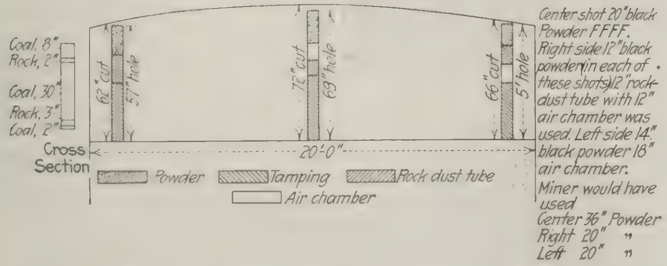

**Fig. 2—A 20-ft. Room Cushion-Loaded**

Here is a combination of air-chamber and rock-dust tube tamping, used in the center and at the right side of the room, with an air-chamber next the explosive on the left side. The saving of explosive over what the miner would ordinarily use was appreciable.

When air cushioning was used in breaking binders and partings the results were excellent. Binders, several inches in thickness, were generally broken into large pieces that could easily be handled by the loaders and separated from the coal adhering to them. The pieces of foreign matter were of such size that they could be picked out by hand without the aid of a shovel. The coal was thus kept cleaner by this method of blasting.

Although it should be remembered that the charges of explosive used in the coal mines of Maryland are small as compared to those used in most other states, yet, inasmuch as shooting is done by the miners while all other employees are at work, the smoke causes appreciable inconvenience. Naturally this smoke is most objectionable in narrow work such as at entry and air course faces. The use of air chambers decreased by about 50 per cent the amount of smoke given off in blasting.

Concerning the suppression of flame, the demonstrator reports: "I cannot state definitely that rock dust will eliminate all flame from a shot but will say that we were unable to observe any flame from any shot fired while using rock-dust tubes." The manner of loading some of the holes, the charges employed, and the cross sections of the beds are shown in the accompanying drawings.

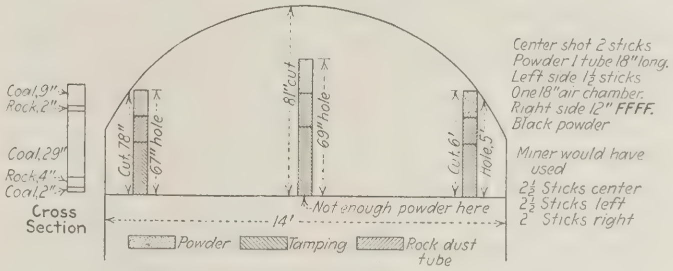

**Fig. 3—Cushion-Blasted Cross Cut**

Although the charge of explosive was admittedly too light in the center hole, yet results were fairly satisfactory. It is well known that in shooting coal, a heaving rather than a shattering action is desirable. The air chamber seems to deaden or muffle the force of the explosive, giving the heaving effect necessary.

The following facts were established from these experiments:

(1) The rock-dust stemming was not projected into the atmosphere either when it was tamped loose or when placed inside pasteboard tubes. In every shot fired, however, the stemming was firmly tamped and never left loose in the drill hole.

(2) No flame was observed when either black blasting powder or permissible explosive was used with an air chamber.

(3) The yield of lump coal, even in beds where the coal was of the softest character was increased by the use of the air chamber. The results obtained were conclusive in this regard.

(4) Little or no smoke or fumes were evolved when the air chamber was employed. Some shots were tried in a fire-clay mine and gave results highly gratifying to the management, as frequent blasting is necessary in mines of this kind.

(5) In every instance a saving in explosive was noted. So marked is this economy that it is believed the miners would be glad to purchase the necessary tubes themselves. Inasmuch as these tubes may be procured at a delivered cost of less than 1c. each, the operator might advantageously furnish them to the

miners gratis. Their cost would be far more than outweighed by the increased yield of lump coal obtained.

It is my opinion that an air chamber in front of a charge of explosive affords a factor of safety. If the miner has used too large a quantity of explosive the air chamber furnishes room in which the disruptive force generated may expand, thus venting a portion of its energy while the balance takes effect on the coal. The explosive force is distributed throughout the portion of the hole occupied by both the charge and the air chamber. This causes the coal to be broken down in larger lumps than would be the case if no air chamber were employed. The air chamber thus forms the miner's safeguard both in respect to the quality of coal produced and the efficient use of the explosive employed.

### Educational Work Necessary

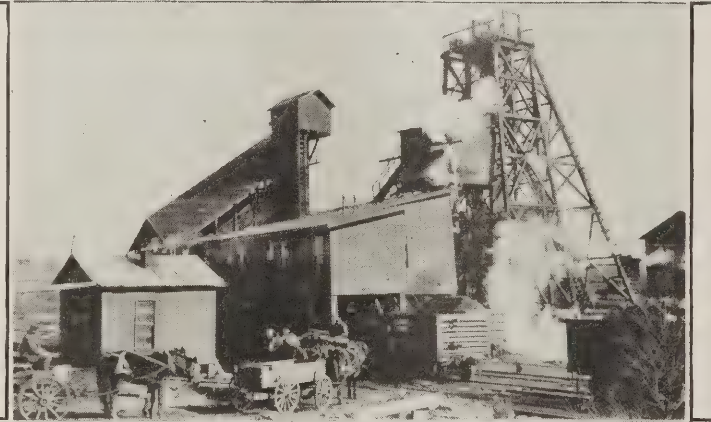
Nearly every practical miner, who after years of work at the face has reached a position of responsibility, will stoutly maintain that all drill holes, especially those employed in shooting off the solid, should be firmly tamped from the charge to the collar. Such men do not take kindly to the air-chamber method of shooting and it is difficult to induce them to consider it at all. Moreover, the laws of some states require that charges be tamped solidly to the mouth of the drill hole. Indeed, I am told that one mine inspector recently instituted legal proceedings against a man who tried the air-chamber method of blasting. It will be seen, therefore, that much educational work remains to be done before mining men in general accept air-chamber blasting as good practice. The mining laws of some states will have to be amended before the benefits of this method of blasting may be enjoyed by coal operators doing business within their boundaries.

Tests made in certain western Pennsylvania mines as well as some in Illinois have demonstrated that the quantity of explosive necessary to bring down the coal can be greatly diminished by the use of air spacing. The Pennsylvania experimenters found that best results were obtained, both as regards the percentage of lump coal produced and the shape in which it was brought down, by placing the air space in front of the charge. In these tests three 1¼x8-in. cartridges were pushed to the bottom of a 2-in. bore hole, without slitting or ramming. A spacer was next pushed back against the charge of explosive. This afforded an air chamber 24 in. long in front of the charge. The balance of the hole was then tamped tightly with moist clay.

Another plan tried for distributing the explosive force was the substitution of 1¼x8-in. for 1¾x6-in. cartridges. In this case a reduction in the weight of the charge used was obtained, as well as better results in blasting.

## Operations of the Hartman Coal Corporation in Kentucky

Victoria No. 11 mine (above), Morton's Gap, in the western Kentucky field where the No. 11 seam averages 78 in. in thickness. This mine has a daily capacity of 1,200 tons.



The Victoria No. 9 mine (left) of the Hart Coal Corp., near Madisonville, Ky. Part of the headframe is new, having been rebuilt to replace that portion destroyed when an explosion occurred in the mine last October.

White City mine (below) of the Hart Coal Corp., at White City, Ky. This mine was formerly the property of the Kingston Coal Co., of Kingston, Pa.

# Mine Electrical Man's Work Makes Him Resourceful

## Under Adverse Conditions He Often Has to Take Equipment Apart as Though Transporting It in Africa—Work Never Ends

BY AN ANTHRACITE ELECTRICAL ENGINEER

WHEN a young man enters the employ of a coal company and joins the staff of the electrical organization, he has certainly settled himself upon a job which will give him a broad variety of training. A few experiences which I have had will illustrate this.

The other day an electrical engineer for a large coal company told me that a friend of his working for a street railway company asked him if he had large transportation problems such as are found in street railway systems. As a matter of fact, this coal mine electrical engineer had under his supervision five times the electrified trackage that the street railway engineer had in that same area, to say nothing of the mine haulage system outside the territory of the traction company.

**The Father of Them All**

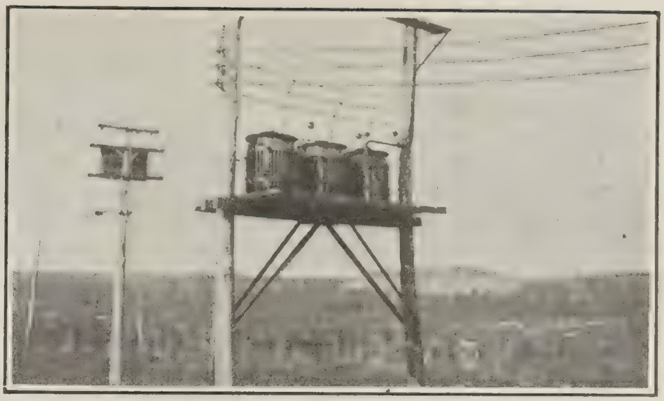
This automatic substation, the first one installed in any coal field, went into service for the Lehigh Valley Coal Co. in November, 1921. It is equipped with a rotary converter which is started and stopped by means of a push button located about one-half a mile from this station.

Why, some of the coal companies in our region generate and use more electrical power than is required for any of the largest cities in the same territory! Thus plenty of opportunity is presented to the mine engineer to learn all that the public utility engineer must know about steam and electric generation, transmission, distribution, switching, protecting and operating.

This electrical energy must often be converted from alternating to direct current and applied at many different voltages. Thus, the mine man encounters almost every type of direct- or alternating-current problem.

With some mining companies, the electrical engineer is in charge of all the equipment to which an electric motor is connected. This means that he must know about traffic management and also be a hoisting, hydraulic, and ventilation engineer, not to mention a few other kinds of expert.

The electrical work the mine electrical engineer must do is certainly widely varied. Often he has to apply ideas and methods used in many other industries. The use of the automatic substation illustrates the point.



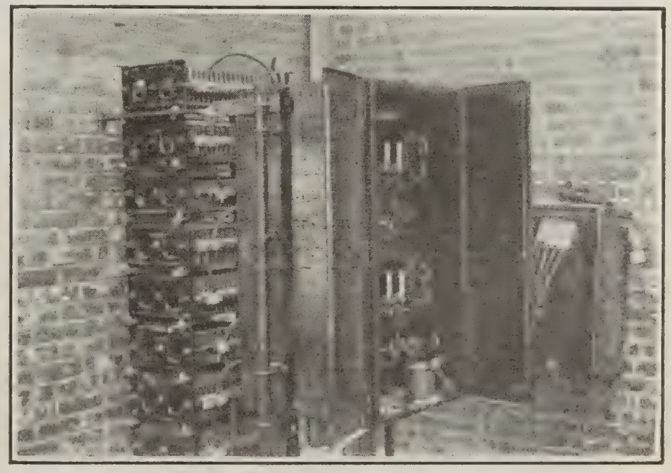
**Temporary but Serviceable Installation**

Before a permanent installation of equipment can be made, temporary power service often is required. This looks like doing the work twice, but how else can power be supplied for lights and construction equipment.

Distribution of direct current for use in the mines for haulage, pumping, hoists and so forth, in the most economical fashion has been greatly aided in the last few years by the adaptation of the railway automatic substation to meet mining needs. In an accompanying illustration is shown the first automatic station placed in service in any coal field. It was installed by the Lehigh Valley Coal Co. near Hazleton, Pa., in November, 1921. Here may be seen one of the great advantages of the automatic. Its location is central to the load. The messenger feeder construction extending out from both sides of the building can be seen plainly.

This station, about a quarter of a mile from the nearest hoisting engineer, is controlled by a switch in the hoist house. The station itself, though readily accessible for inspection, is located in the middle of a field near the "patch," partly surrounded by mine caves. The messenger feeder lines terminate at points where the cables are dropped through boreholes into the mines. Two feeders from this substation enter the mines in this manner.

Electric line work about the mines ofttimes affords an electrical engineer the best practice in the world. In daily overcoming difficulties and doing something new, he becomes well fitted in a few years to face almost any situation that is likely to arise. Company railroads shift frequently, strippings require more room, a subsidence breach opens out dangerously near the



**Where Electric Equipment Went in Quicker than Bricks and Roofing**

Sometimes the installation of electric equipment in a new building proceeds faster than the construction of the building itself. These hoist resistance grids were set up within walls but with the sky for a roof.

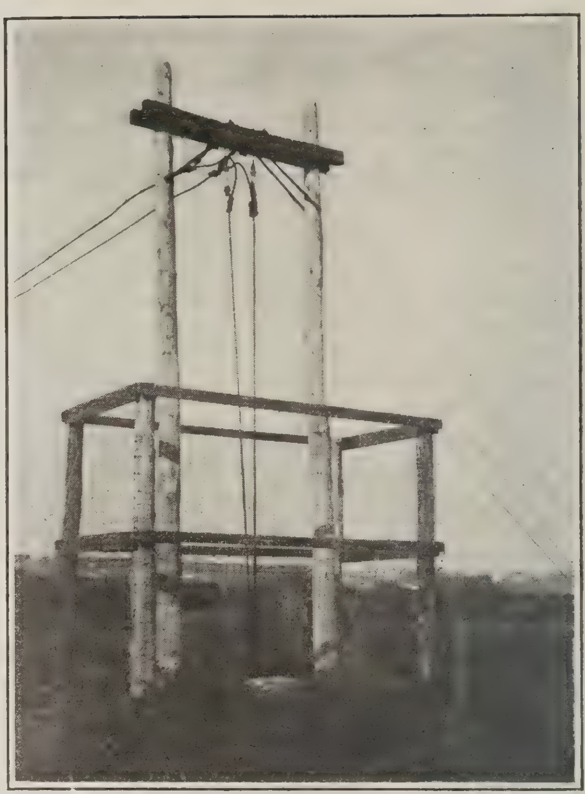
equipment under his supervision, or a new dump starts—the linemen must get busy to preserve his line and keep it in operation. He is forever on the jump.

A common occurrence is to have a mine-cave hole open up right under a pole—such things usually happen on holidays. Ask any lineman, he'll tell you. To keep going up to schedule, when the force at the colliery is low and labor is scarce, these men frequently have to dig their own holes, blast, clear and burn brush, and then take up the tools of their own trade and set up the poles and string the wires. These duties are particularly difficult when the gang is limited and the time allotted for the work is short, as so often is the case.

A set of accompanying photographs presents a sort of "movie" of the operations involved, employing but a handful of trained linemen and a group of "hands" often different at each job each day, whose efforts have to be kept co-ordinated by the line foreman. After many trying delays and usually with a great rush at the end to get finished over the weekend, ready for Monday, the line shapes itself again, the "lokie" can proceed over its new roadbed and the foreman can puff his pipe in satisfied contemplation of a line comparing right well with the big brothers which the public service companies erect with their complete facilities, standardized material and fully trained forces.

**Line Construction Job "in Motion"**

Unusual conditions at the mines often call for service from all sorts of workmen. Often a subsidence or changes in surface track systems require quick construction of power lines. This work must be done by men employed at various types of jobs around the mines, nevertheless, the grade of work done by them under adverse or emergency conditions compares right well with that done by the permanent gangs of the public utilities.



**Puts Power Where It Is Needed**

The automatic substation provides a means of supplying direct current directly into load centers. Here is the place where the feeders drop into the mines.

When a new slope breaks its way through the side of a mountain possibly a mile from the nearest surface road and the executive office approves an appropriation for an automatic substation and electric hoist to be located there, the electric construction engineer usually strokes his chin, views the surroundings, and wonders how soon Ford will perfect the "Lizzieplane."

In time he sees a crude "road" broken through by the mine teams hauling props for the workings, and he watches the precarious angles at which the wagons careen up and down the hillside. He can't figure on tractor haulage to transport his machinery or even use a heavy winch. He is practically dependent on these wagons of light capacity for his transportation problems. So he accepts the inevitable and sets about tearing his equipment apart limb by limb.

Mining conditions may necessitate overtime work to get the electrical equipment at the new slope going. The illustration showing three transformers on poles gives a view of such a location with the main colliery slate bank visible in the distance. Here are shown the power company's line, its metering pole and the coal company's "temporary" substation—one that has given service for over a year to an air compressor, fan and, more recently, a hoist. In an interior view of the hoist house can be seen the stack of grids for the permanent hoist and the contactor panel around which the walls were built after the hoist had been completely wired up. The brightness at the top of the picture is a clear indication of the absence, as yet, of a roof. Power on the spot was necessary, however, and the electrical engineer, in spite of difficulties, made certain that it was delivered.

# Illinois Mining Institute Discusses Machine Loading And Rock Dusting

ROCK DUSTING and mechanical loaders were the main subjects this summer before the Illinois Coal Mining Institute on its annual boat trip on the Mississippi River. A large group of coal mining men, consulting engineers and equipment salesmen made the three-day tour on the new steamer, Cape Girardeau, from St. Louis, Mo., down the river and back with stops at the towns Herculaneum, Chester, Commerce and Cape Girardeau. The party returned to St. Louis on June 21, having enjoyed a combination vacation and technical training tour.

On June 19 the party made a 40-mile trip by autos to the Flat River lead district where they were the guests of the St. Joseph Lead Co., the St. Louis Smelting and Refining Co., and the Desloge Consolidated Lead Co. A group went underground at each of these mines where they saw several types of mechanical loaders, including the St. Joseph type of Thew, the Myers-Whaley, and the Conweigh. In the afternoon the groups made an inspection trip through the concentration, flotation, and power plants. The Lead Belt golf course was placed at the disposal of the golf fans.

In the evening the members had the satisfaction of hearing from an old associate concerning mining practice in Great Britain, France, and Belgium. J. T. Ryan, vice-president of the Mine Safety Appliances Co., showed an interesting set of slides and called attention particularly to the new developments in the Kent and Yorkshire fields of England.

One afternoon on the boat was given to the subject of rock dusting, the program including the following papers: "Coal Mine Explosion Hazards and Safeguards," by J. E. Jones, safety engineer, Old Ben Coal Corporation, West Frankfort, Ill.; "Recent Developments in Rock Dusting in Europe," by J. T. Ryan; "Rock-Dusting Costs," by George C. McFadden, assistant to the vice-president, Peabody Coal Co. A paper on "Rock Dusting in Pennsylvania," by T. G. Fear, superintendent, Inland Collieries Co., of Indianola, Pa., was read by Mr. Ryan. Mr. Fear reported that about 100 mines are now rock dusting in Pennsylvania and West Virginia, practically all of this development having come in the last eighteen months.

A lively discussion followed these papers. J. H. Haskins, state inspector for the Illinois Department of Mines, suggested the appointing of a committee to co-operate with federal and state officials and with other associations in the formulating of plans, standard practice, and rules for rock dusting in Illinois. President Smith will name such a committee.

G. E. Lyman, general superintendent of the Madison Coal Corporation, described conditions at the new No. 12 mine at Cambria, Ill. In addition to dusting with rock, the company is using rock dust for tamping at various mines and practically has eliminated fires from shots. At one mine it previously had been necessary to use four fire-runners. These are no longer required. G. C. MacVean, of the Southern Gypsum Co., spoke briefly on the use of gypsum as rock dust. Thomas English, of the Illinois State Department of

**Down the Mississippi River on the Steamer Cape Girardeau**

At the right are the officers and committees of the Illinois Mining Institute. They are, reading from left to right, front row: William E. Kidd, John E. Jones, J. A. Jefferis, Frank F. Tirre, J. A. Garcia; second row: George K. Larrimore, D. D. Wilcox, E. G. Lewis, Charles Gottschalk, H. E. Smith; third row: L. E. Young, A. C. Callen and Captain W. H. Leyhe.

Below, at the left, is the new steamer Cape Girardeau, which carried the Institute members on their annual outing down the Mississippi River. The illustration below, at the right, shows the mining men embarking on the Cape Girardeau after a day's trip in the lead district. During the three-day trip stops were made at Herculaneum, Chester, Commerce and Cape Girardeau.

Mines, reviewed safety work and spoke of the necessity for hearty co-operation with the department.

J. A. Garcia, who presided over the Saturday afternoon and evening meetings, pointed out the fact that many men were present solely on account of the papers to be presented on mechanical loading and made an appeal for Illinois operators generally to study the equipment on the market and the mining practice best adapted to the operation of machines. It was agreed that none of the papers on the subject would be published and no detailed report of the discussion was to be recorded in order to encourage a free and general discussion.

Prof. A. C. Callen, head of the mining department of the University of Illinois, first presented a general paper on loading machines and emphasized the advantages that would come from concentration of work and closer supervision if loading machines were installed generally.

Charles Gottschalk, consulting engineer, of Evansville, Ind., gave a paper on "Methods of Mining Suitable for Mechanical Loading." In his opinion it will be possible to develop efficient loading practice in connection with room-and-pillar mining. He urged concentration of operations, provided there was no interference with underground transportation. The successful application of loading machines, he said, will result only from hard, patient work by the organization at the mines, careful analysis of the problem, and original thinking.

C. S. Sandoe, general superintendent of the West Virginia Coal Co., cited the essential problems which would have to be solved before loading machines could be considered a commercial success. W. L. Strawn, of the United Iron Works, Kansas City, Mo., gave a brief report on the use of conveyors in long-wall mining in the southwest and pointed out how these conveyors could be used in the panel system. Inspector Haskins showed that concentration of workings would result in reduction of accidents.

### Machines Increase Opportunities

Lee Haskins, superintendent of the J. K. Dering Coal Co., at Eldorado, Ill., stated that the experience of his company was limited but that he believed in the ultimate successful installation of loading machines in Illinois. J. D. A. Morrow, Joy Machine Co., Evansville, Ind., gave an inspirational address on the opportunities in the coal mining industry as a result of mechanical loading. He suggested that point of view, originality of mind, and conviction that success was reasonably certain were essential to any organization attempting to introduce loading machines.

I. N. Bayless, superintendent of the Union Colliery Co., Dowell, Ill., gave data on the operation of the two Goodman power shovels and one Myers-Whaley machine. He pointed out various practical problems related to the use of loading machines in room-and-pillar work in mines in Illinois, and gave it as his opinion that machines would be used successfully. J. E. Barlow, Goodman Manufacturing Co., described briefly the use of the scraper loader as manufactured by his company.

Frank Westwood, electrical engineer, Southern Coal, Coke & Mining Co., St. Louis, stated that the Wilson loading machine was being used in his mines but did not give any data on the tonnage being handled. W. C. Evans, vice-president of the Crescent Coal Co., Peoria, Ill., referred to problems of the Peoria field in which the modified system of longwall mining is being sought in order to permit the use of loading machines. John L. Clarkson, general manager, Clarkson Coal & Mining Co., Nashville, Ill., was called on to describe a new loading machine that is being built for his company in St. Louis. He then discussed ways and means for cleaning mechanically-loaded coal underground.

In his talk on the cost of rock dusting, Mr. McFadden said that at first it seemed an enormous task to rock dust a 20-year-old Franklin County, Illinois, mine along the standards recommended by the U. S. Bureau of Mines and the Illinois Department of Mines and Minerals. However, upon carrying out such a program at Mine 19, operated by his company, the Peabody Coal Co., the initial dusting proved to be a simple job.

### Enumerates Rock-Dusting Costs

Rock dust received at the mine in open cars was sacked and delivered to a 75-ton storage room provided on the shaft bottom, and then distributed during the night shift along 105,000 lineal feet of roadway, air course and room necks which covered all open entries whether used or abandoned. In addition thereto rock-dust barriers containing 8 and 16 troughs to the barrier were provided and are maintained in the entrance of each entry throughout the mine.

The cost of improvements, consisting of truck, fan, motor, cables, hopper, tubing and storage bin, amounted to $1,065. Labor and material cost for the initial dusting, which provided slightly over 2 lb. per foot distributed on roof, ribs and floor of entry, and 80 lb. of dust per barrier trough, were as follows:

| | |
|---|---|
| 160 tons rock dust, delivered in storage bin on shaft bottom | $1,104.00 |
| 154 trough barriers | 884.16 |
| Labor dusting haulage roads | 361.00 |
| Labor dusting air courses | 520.00 |
| Labor and material cost | $2,869.16 |

For the initial dusting the average cost, including labor and material for distribution of rock dust and erection of barriers (allowing for depreciation on equipment) amounted to 2¾c. per foot of open entry.

In repeating for second and subsequent dustings, which it is proposed to perform every six months or sooner, if required, there will be a small increase in length of main and cross entries. With increased length of entries, added barriers, maintenance of barriers in place and continued dusting of roadways and air courses at 6-months intervals, it is estimated that the average cost based on the present wage scale for this important safety measure will be 1.6c. per ton on the output for the next 10-yr. period.

### Pioneers Continue Practice

"The Old Ben Coal Corporation is now starting its ninth season with rock dusting, the first season being the winter of 1917-1918," said Mr. Jones in his paper on dusting. "The practice at first was to install rock dust in such quantity and manner at all intersections of entries and at 500-ft. intervals so that dense clouds of the rock dust would be thrown into suspension in the event of an explosion to extinguish the flame. Collapsible overhead barriers on haulage roads, platforms on roadsides and troughs in trackless passages was the equipment used to contain the rock dust.

"Nine explosions have occurred, seven of which reached a rock-dust zone where the flame was extinguished by the first dust in the path of the explosion. Two were not of sufficient intensity for flame to reach the dust zone, although the force of these threw the rock dust into suspension. Two were of enormous intensity in force and flame and undoubtedly would have been disastrous had it not been for the rock dust installations.

"Yet with such perfect operation with the equipment there was that possibility of an overhead barrier being delayed in its action until the flame had passed, or that the barrier had been accidentally or mischievously tripped just prior to the explosion so total dependence could not be placed on barriers, because there was possibility of failure and hand dusting of roof and ribs in the vicinity of overhead barriers was done for a distance of 100 ft. in all available directions from each. The locations then left unprotected were the panel entries inby room No. 1 and all other entries between rock-dust zones. The need of rock dusting such unprotected territory and the need for a machine to do the work was apparent, and while a machine was in process of development some of the Old Ben mines were being rock-dusted by hand.

"The machine we developed, (two are now in operation) thoroughly coats all surfaces on haulageways and openings 30 ft. from the track. The problem of rock-dusting aircourses, however, is not so simply solved. It costs more to rock dust trackless passages than haulage ways. The method now in force is to blow dust into the aircourses at openings at regular distances, allowing the ventilating current to carry the dust as far as it will. This method does not result in a good, rock-dust coating on the roof, but gives a fair coating on the ribs and a thick coating on the floor. The dust coating on an aircourse floor usually remains dry for an indefinite length of time, since the fire clay usually is covered by a layer of dry, fallen, top coal.

### DUSTING AIRCOURSES NOT SUFFICIENT

"However, full dependence is not placed on the rock-dust coating of aircourses, for dust in troughs is installed at all intersections of the aircourses with other entries. Full dependence is placed in the dust coating of haulageways, for it is a simple matter to keep the ash content on the roof and ribs greater than 70 per cent. In addition, however, dust trough barricades are installed in wide places along haulage roads at 500-ft. intervals to give additional protection, but primarily to have rock dust in quantities available in the event of a mine fire.

"It has been found that the best time to coat the mine with rock dust is in the summer and fall when the mine surfaces are damp and the rock dust sticks better than in winter. An effort is made to have the rock dusting of each mine completed before the arrival of cold weather.

"An important factor of safety is the knowledge of the methane content of the mine air of each air division and the ash content of the mine dust. Sampling and analyses determine these, the analyzing being done in the Old Ben laboratory. Samples of dust are collected by the vacuum method because of the greater speed of collection than by dust-and-pan method and because of minimum loss of dust in locations where the mine air velocity is high.

"The samples of roof and ribs and the floor samples are taken separately. The average of the cross-section is determined by doubling the figure representing the ash content of the roof, ribs and floor and dividing by three. The surface of the roof and ribs is double that of the floor. By this measure the average ash content of haulage roads in six large mines that had been dusted six months prior to sampling gives an ash content of 74.8 per cent through a 100-mesh sieve.

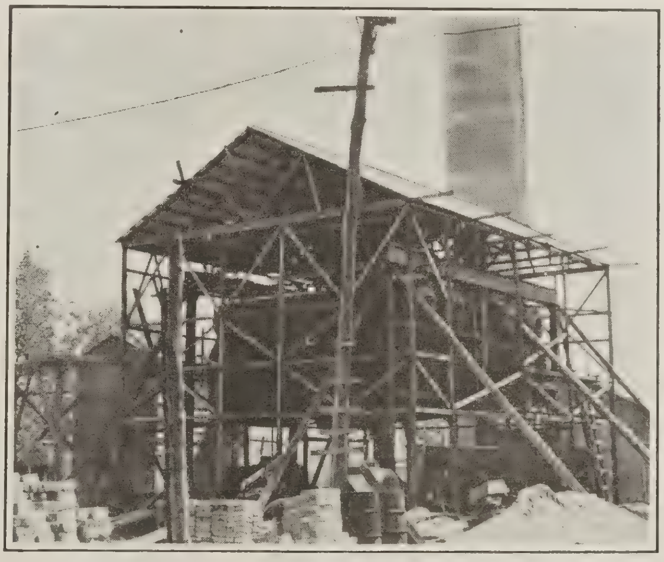
### AVERAGE ASH CONTENT MISLEADING

"At first it would seem that redusting is not necessary with such a high ash content. This average, however, is from analyses that vary from 53 per cent to 90 per cent ash with many samples showing 58 per cent ash content. These lower readings are always found on the main haulage roads where the ventilation velocity is high and where long, fast-traveling trips move. Both these factors produce a sweeping action that tends to blow the rock dust into suspension. It must also be considered that new territory is developed that must have its initial dusting.

"The status of rock dusting in Illinois is favorable. A number of mines having a potential capacity of 100,000 tons per day are protected by dust or are in process of getting this protection. They employ, under normal working conditions, approximately 15,000 men underground. These operations are all in the extreme southern end of the Illinois coal field where the greatest explosion hazards of the state exist.

"To fully protect the mines against explosions, all of the mines having an explosion possibility—this condition determined not by experience but by inspection and analyses—must be safeguarded. The practice of rock dusting has proven to be practical in application, efficient in performance, harmless to mine and men and reasonable in cost."

---



**Further Modernization and Electrification Necessitate New Boilers for Kentucky Mine**

Two 500-hp. Keeler water-tube boilers are being installed at No. 1 mine of the Norton Coal Mining Co., Nortonville, Ky. Refuse from the picking tables will be crushed and burned on inclined, overfeed stokers. Natural draft will be supplied by the 165-ft. concrete stack, in the background. The engine room equipment of the new power plant will consist of one 300-kw., 2,300-volt, alternating-current unit and one 300-kw., 250-volt, direct-current unit. The new equipment will replace an old plant containing four 150-hp. hand-fired boilers and several direct-current generators. Hoisting by steam will be continued, but it is planned to replace the old hoisting engine with a new one, in the near future.

## Public Seems to Expect Government To Intervene in Event of Coal Strike; Obligation Might Devolve on Congress

**By Paul Wooton**

Washington Correspondent of *Coal Age*

Intimations from official quarters that the federal government is not going to pull anyone's chestnuts out of the fire this time, if a coal strike is precipitated, is being met with some skepticism. The federal government under similar conditions in the past, it is argued, has been loud in its declarations that it would keep hands off, but in the end generally has been inveigled into intervention.

This reasoning, however, fails to take into consideration that there has been some change in national thinking since last there was an emergency in coal. Any policy other than one of "hands off" would run counter to the political philosophy of the administration. According to the doctrine President Coolidge has been preaching the states must rise to their responsibilities. If any governmental intervention should be necessary doubtless he will feel the states, who have some authority to back them up, should do it. Federal officials are about to be fed up on undertaking tasks to which their legal authority does not extend. They have clearly in mind the ineffectual effort made during the last strike to exert influence when their only weapon was persuasion. Moreover, it must be apparent to all that there is no political reward for such endeavors, which usually draw little but abuse from all quarters.

### Congress Might Get Job

If a situation should arise where federal action could not be avoided, in view of the feeling among officials and of the policies of the administration, it would seem more likely than not to pass the responsibility on to Congress, possibly with a reminder that a commission of its creation studied the coal question exhaustively and made certain recommendations. Sight also should not be lost of the fact that reasons for calling an extra session of Congress have accumulated to the point where a coal strike might furnish the added demand necessary to cause the legislators to be assembled.

Attention also is called to the fact that the federal government has intervened so many times in the past when an emergency in coal has arisen that the public has come to regard that as the usual procedure. There is a widespread impression that the federal government will look out for domestic consumers at least.

The report on consumers' stocks issued last week by the U. S. Geological Survey in a general way shows that consumers of bituminous coal evidently are not nervous over the prospect of any interference with distribution. Their stocks are down to normal for this season of the year. It shows that the great stocks laid in in anticipation of a possible strike in 1924 now have been liquidated. Thus an influence which depressed the market for more than a year has been removed.

The report makes it very clear that consumers are not in a position to forego new supplies for any considerable period, which is likely to prompt heavy buying the minute consumers take seriously the threatened suspension in the union field.

### Consider British Situation

The other important circumstance which the anthracite conferees will not forget is the possibility of a strike in the British Isles. The importance of strikes in both countries at the same time can be exaggerated easily, as the amount of coal that can be shipped across the Atlantic naturally is limited. A strike in Great Britain, however, would take out of the country a considerable quantity of the best coal at a time when the entire non-union production would be needed to supply domestic requirements. With the mines of the Ruhr in a position to produce much more coal than ever before, the amount of European business which would come to the United States would be limited. The non-union fields, now in a position to handle export business, probably would be called upon to supply Great Britain's customers in this hemisphere and a much larger proportion of the bunker trade.

The British situation is being watched closely in Washington, more because of the lessons which we can learn from the developments in that situation than for the influence which simultaneous strikes might have on the coal business in this country. The British situation is believed to have reached a point where a comparatively small additional loss of business has brought about a serious situation. Sales are not running far below the boom year of 1923, but the losses in exports have been made up partly by an improved domestic demand. Purchases for industrial consumption within Great Britain, however, have not been made, to any great extent, at the mines which have suffered most in the loss of export business. This has shifted the demands on certain areas to such an extent that mines in the Forest of Dean, in South Yorkshire and in Nottinghamshire, for instance, are having difficulty in filling their orders and are offering premiums to secure men.

### *Buy Hard Coal Early, Says Lehigh Valley R.R.*

The Lehigh Valley R.R. devoted a large portion of a recent report on operating conditions to an analysis of the present coal situation. The company said in part:

"We again take this opportunity of calling the attention of the members of the Atlantic States Shippers Advisory Board to the importance of urging upon their members, as well as of users of anthracite coal, the desirability of placing their orders and receiving their winter's supply of coal during the summer months.

"If dealers and consumers of anthracite coal will order and receive their coal during the summer months, it will not only insure them a full supply for the winter if there should be a suspension when the existing agreement with the anthracite miners expires on Sept. 1, but it will result in reducing the peak load in the fall when all other traffic is at its height, assisting the railroads materially in maintaining the excellent service now being rendered."

One of the things which is discouraging the operators in South Wales and in Northumberland and Durham is the prospect of permanent loss of export trade. They are not in a position to compete successfully in many markets with German coal, while an increasing amount of the Italian trade is certain to be lost because of hydro-electric developments. The same applies in a more limited way to France, where also domestic coal production, with the rehabilitation of all its own mines, again is large.

Neither the coal owners nor the mine workers in Great Britain have forsaken the profit-sharing principle which has formed a part of recent agreements. The real bone of contention is the amount of the minimum wage which is to be paid the mine workers. Evidently the demand of the operators for an eight-hour day is submitted for trading purposes. Hours of labor in coal mines are limited to seven hours by statute. That limit cannot be exceeded by a premium. Legislation must be obtained before that demand could be attained, and no such legislation is in prospect.

One of the fundamental troubles with Great Britain is that the cream of its coal is gone. After centuries of mining even those generous deposits have reached a point where recovery is becoming much more expensive.

### Criticism Puzzles Commission

At the Federal Trade Commission a loss to understand why it should be criticized for issuing its report on premium anthracite is professed. It is stated that the delay in its issuance was due to the fact that all of the commissioners had not had an opportunity to make their studies of the report. It is admitted that there is nothing new in the report, but in that connection attention is called to the fact that a demand suddenly has developed for the report of the Harding Coal Commission, which likewise contains no information which has been gathered in recent years.

On the other hand many see in this report an effort to throw a monkey wrench in the machine at a critical moment. There is a loss to understand how the report could have any constructive purpose, since it is based on a very small amount of coal. Looking at the matter strictly from a public standpoint the issuance of the report is widely regarded as having undesirable.

The Federal Trade Commission always has had great hope of winning the Maynard case. It is just conceivable that this report is put out with the idea of paving the way for current reporting on costs, if the legal barrier should be removed.

## Utilities Consume More Coal And Less Oil in May

Public utility power plants in the United States consumed 2,962,049 net tons of coal in May, according to a report by the U. S. Geological Survey. This compares with 2,959,593 tons in April. Fuel oil consumption by utilities in May totaled 679,655 barrels, compared with 698,811 barrels in April.

The average daily production of electricity by public-utility power plants in May was 167,200,000 kw.-hr. about $2\frac{1}{2}$ per cent less than the average daily output for April. The usual seasonal decline in the daily production of electricity has continued from January to May at about the same rate as during the same months of 1924.

The daily production of electricity by the use of water power during May was about 3 per cent less than for April, which makes April the peak month for the year. Usually the month of May has the highest average daily output of the year.

© Keystone View Co.

**John Markle**

President of the Jeddo-Highland Coal Co., one of the large independent producers of anthracite, who sailed July 3 on the Majestic for a trip through Europe that will occupy at least four months. Mr. Markle lives in New York City.

## Says Ohio Coal Industry Faces Worst Year

Ohio probably will suffer its greatest slump in mining this year, Jerome Watson, mine division chief, declared when figures were submitted by Otto W. Brach, head of the statistical division of the state Department of Industrial Relations, showing that production in 1924 had decreased 26 per cent from that of 1923 and that nearly 300 more mines had been closed than in 1923. A further reduction in output of perhaps 30 per cent was forecast for 1925.

As compared with 40,904,275 tons of coal mined in Ohio during 1923, only 30,077,290 tons was produced in 1924. Belmont County produced 10,973,530 tons as compared with 12,676,797 tons during 1923. Jefferson County produced 4,348,329 tons; Athens County, 2,972,483 tons; Guernsey County, 2,633,807 tons; Harrison County, 2,422,023 tons; Perry County, 1,795,700 tons, and Tuscarawas County, 1,065,926 tons.

Mines operating in Ohio in 1924 numbered 1,082, as compared with 1,301 in 1923. It was estimated by Mr. Watson that slightly more than half as many mines have been operating during 1925 as were in 1923 and figures thus far obtained indicate material reductions in production.

The chief means of mining coal in 1924 was by use of machines, which produced 26,130,946 tons. Strip mines ranked next with 2,414,471 tons. Coal picked by hand resulted in a production of 1,531,873 tons. The decreases were evenly distributed over the three methods of production.

Tonnage reported from other counties was: Carroll, 344,719; Gallia, 12,298; Hocking, 710,946; Holmes, 27,221; Lawrence, 112,826; Mahoning, 56,998; Medina, 6,336; Meigs, 223,792; Morgan, 182,294; Muskingum, 380,788; Noble, 493,201; Scioto, 1,868; Stark, 462,552; Summit, 14,694; Vinton, 86,043; Washington, 1,619; Portage, 83,396; Jackson, 160,937; Coshocton, 237,673, and Wayne, 7,289 tons.

## Hard-Coal Operators to Run Two Traveling Shows

So successful was the Traveling Educational Exhibit of the Anthracite Coal Operators which closed at Bethlehem, Pa., early in June, that two traveling exhibits have been planned for the coming season. An Eastern exhibit will get under way at Portland, Me., on July 20 and a Western exhibit starts from Syracuse, N. Y., on Aug. 31. The Eastern exhibit, after a week in Portland will visit Nashua, Worcester, Providence, New Haven, Springfield, Montclair, Trenton, Reading, Camden, Wilmington and Washington. The Western exhibit, after a two weeks stay at Syracuse, will go to Buffalo, Toronto, Detroit, Grand Rapids, Chicago, Ft. Wayne, Toledo and Cleveland. In most of these cities the exhibit will remain a week, and in a few cities two weeks.

The new traveling exhibits will be on a more elaborate scale than the first, because they will attempt to enlighten the public on all of the advantages of using anthracite and will more nearly live up to the slogan earned by the first exhibit as "The Traveling University of Old King Coal." Approved heaters and coal-saving appliances together with devices for improving combustion, such as special grates and blowers, will be shown. There also will be devices that stoke a heater and draw off the ashes automatically, and appliances for making an ordinary heater burn the small sizes of anthracite. Cooking by coal will not be overlooked, as a range for this purpose will be among the exhibits.

A store or showroom in the heart of each city is hired for the exhibit. To these the public is invited through newspaper advertising, and combustion experts and heating engineers in charge will answer questions of those who call.

These exhibits are purely educational in scope and nothing is sold. Practical demonstrations show how to coal a heater properly, how to fix it for the night or in moderate weather so that it will give the maximum of heat with the use of the smallest quantity of coal.

There is an abundance of printed literature distributed free. "How to Cut Down the Cost of Heating Your Home" is a brochure full of facts for those who want to save, and an interesting leaflet, "Which Fuel," which describes the advantages and disadvantages of all fuels now being used for heating the home.

---

Advices were received in the New York financial district last week that the United States Coal Co., with J. O. Bledsoe, St. Albans, W. Va., as a central figure in the project, is being organized to take over several coal producing properties in Kentucky and West Virginia. It is said that the consolidation plans have advanced to the point where terms are being smoothed over between interested parties and that several banks have agreed to finance the new company, which will have an annual capacity of 75,000,000 tons.

## Mine Accidents in May Killed 181; High Rate Due to Major Disasters

Accidents at coal mines in the United States in May, 1925, resulted in the loss of 181 lives, according to reports from state mine inspectors to the U. S. Bureau of Mines. The death rate for the month was 4.15 per million tons of coal produced, as compared with 3.45 in the preceding month and 3.33 for May, 1924. The increased fatality rate was due mainly to an explosion at Sanford, N. C., on May 27, in which 53 lives were lost, and to an explosion at Piper, Ala., on May 31, which killed 6 men. Without these two disasters the death rate for the month would have been 2.80 per million tons of coal mined.

For bituminous mines alone the reports showed 143 fatalities, including the two explosions referred to above. As the production of bituminous coal in May was 35,474,000 tons, the fatality rate was 4.03, as compared with 2.98 for May, 1924, and 3.20 for the month of May during the ten years 1915-1924. For anthracite mines alone the death rate from accidents in May was 4.67 per million tons based on a production of 8,134,000 tons, as compared with a death rate of 4.78 for May last year and a ten-year average rate of 5.55.

Records for the first five months of 1925 show that 930 men have lost their lives in accidents at the mines. The total production of coal during the period was 234,978,000 tons, hence the fatality rate was 3.96 per million tons. For the corresponding months last year the rate was 4.82. The five-month rate for bituminous mines alone was 3.59 in 1925 and 4.73 in 1924, while for anthracite mines alone it was 5.90 as compared with 5.29 in 1924. Production records show an output of 37,259,000 tons of anthracite and 197,719,000 tons of bituminous coal during the first five months of the present year.

Six major disasters with a total loss of 154 lives occurred during the first five months of the present year, as compared with 5 disasters and a loss of 384 lives for the corresponding months of 1924. A "major" disaster is defined as an accident causing 5 or more deaths. The fatality rate per million tons based exclusively on major disasters was 0.66 for the months of January to May, 1925, and 1.59 for the same period last year.

## *Big Saving in Change From Oil to Coal*

The Water Board of Kansas City, Mo., has decided to switch from oil to coal for fuel at its pumping station. This decision was based on an estimated saving of $40,000 per annum, according to word received from W. L. A. Johnson, general commissioner, Southwestern Interstate Coal Operators' Association.

## Bureau of Mines Extends Safety Work

An extension of the work of the Bureau of Mines for greater safety in mining operations is the purpose of a new subdivision of the Safety Service of the Bureau, which began to function July 1, coincidentally with the transfer of the Bureau to the Department of Commerce from the Department of the Interior, according to an announcement by Dr. D. A. Lyon, acting director.

J. J. Forbes, who has served as district engineer in Alabama, has been designated as the chief of the new subdivision, which will be known as the Safety Extension Service. The new subdivision, with the Mine Safety Service, which, under D. J. Parker as chief engineer, has performed notable rescue work at numerous mine disasters and trained thousands of miners in mine-rescue and first-aid methods, will make up the Safety Service of the Bureau, under Dr. T. T. Read, Safety Service Director.

In addition to co-operating with local chapters of the Joseph A. Holmes Safety Association in promoting interest in accident prevention and first-aid training in mining communities, the new Safety Extension Service will, in co-operation with the Mine Safety Service and the Mining Research Division, make field demonstrations and exhibits to illustrate and explain the safety methods, equipment and procedure recommended by the Bureau of Mines.

## Coal-Mine Fatalities During May, 1925, by Causes and States

(Compiled by Bureau of Mines and Published by *Coal Age*)

| State | Underground | | | | | | | | | | | | Shaft | | | | | Surface | | | | | | | Total by States | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Falls of roof (coal, rock, etc.). | Falls of face or pillar coal. | Mine cars and locomotives. | Explosions of gas or coal dust. | Explosives. | Suffocation from mine gases. | Electricity. | Animals. | Mining machines. | Mine fires (burned, suffocated, etc.). | Other causes. | Total. | Falling down shafts or slopes. | Objects falling down shafts or slopes. | Cage, skip or bucket. | Other causes. | Total. | Mine cars and mine locomotives. | Electricity. | Machinery. | Boiler explosions or bursting steam pipes | Railway cars and locomotives. | Other causes. | Total. | 1925 | 1924 |

# Writ of Error Saves Bittner from Jail Sentence; Federal Observers Study Conditions in West Virginia

A writ of error and supersedeas granted by Judge M. O. Little, in the West Virginia Supreme Court on July 10, in Charleston, stays the sentence of Van A. Bittner, chief international union representative in northern West Virginia, who was to have started to serve six months in the Monongalia County jail in Morgantown on charges of contempt of court on Sunday, July 12. The writ is returnable next January.

Bittner had made temporary arrangements to have others take active charge of the work in northern West Virginia, although he probably would have continued to generally supervise the strike from prison.

In addressing a miners' mass meeting in Fairmont Theater in Fairmont several months ago Bittner is alleged to have referred to "infernal injunctions" and intimated that when they ran counter to the rights afforded him under the Constitution of the United States the injunctions would be violated. In his address the speaker made a scathing attack on an official who had an injunction in Monongalia, an adjoining county to Marion, and the attention of Judge I. Grant Lazelle, of Morgantown, was called to his utterances.

### Says Notice Was Too Late

As a result he summoned Bittner to appear before the court and after delivering a decision which required almost one hour to complete, fined Bittner $500 and imposed a sentence of six months in jail. Counsel for the defense in appearing before Judge Lazelle contended that Bittner never had notice served on him about the Continental Coal Co. injunction until after he had delivered the address.

Unquestionably the effort to jail Bittner has had a reaction in the region, and miners, who are naturally sympathetic, seem to be impressed with the alleged spirit of sacrifice that the union leader was willing to undergo.

In the first four days of last week non-union mines in northern West Virginia produced 5,012 cars of coal against 731 cars loaded by union mines. The open-shop plants loaded 1,311 cars on July 7, which was within five cars of the non-union peak of 1,316 cars, established June 30. Union mines produced 223 cars of coal July 9, which is more than was loaded on that basis for several weeks. On the average there were 151 non-union mines at work daily, while 10 union plants continued to work.

Mine No. 1 of the Gilbert-Davis Coal Co., in Scott's Run, has resumed operation on a union basis, according to reports. Some time ago the South Penn Coal Co., in the run, opened up on a union basis, it is reported.

It is reported from authentic sources that representatives of the U. S. Department of Labor are in the northern West Virginia coal fields making an investigation. The exact purpose of their visit is not generally known, but it is presumed that they came because of a telegram that Van A. Bittner, chief international representative of the United Mine Workers, sent to Secretary of Labor James J. Davis, calling attention to the alleged abrogation of contract by the Consolidation Coal Co., the largest signatory to the Baltimore agreement in the region.

During the lull over the Fourth of July the United Mine Workers made an effort to get across some effective organization work quietly. As a result when Monday, July 6, arrived the working force at Pinnickinnick was reduced. The union miners claimed that the mining force was so curtailed that it retarded production greatly. The company said that 113 men were at work Monday and later in the week asserted that additional old employees had returned to this and other mines in the region.

The Consolidation Coal Co., which seems to have made it a rule not to open a mine unless there is business in sight for it to work five days a week, did not start any additional mines last week. It is reported that probably the next mines that it will open will be New England mine, at Watson, adjoining the city limits of Fairmont, and the mine at Monongah, which is joined to it by a breakthrough. The Robey mine of the Hutchinson Coal Co., near Lumberport, Harrison County, began work July 6, with a number of its old force of men, it is reported.

A conference of all the International organization force in the region was held in Fairmont July 8, when the entire situation was gone over. International representatives of the United Mine Workers will visit every local union in the field this week, it was said. It is believed that it is a move to strengthen the morale of the union miners, which up until this time has been firm.

### Lewis May Pull Through

The union miners held a series of mass meetings over the field last week, some of them outdoors, despite daily thunderstorms in the upper Monongahela Valley. General strike talk has been afloat for several weeks in the region and interest rekindled by this may help John L. Lewis to pull through in the region, after what everybody regarded "a lost cause" from the beginning. Some observers, however, hold firm to the belief that the union was beaten from the start, is defeated now and will be totally routed in northern West Virginia.

Attorney Thomas C. Townsend, of Charleston, general counsel of the United Mine Workers, happened into Fairmont last week and admitted that plans are under way for an organization campaign in the non-union fields of southern West Virginia. It is reported that he attended a conference several weeks ago at the residence of Attorney W. A. Glasgow, in Philadelphia, when legal phases of the drive were considered.

**Paved Boulevard at Lynch, Ky.**

This unusual highway—for a mining town—owes its existence to the foresight of the United States Coal & Coke Co., owner of the Lynch Mines, which realizes the importance of good roads in otherwise isolated communities. The square building on the corner to the right is the mine office, and adjoining it is the bathhouse.

Various local unions all over the region continue to pass resolutions pledging loyalty to the United Mine Workers and adherence to the Baltimore wage agreement.

The West Fairmont Shaft operation, which is in the limits of the City of Fairmont, is reported by the Consolidation Coal Co. to be turning away men daily, having more applicants than it can employ. It is said that twenty-five or thirty men who entered Pinnickinnick a week or two after it was started were "salted" there by the miners' union to foment a strike and disorganize the working force. In this effort the union was unsuccessful, the company asserts.

## Coal River Collieries Plans Increased Capacity

Plans were announced July 10 for an expansion of operations by the Coal River Collieries Co. in Boone County, W. Va. One mine which now produces from 1,000 to 1,200 tons daily is to be increased in capacity to 5,000 tons daily. A contract has been awarded by the collieries company for the construction of twenty-five miners' houses at Seth.

Sale to the Chesapeake & Ohio Railway Co. of the Coal River & Eastern R.R., a ten-mile line in Boone County, W. Va., has been definitely closed between the two companies at a price agreed upon by both sides, according to an announcement by the Coal River & Eastern company at Huntington July 10.

The Coal River & Eastern R.R. runs from Seth to Prenter. It was built by the Coal River Collieries Co., which is owned by the Brotherhood of Locomotive Engineers, to serve mines of that company located about ten miles from the main line of the Chesapeake & Ohio's Coal River division.

Approval by the Interstate Commerce Commission is necessary to complete the purchase, which includes only the main line and excludes switch and spur tracks.

## Court of Inquiry Ordered In British Mine Dispute; General Tie-Up Threatened

Stanley Baldwin, the British Premier, made formal announcement in the House of Commons July 13 that the government has decided to establish a court of inquiry to investigate the causes of the present dispute in the British coal mining industry. The chairman of the court will be H. P. MacMillan, a Scottish lawyer, who, though not a Labor Party man, has some sympathy with labor's aims. The second member is Sir Josiah Stamp, president of the London, Midland & Scottish Ry. The third is W. Sherwood, a trade-union leader and organizing secretary of the Municipal Workers' Association.

The appointment of this court had been communicated to the miners' leaders assembled at Scarborough for a federation meeting before it was announced in the House. They agreed to appear before it.

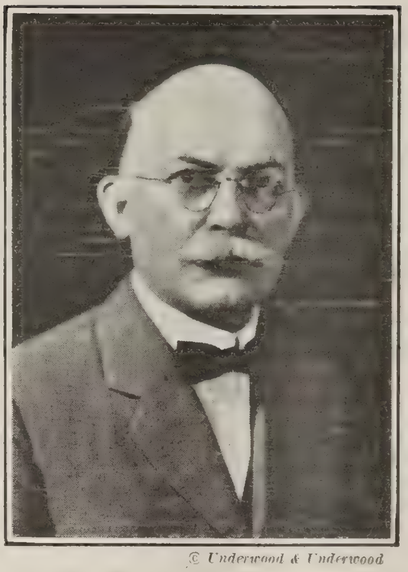
The government's first step toward intervening in the dispute was to name W. C. Bridgeman, First Lord of the Admiralty, as government conciliator. He was formerly Secretary of Mines and is well known and popular with both the mine owners and miners.

The government took a hand when the Executive Committee of the Miners' Federation decided to oppose the employers' demands for an eight-hour working day and a reduction in wages, at the same time refusing to enter into further negotiations until the mine owners' proposals were withdrawn.

The owners declined to withdraw their notices but declared their willingness to meet the Miners' Federation "in a conference upon the question of taking up the discussions at the point where they were suspended." The new offer of the owners was passed on to the miners and the committee of the Miners' Federation made a brief response, expressing "regret to learn that the coal owners have refused our reasonable request."

With the direct actionists in a strong position in the General Council of the Trades Union Congress, there is a threat of a general strike of 5,000,000 workers if the dispute of miners and mine owners is not satisfactorily composed. A. J. Cook and other radicals have been trying to bring about a quadruple alliance of miners, railwaymen, engineers and transport workers to call a general tie-up in the event of the owners refusing to come to terms.

Since the Beckley Pocahontas Coal Co. was sold at public sale not long ago in Raleigh County the new owners have effected a reorganization of the company and have given it a new name —Lecony Smokeless Coal Co. of Besoco, with H. E. Moran, of 32 Broadway, New York City, as president; Richard R. Conant, of the same address, as vice-president and secretary-treasurer, and P. A. Grady, of Besoco, as general manager. This company was sold to the new owners for the sum of $35,000. It had changed hands in 1920 for $750,000. The property of the company is located on Stonecoal Creek, in Raleigh County, West Virginia.



© Underwood & Underwood

**Charles W. Bryan**

Nebraska's former governor announces that he is going into the coal business again next fall. He says he will be the largest wholesaler in the state.

## *Bryan to Sell Coal Again*

Charles W. Bryan, ex-Governor of Nebraska, announced, July 6, at Parsons, Kan., that he intends to enter the coal business again in his state next winter. Mr. Bryan said he had contracted for a large supply of southeastern Kansas coal while in Pittsburg that day, to be distributed through Nebraska this winter. As larger operators denied having dealt with Mr. Bryan, his contract evidently was made with small producers.

"When I was Governor," he said in Parsons, "I tried to get retailers to furnish coal at a reasonable price. They refused, so I bought coal by the carload and sold it to distributors in carload lots. They, in turn, sold it to the people at $5 a ton less than the retailers. I estimate that this saved the people of Nebraska millions of dollars a year. I sold to dealers in 150 towns. The coal, I found, cost $3.25 a ton. The freight rate was $3.50, making $6.75 the cost to the retailers. They sold the coal for $14.50, which made a net profit of $7.75 a ton.

"Last winter I told the people that I would furnish them coal this winter at a reduced price. I am going to do this and I am probably the largest wholesale coal dealer in the State of Nebraska."

Mr. Bryan explained that he will not sell the coal at cost. "That would not be a good business proposition," he said.

## Bureaus Transferred July 1; Adivsory Committee Named

No formalities surrounded the transfer of the Bureau of Mines from the Interior Department to the Department of Commerce on July 1. Dorsey A. Lyon, acting director, on that day was an early caller at the office of the Secretary of Commerce, where Judge S. B. Davis, the Department's solicitor, is holding forth in the absence of Secretary Hoover and Assistant Secretary Drake. Judge Davis affixed his signature to the documents which require the approval of the Secretary at the beginning of the fiscal year and the Bureau of Mines became an integral part of the Department of Commerce.

The transfer of the mineral resources division of the Geological Survey to the Bureau of Mines was accompanied by an informal assembly of the personnel of the mineral resources division in the meeting room of the Bureau of Mines, where F. J. Katz, head of the division, introduced each member of his staff to Dr. Lyon. In welcoming them into the Bureau, Dr. Lyon expressed the thought that their work might become more interesting, as the division is made up of those accustomed to deal with economic phases of the industry, which now are to be emphasized.

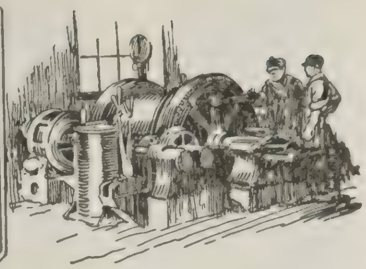
In the Bureau of Mines the title of the division will be that of "Mineral Resources and Statistics." Mr. Katz will report directly to the assistant to the director. This classification of the new division is temporary. There is no desire to make it permanent until the views of Secretary Hoover's advisory committee can be obtained.

Due to the absence of secretary Hoover there has been some delay in launching the work of the advisory committee, of which J. V. W. Reynders, the president of the American Institute of Mining & Metallurgical Engineers, is chairman. A meeting is imminent, however, as it is recognized as being highly desirable for the committee to be working in the absence of Secretary Hoover, so that its perfected recommendations may be laid before him on his return, about Aug. 1.

The American Mining Congress has named L. S. Cates, its president, as its representative on the committee. James F. Callbreath, secretary of the Congress, has been designated as his alternate. The National Coal Association has named J. G. Bradley to serve on the committee, while the United Mine Workers has selected Philip Murray. H. Foster Bain also is to be a member of the committee because of his intimate knowledge of the Bureau's work. As this is written, the other organizations which will be asked to designate members of the committee have not been determined upon finally.

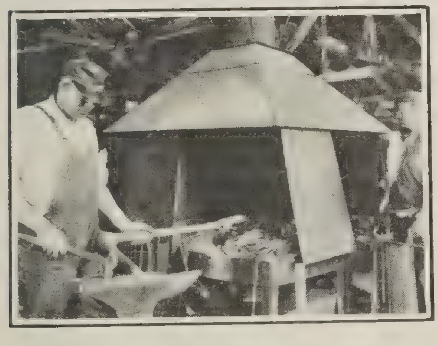
A first-aid contest was held July 1 at Ebensburg, Pa., for the championship of Cambria County with 24 teams participating. First prize was won by the Penelec Coal Corporation team, which averaged 99⅖ per cent for the five events. The prize was a huge silver trophy cup presented by Charles M. Schwab, of the Bethlehem Steel Co., controlling the Bethlehem Mines Corporation. The Monroe Coal Mining Co., of Revloc, won second honors with an average of 98 per cent, and third place went to No. 2 team from the Rich Hill Coal Mining Co., whose score was 97.33 per cent. The judges were state mine inspectors, including 10 past presidents of the Coal Mining Institute of America.

# Practical Pointers For Electrical And Mechanical Men



## Grouping of Forges Saves Space In Overcrowded Mine Shop

Many coal mine shops are more or less crowded and ample room in which the men may work is somewhat at a premium. Theoretically, a blacksmith with his forge and anvil should require a certain floor area in which to work, and this area cannot be reduced appreciably if efficient work is to be performed. As a matter of fact, forges may sometimes be arranged in such a way that the entire group may occupy less space than would its constituent elements if set singly. This is particularly true if the floor area available is approximately square.



**Four Forges Under One Hood**

Each blacksmith has his own forge but one hood serves the entire group. The fires are separate yet less floor space is required than if each forge was installed as a separate unit.

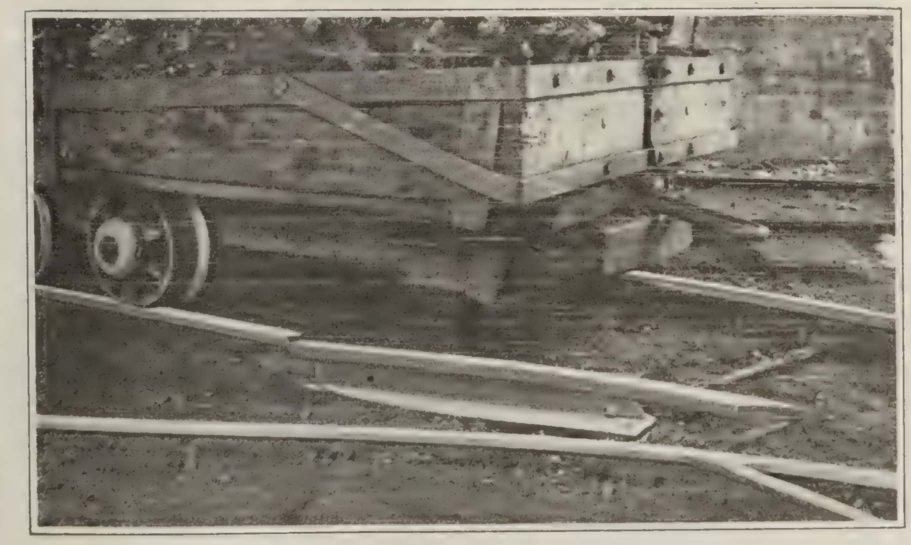
In the accompanying illustration made from a photograph taken in the shops of the Kingston Coal Co., Kingston, Pa., may be seen a group of four forges built up as a single unit and provided with a common hood. Four separate blowers are installed so that each fire may be controlled independently of all the others. Each smith stands at his own particular side of the grouped forges and in no wise interferes with the work of the others. To all intents and purposes his movements are as free and unhampered as if he had his own individual forge installed as a separate unit.

One interesting detail of this arrangement deserves special mention, namely, that the side plates extending from the smoke hood to the hearth frame are hinged at the top so that they may be folded up out of the way should a large or odd-shaped piece of work be encountered. This arrangement permits the heating of long pieces of straight or curved stock at a point near their middle, the heating of wagon or buggy tires and similar pieces preparatory to upsetting, and like jobs. It is, of course, possible to arrange a hood of this kind so that it can be raised and lowered, although the one here shown is stationary.

### Jump-Over Switch Serves at Mine for Ten Years

An old device which time has failed to displace is the jump-over switch or rail for use in place of a frog where it is an advantage to have minimum track friction and to have the two rails at slightly different elevations.

The photograph shows one of these switches which has been in service ten years at mine No. 2 of the Hazard Blue Grass Coal Corp., at Hazard, Ky. This switch is located about 20 ft. from the kick-back dump. The loads approach by gravity. The flange of the front wheel forces the jump-over rail into position thus providing a smooth crossing about 2 in. above the rail of the empty track. After the car has passed over, the switch is pulled back by a coil spring, thus clearing the rail of the empty track ready for the car as it is kicked back from the dump. Where the grade is naturally limited it is a distinct advantage to have the track friction minimized by the use of a continuous rail such as made possible by this device.



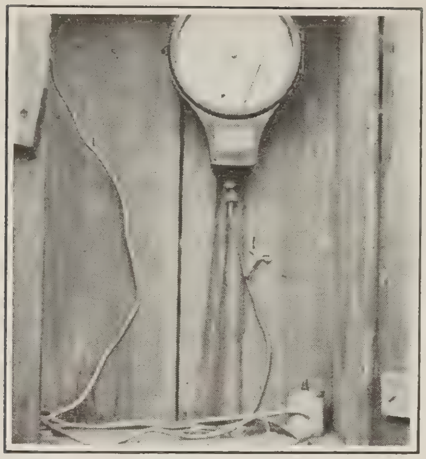
**Cross-over Switch Has Long Service Record**

Time has failed to bring about the replacement of this device by a better one. This jump-over switch has been in use ten years at mine No. 2 of the Hazard Blue Grass Coal Corp., at Hazard, Ky.

### Pumped Water Is Metered Over Glass Weir Lip

All the water pumped from the No. 2 shaft of the Susquehanna Collieries Co., near Williamstown, Pa., is metered. This is consistent with many other practices of obtaining accurate data on machinery employed by this company.

The interesting feature of the weir used at No. 2 shaft is the method by which accurate results are obtained for long periods. The edge of the weir is not a hardwood board; instead, it is a thick piece of plate glass with a beveled edge. Almost



**Meter Records Quantity of Water Pumped**

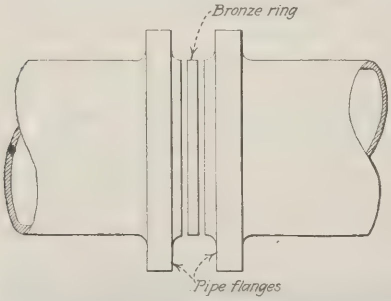
Accurate results are obtained by a 6-ft. glass weir lip. The chart indicates the volume of water raised during any period of the day.

any other material used for this purpose would require frequent replacement because of the gritty and acidulous nature of the water.

The accompanying illustration shows a meter connected to the measuring device. Thus daily records showing variations and the quantity of water raised are always obtained.

## Bronze Ring in Pipe Lines Gives Working Clearance

When long pipe lines are laid tightly together without some kind of spacing ring between the ends of the various sections it is always difficult to make a repair or change to the line.



**Ring Makes Repairs Easy**

Pipe sections are readily removed when spacing rings are placed at alternate joints.

At the mines of the Susquehanna Collieries Co. pipe lines are installed with a machine-faced bronze ring at alternate pipe joints. With this arrangement, a section of pipe can be removed or replaced easily. The rings are about ¼ in. thick and permit plenty of clearance whenever work must be done on the line.

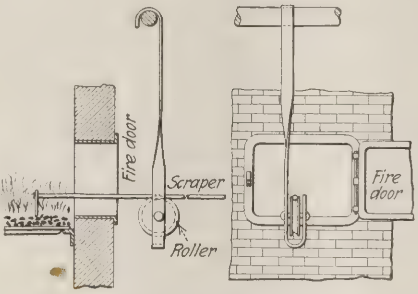
If the pipe stands vertically or nearly so it usually is difficult to remove a section if some clearance cannot be obtained. With a removable spacing ring at the joints, as described, sufficient clearance is easily obtained.

The ring is installed between two pieces of fabric which permit the joint to be pulled up tightly preventing leaks. The illustration shows how the material is assembled.

## Roller Rest Makes Fire Cleaning Easier

The long scraper used to level off or pull the fire under a hand-fired boiler is usually heavy enough to cause any fireman to feel tired at the end of the day if he uses it frequently.

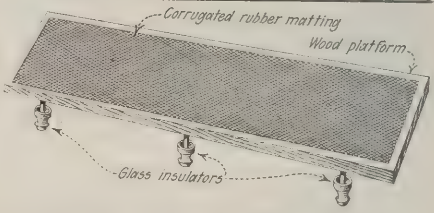
At the Shamokin power house of the Susquehanna Collieries Co. near Mount Carmel, Pa., one of the workmen has devised a rest for the scraper which makes its use much easier. This rest consists of an arm with a hook on one end and a roller on the other. The accompanying illustration shows how it is hung in front of the fire door. When the scraper is in service the fireman rests the long handle on the roller instead of dragging it on the bottom of the fire door.



**Reduces Fireman's Labor**

The scraper rod rests on the roller and thus the work of leveling the fire bed and cleaning the furnace is made much easier.

Incidentally this power house will soon be fired with pulverized fuel.



**This Platform Is Extra Safe**

Not being satisfied with the mere insulating qualities of rubber laid on a control-room floor, one coal company makes its switches safe to operate by the method here shown. Dirt and dust easily get ground into rubber matting.

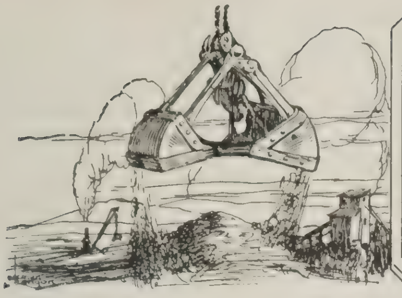
## Fan Exhaust Heats Water for Boilers and Wash House

At a mine of the O'Gara Coal Co. near Harrisburg, Ill., an unusual method of obtaining heated water for the wash house and boiler room, is employed. In the mine yard, not far from the power house and miners' wash room stands a large steam-driven mine fan.

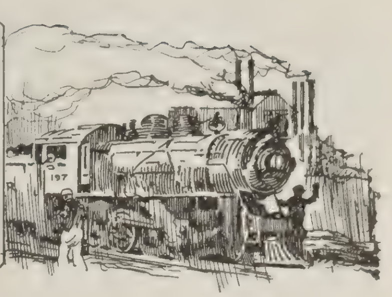
Like nearly all such units, this fan must be operated continually and therefore consumes a large quantity of steam. By means of special arrangements made at the fan, the exhaust steam pressure of the engine is sufficient to force the steam into a large heater which receives water of normal temperature. The heat energy of the exhaust steam warms the incoming water and raises its temperature sufficiently high to be used either as boiler feed water or for the wash room. The fact that this fan is so near the boiler house that the heat losses are low makes this method of heating water attractive.

**A Fan Designed to Save the Exhaust Heat Units**

Whether the mine is operating or idle the fan is one of the most important devices on the property. Usually, it must run continuously. This one is equipped with a water-heating tank which utilizes the heat in the exhaust steam.



# Production And the Market



## Bituminous Coal Market Is Brighter; Anthracite More Active

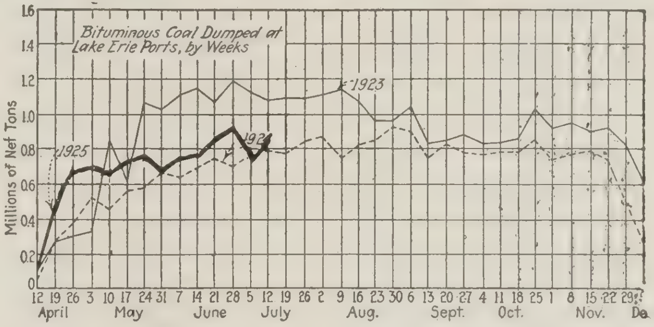
Despite the comparative sameness of day-to-day conditions in the soft-coal market, orders being scarce and prices floundering in the depths, the trade seems somewhat more cheerful. Some intrepid operators, in fact, have had the hardihood to announce an early advance in prices, among them Hazard (Ky.), Franklin County (Ill.) and West Virginia producers. These changes are expected to be reflected quickly in Indiana and Illinois coals, producers of which are preparing for an improvement. Meantime the trade is somewhat at a loss to understand the continued indifference of Midwestern consumers of steam coal. An interesting development of last week was the purchase of a large tonnage of 2-in. screenings at $1.55 by a strong Franklin County operator from a mine controlled by a large mail order concern, which was about to offer it to the stockyards at $1.50. This held the price fairly firm at $1.75.

Kentucky coal is moving somewhat better, but prices in western Kentucky are unsatisfactory, screenings selling as low as 90c. Eastern Kentucky, however, is maintaining better prices. Business at the head of the lakes continues quiet, awaiting developments. Receipts at the docks for the first six months of this year were nearly 1,500,000 tons above those of a similar period a year ago. On the other hand, shipments off the docks fell more than 4,000 cars short of those of the first six months of 1924. Conditions are practically unchanged in the Southwest, being somewhat duller in Utah.

At Cincinnati the firmer tendency in evidence a week ago has disappeared and the market finds itself in much the same condition as in late June. Domestic trade is picking up in southern Ohio and the steam trade is about normal. Little change for the better is in evidence in eastern Ohio and Pittsburgh. The New England and other Eastern markets are somewhat firmer.

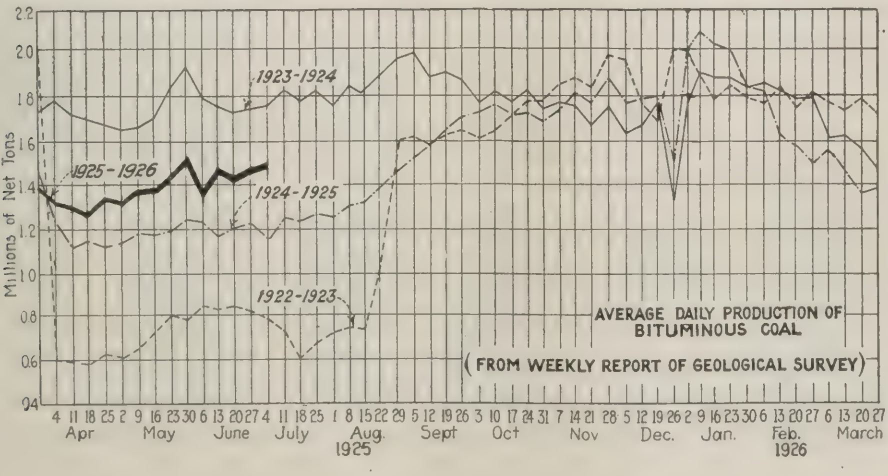
As expected, the anthracite market shows a marked increase in firmness as a result of the strike talk in the air. Demand is better and independent coal prices reflect a stronger tendency than a week ago. The upturn came none too soon, as some of the smaller mines were faced with the prospect of curtailing operations or suspending.

Bituminous coal output in the week ended July 4 is estimated by the Geological Survey at 7,381,000 net tons, compared with 8,671,000 tons in the preceding week and 5,913,000 tons in the corresponding week a year ago. Anthracite production in the week ended July 4 was 1,514,000 net tons, compared with 1,844,000 tons the week before and 1,296,000 tons in the same week last year.



*Coal Age* Index of spot prices of bituminous coal receded slightly during the week, standing on July 13 at 160, or $1.93, compared with $1.94 last week.

Dumpings at Lake Erie ports during the week ended July 12, according to the Ore & Coal Exchange, were: Cargo, 784,370 net tons; steamship fuel, 47,520 tons—a total of 831,890 net tons, compared with 780,300 tons in the preceding week. Hampton Roads dumpings in the week ended July 9 totaled 468,804 net tons.



### Estimates of Production

(Net Tons)

| | 1924 | 1925 |
|---|---|---|
| **BITUMINOUS** | | |

(*a*) Revised since last report. (*b*) Subject to revision. (*c*) Minus two days' production to equalize number of days in the two years.

### Midwest Anticipates Improvement

There are unmistakable signs that conditions will improve greatly in the Chicago coal market during the next thirty days to six weeks, and far-sighted coal men are already taking steps to provide for this market improvement.

The Franklin County operators have announced that effective Aug. 1 there will be an increase of 25c. a ton on domestic sizes and some of the big producers of West Virginia splint coal, who have lately begun to cut quite a figure in the Middle West, notified their trade to look for an increase on July 15. These people contemplate raising the price of 3-in. block from $2 to $2.25 and of 6-in. block from $2.25 to $2.50. The Hazard operators, who feature somewhat in the Chicago market, contemplated an increase as of July 15 from $2.30 to $2.45 on one grade and from $2.50 to $2.65 on another. This improvement in circular prices is going to make itself felt very quickly on Illinois and Indiana coals, as it will enable the producers of these coals to increase their prices as well. Smokeless operators are having no difficulty in maintaining a minimum price of $3 and it was confidently expected that before the middle of the month the price on good smokeless lump and egg would be $3.25, with mine-run somewhere around $2 to $2.15.

The situation on steam coals in the Chicago market is difficult to understand. It is pretty well known that Chicago industries have no large amount of tonnage in storage; nevertheless they maintain blithely that there is no need to bother about coal as there will be plenty. One mine in Franklin County, controlled by a mail order concern, had so much fine coal on track that it was going to offer a large tonnage of 2-in. screenings to the stockyards at $1.50. One of the stronger Franklin County operators heard of this and purchased the coal at $1.55, which kept the market on Franklin County screenings reasonably firm at $1.75. Industrial coals from Indiana, central Illinois and the Standard district continue to lag on the Chicago market. Some west Kentucky coal is being sold from day to day, but most of it at low prices. Those "in the know" are firmly of the belief that steam coals will advance with domestic sizes during the next thirty days.

The situation in the Williamson, Franklin County and Saline County fields remain unchanged. The tonnage of domestic sizes moving out is unusually small for this season. Steam sizes are moving fairly well and some mines are crushing coal to make screenings. There is a little railroad tonnage from the deep-shaft mines but the bulk of it seems to come from strip mines. The shaft mines are giving one and two days a week to those that are working, while the strip mines are working nearly every day and are shipping a lot of mine-run and some screen sizes, and are doing some crushing.

There is no change in the price situation although Frank-

**Coal Age Index of Spot Prices of Bituminous Coal F.O.B. Mines**

| | 1952 | | | 1924 |
|---|---|---|---|---|
| | July 13 | July 6 | June 29 | July 14 |
| Index | 160 | 160 | 160 | 162 |
| Weighted averaged price | $1.93 | $1.94 | $1.94 | $1.96 |

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States, weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and, second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke; 1913-1918," published by the Geological Survey and the War Industries Board.

lin County domestic sizes will be increased on Aug. 1 as per circulars mailed out this week. Lump and egg will be $3; No. 1 nut, $2.75. In the Duquoin field conditions are unchanged. A couple of mines are getting a few days a week and the others are idle, and every mine has "no bills" on track. In the Mount Olive field conditions are unusually quiet. A little railroad coal is moving out and some mine-run is being crushed. In the Standard district a few mines are working a little and they have a lot of unbilled coal on hand, except screenings, and there is no unusual demand for these.

The St. Louis retail trade continues quiet—practically nothing being delivered. The most noticeable decrease is in the higher grade coals such as anthracite, smokeless and Arkansas as well as coke. The higher grade Illinois coals are practically at a standstill and only the cheap coals are moving on summer apartment business, and this is going at a loss. There is no indication that the situation will show much improvement in the next few weeks. Wagon-load steam is unusually quiet and there is no real activity in carload steam. Country domestic continues quiet and country steam is difficult to find. There is no change in prices.

### Kentucky Movement Heavier

Louisville shippers report better inquiry, but no actual increase in business as a result of the threatened anthracite strike. General coal movement from Kentucky appears to be a trifle better than it had been. Western Kentucky has been offering a larger supply of screenings, but general prices are far from satisfactory. Screenings are reported selling as low as 90c., while the top on best block coal is said to be around $1.60.

Eastern Kentucky is getting a good movement and has been able to maintain screenings at $1, with best block at $2@$2.25, and specialty coals selling all the way from $2.25 to as high as $3. Steam coal is moving well as a result of industries and railroads being busy. Domestic coal is starting to move a little better and lake movement is the best that eastern Kentucky has ever handled.

It is reported that a good many eastern Kentucky mines are running full. Several companies in the Elkhorn fields are adding long strings of miners' houses and boarding houses, putting on more men, and increasing tonnages. Western Kentucky strip mines are reported at about capacity, but shaft mines are operating one to three days a week.

### Northwest Industrial Demand Not Dead

Trade at the head of the lakes is still dead, but there is some sign of life in industrial demand. Salesmen are being kept on the road, but are doing nothing but spot business. All are waiting for future developments in the mining business.

When bids were opened in Virginia, Minn., for 20,000 tons of splint screenings two of the dock companies and three local dealers all quoted at the market, $4. It is thought the contract will be divided.

A new schedule of rates between Kentucky mines and Wisconsin, Minnesota, Iowa and North and South Dakota which is to go into effect July 19 will raise the rate on Pocahontas into the Twin Cities and will give the docks the advantage of an additional 25c. a ton.

Prices are steady, with the exception of Pocohontas lump, which is now $7 at the dock.

Figures on shipments from the docks since the first of the year disclose that 95,214 cars went out during the first six months of this year, whereas last year 99,503 cars were shipped. In June 11,955 cars were shipped from the docks. This compares with 13,401 cars in June of last year and 12,302 cars in March of this year.

Forty-two cargoes were received at the local docks last week, as compared with 51 the week before. Of these, seven were hard coal. Eleven cargoes are reported on the way from lower lake ports, of which one is anthracite.

Receipts at the docks for the first six months of the year came to 1,420,556 tons above the first six months of 1924, according to figures of the District Engineer's office. There was an increase of 214,908 tons in hard coal and of 1,205,648 in soft coal. During last month 151,939 tons of hard coal and 1,295,190 tons of soft coal was received. This brings the total for the first six months to 537,317 tons of soft coal and 2,871,537 tons of soft coal, a grand total of 3,408,854 tons.

The coal trade in Milwaukee is a little better than it has been, but, considering the strike outlook at the hard-coal mines, the consumers in this section are rather apathetic. Dealers report from 30 to 50 per cent less coal in household bins at the present time than on the average in July. The docks are well supplied, but managers yearn for a demand that will make room for further receipts toward carrying them through the winter of 1925-26.

Receipts by cargo up to July 1 total 311,355 tons of anthracite and 805,018 tons of bituminous coal—an aggregate of 1,116,373 tons. Up to the same date of 1924 the receipts were 281,138 tons of anthracite and 586,612 tons of bituminous coal—867,750 tons in all. Receipts for July of this year, up to the 9th, total 94,546 tons—18,500 tons of anthracite and 76,046 tons of bituminous coal. All-rail receipts at Milwaukee during June were 4,320 tons of anthracite and 29,855 tons of bituminous coal.

### Southwest Prepares for Livelier Market

Conditions in the Southwest have changed little since last week. There is a light threshing and school demand, but activity is increasing in the field in preparation for the livelier market expected the latter part of this month and next. There has been no change in the Kansas shaft-coal market, but that for Kansas shovel is a little firmer at $3@$3.50 for lump, $3@$3.25 for nut, and $2.50 for screenings and crushed mine-run, the same price as is asked for shaft screenings.

Conditions are unchanged in the Colorado coal business. Mines are operating about two days a week. The operators do not look forward to any change for the better until the last week in July in preparation for abnormal movement on account of the rate reductions which go into effect Aug. 4. Prices have undergone no change.

The Utah trade describes the coal market as a little duller than it has been at this time of the year for some time. This is explained by the fact that no storage rates have been offered this year. Everyone is still convinced that storage rates are not worth while. Industrials outside of the mines and smelters are taking very little coal. Leading operators say they are producing just about enough slack to supply the demand. Dealers other than the mine-owned yards are taking no storage coal. There are quite a few "no-bill" cars on the tracks, consisting of larger sizes of coal. Working time is around two days a week. The labor and car situations are good.

### Cincinnati Situation Puzzling

The Cincinnati market continues to have difficulty in getting its bearings. Mine-run, which showed signs of strength, after an advance of 10c.@15c. has fallen back almost to the status of the last week in June. Domestic is still in the ruck, and while slack still holds at $1.10@$1.15 it does not carry with it the assurance it did last week.

The tonnage movement continues steady and strong, though some embargoes have been imposed by the Baltimore & Ohio against Toledo shipments, but this has caused no tremendous backing up of loads. Country dealers and retailers have by no means responded to the anthracite situation.

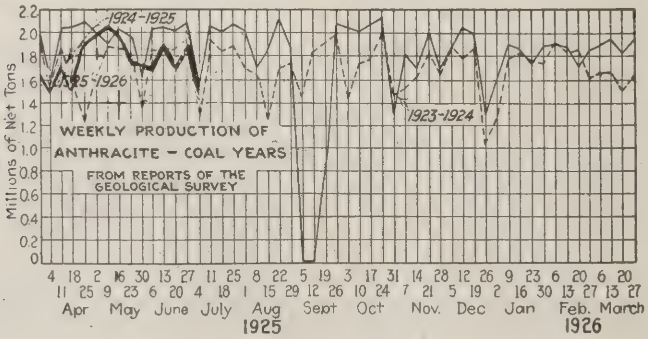
In smokeless the situation is much the same. Only one firm is quoting July deliveries of lump at $2.75, the rest of the standard people making the basis $3. Egg is getting most of the attention, being quoted $2.25@$2.50, with nut at $2.25. Mine-run jogs along with a slightly better feeling; there are practically no $1.75 quotations, most of the New River and Pocahontas firms holding for $2. Screenings have dropped back to $1.25.

Heavy rains have interfered with barge movement on the river but are a blessing in that they will hold the water to a level that will permit free movement for some time. The movement is running here and down-the-river ports to 12,000 to 15,000 tons a week.

### Domestic Trade Increasing at Columbus

At Columbus domestic trade is showing more activity in all directions and producers as well as wholesalers believe that domestic trade will show a considerable increase during the remainder of July. Retailers are beginning to be anxious as to stocks, which are low. Strength is appearing in many lines of domestic coal, particularly in smokeless and splints. Advances in prices are looked for around the middle of the month.

Steam trade is about normal with only a few contracts being made. The larger consumers are still content to buy on the open market rather than enter into agreements, but with reserves rapidly decreasing it is believed that better buying will develop soon. Railroads are taking a considerable tonnage and public utilities also are good buyers. School coal is moving and proposals for tonnage for municipalities and public institutions are being asked for. Country dealers are placing small orders to take care of the threshing trade in farming sections. On the whole the steam trade shows a better tone although the volume of business has not increased to any marked degree. It is believed that the worst of the slump is over, however, and that August will show much better business in every way. Lake trade is progressing satisfactorily with some tonnage going from Ohio mines. Railroads leading to the lower lake ports are crowded with coal trains.



Production in the Pomeroy field has increased owing to the opening of additional mines on the 1917 wage scale.

The eastern Ohio market, so far as demand is concerned, has suffered another sinking spell and activity in orders or inquiries is almost totally absent. Lagging industry, coupled with hand to mouth buying for current needs only has exerted undue pressure upon market tone, and this is keenly felt in view of the small tonnage being shipped from Ohio mines in the Lake trade.

However, slow demand has in no wise affected spot prices, as operators are unable to cut any further. Competition is keen with stripping coal and non-union coal from the South in most all the industrial centers, but prices in many instances are already below the actual cost of production at Ohio mines under the union wage scale. Slack and screenings are scarce and the spot prices thereon are 5c. per ton higher than a week ago. This is due to the small amount of these grades being produced.

The week ending July 4 witnessed the lowest production in this field of any week in several years. Total output was only 183,000 tons for the five workdays, or about 31 per cent of potential capacity.

### Prospects Brighter at Pittsburgh

The Pittsburgh coal market is described in some quarters as quieter still but this is regarded as practically impossible. There is no open market inquiry of any consequence except for slack, and occasionally for gas nut. Other business is done between consumers and their regular sources of supply with but little negotiating, prices having long ago been shaken out so thoroughly that there is little to talk about. General prospects as to consumption of coal have improved. The steel industry has had scarcely more than half as much decrease in production since the March peak as occurred a year ago.

Another week has passed without any definite developments as to mines in the district reopening at a reduction from the union scale, and there is no sign that anything along this line will occur in the near future.

The Buffalo market is weak and unsteady, some offices having closed because they cannot be maintained at a profit. There is not quite as much complaint of West Virginia encroachment as there was. Certain Allegheny Valley and other Pennsylvania operators, who have lately started up under reduced miners' wages, say that they can compete with West Virginia and in fact they are obliged to if they would stay in business.

The Canadian trade is not in good condition. So many complications have come up that the expected advantage from the giving up of the freight-prepayment rule has about been lost. There is no change in the price situation.

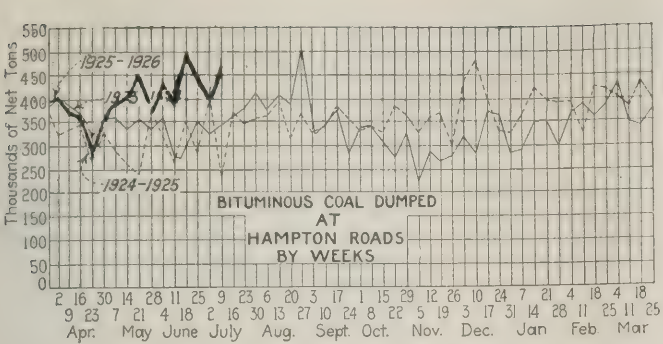
As a result of the predictions of an anthracite strike in the fall, Toronto householders have been laying in large stocks of coal, dealers having been literally swamped with orders for the past two weeks. With the exception of stove coal, supplies are plentiful, and there is little difficulty in filling orders. Prices remain unchanged, as follows: Anthracite, $15; Welsh anthracite, $16.50; Pennsylvania smokeless, $5.85; steam lump, $6.40; slack, $5.60; coke, $12.

### Firmer Front in New England

The trade in New England has the impression the market is in rather better form than had been the case for several weeks. Less coal appears to be sent forward to the piers on consignment, and while no new buying has materialized there seem fewer soft spots than have been characteristic hitherto. Perhaps part of the reduced output is because of the holiday, but several of the Hampton Roads agencies appear to have adopted a firmer attitude toward sales at less than the $4.25@$4.40 range that is their present aim.

Only scattering inquiry has developed thus far for spot coal f.o.b. vessels at Norfolk and Newport News for coastwise delivery. Volume shipments are confined to contracts, and there are no indications now of further contract tonnage being closed for the next few weeks.

On cars at Mystic Wharf, Boston, as well as at Providence and Portland the situation is somewhat better in hand, but there are still openings for the purchase of either spot coal or for deliveries through September and October at levels that are about the same as those that have prevailed since early spring. A range of $5.20@$5.25 is by no means impossible, especially at Boston, but among the smaller shippers there is a more determined effort to



realize \$5.30@\$5.35. While \$5.40 is mentioned we have heard of no actual sale at this figure, unless possibly for extremely small tonnages.

There also is a firmer attitude on the part of retail dealers in this territory, who up to July 1 seemed to throw caution to the winds in their desire to place coal in anticipation of constant arrivals on seasonal arrangements. It is understood that \$7.50 per net ton delivered is the present retail basis in Boston, although a large proportion of the year's tonnage was definitely sold on a much lower level.

On Pennsylvania coals all-rail there is no news. The situation drags along with no relief in sight. A few large shippers are struggling to increase output with a view to reducing overhead, but on present mining costs orders come hard.

### Freer Movement at New York

Bituminous coal users at New York are watching developments in the hard-coal situation, wondering how long the expected suspension will last and to what extent it will affect the soft-coal industry.

There is a freer movement of coal, but no changes in prices, so far as classified coals are concerned. Quality coals frequently are offered at from 15c. to 20c. below current quotations for the better grades, while individual producers of the best grades frequently quote 10c. higher than the maximum market quotations for those classes of coal.

Buyers here are not anxious to increase their standing orders. Contract coals are moving freely, but free coals are hard to move unless an attractive offer is made. There is very little of Pool 1 coal offered at the local tidewater piers.

At Philadelphia the looked-for improvement after July 1 is slow to present itself. There are days now when improvement is noticeable, but it quickly vanishes. It does seem at times as if the moderate buyer is beginning to look to his supplies and is ordering somewhat better than ordinarily. Stockpiles around all plants, except the utilities, however, are meager for this season.

Even if there is a hard-coal suspension it will take a long time to affect soft coal, as the anthracite companies have millions of tons in storage. The threat of a general strike, including soft coal, is looked upon as mere talk.

Tide conditions are unchanged. The only expectation of better business lies in the direction of bunkering.

The soft-coal industry at Baltimore is largely living for the future. There are promising signs for the near future in the home field and a strong expectation that the export and bunker business is due for an increase. The expectations of improvement are based on expected troubles in the coal fields here and in Great Britain.

### Birmingham Market Featureless

The Birmingham market is devoid of any features of special interest. Inquiry for spot domestic is said to be slightly better than it was in June; more coal is moving on contracts and mines are managing to book enough business to move the surplus high-grade coals without unreasonable delay, but much solicitation is required.

Steam demand is just about as it has been for some weeks as a whole. Some agents and brokers report inquiry as showing a little strength as compared with last month, and production records would seem to indicate a slight gain in movement of commercial coal, but buying for the most part is still on a hand-to-mouth basis. Prospects are said to be good for further displacement of oil in favor of coal on the part of industries in this territory. There is no change in bunker trade, consumption in this direction being about normal for the season. Prices are unchanged.

### Strike Gossip Stiffens Anthracite

Strike talk has strengthened the anthracite market at New York. Demand has increased and independent coals are bringing better prices than last week. Preparations are under way for increasing the quantity of Welsh coal imported into this market by the establishment of agencies with local houses. It is believed that the coal can be delivered at prices below those charged for Pennsylvania anthracite.

Operators of small mines admit that if market conditions had not improved during the last week or ten days they would have been obliged either to curtail output or suspend operations entirely

Stove is the size most asked for and egg is in fair shape. Chestnut continues to drag along, with pea coal increasing in demand, especially along the line. Rice and barley are being stocked in large quantities by the smaller operators. No. 1 buckwheat is in fair condition.

The Philadelphia hard-coal situation fails to improve, and the retail trade is just dragging along. There is some increase of buying due to the strike threat, but it is far less than was expected. Retail dealers seem more inclined to buy, although their difficulty is to find room for additional coal. Occasionally blocks of pea and nut sell a little off price, but as a rule operators are shutting down for a day or two rather than cut prices. Of course, company producers are holding to their schedules.

Pea has become draggy during the past week and chestnut is at its heels. Stove is in strongest demand. Egg is moving only fairly well. Steam sizes are troublesome and the independents are willing to take a cut on both buckwheat and rice to move them. Barley is perhaps in better demand.

Although the air is full of rumors regarding the likelihood of a strike in the anthracite regions there is no general response from Baltimore consumers in the matter of storing against the needs of the coming fall and winter. There are some exceptions, such as the award of a contract by the city for 6,000 tons of hard coal for immediate delivery. Consumers seem to wait until the last minute before ordering, and this condition has become more pronounced with each raise in the price.

The Buffalo anthracite trade is about as quiet as it ever is at this time of the year. As a rule consumers are not paying much attention to the prospect of a fall strike, which a good many people regard as pretty certain to take place.

The coke trade has not shown much life lately and it will be quiet till the fall coolness starts the house furnaces up. Then, if prices remain as low as they are, the trade ought to show a good activity.

The lake trade is quiet. For June the shipments were only 296,400 tons, as against 383,900 tons in June last season, and for the season to July the shipments were 986,964 tons, as against 854,000 tons to the same date last season.

### Connellsville Coke Market Drags

The Connellsville coke trade is not at a settled gait until improvement comes in the iron trade. There have been no developments in the past week and there can hardly be any in the future, until some change occurs in the position of consumers. Most of the blast furnaces that use purchased Connellsville coke are out and those now in will certainly stay.

Contract furnace coke remains nominal at \$3@\$3.25, there being no negotiations. Spot furnace coke remains at \$2.75@\$2.85, on the basis of small lot buying by non-metallurgical consumers.

Spot foundry coke is moving slowly, at \$3.75@\$4.25 as the general range, hitherto quoted, but with sales chiefly at \$3.75@\$4. There hardly will be more activity until foundry operations increase.

# Foreign Market And Export News

## British Coal Market Still Dull Despite Possible Tie-Up

Events appear to be moving rather rapidly in the Welsh coal industry. At the end of June the employers gave notice of the termination of the national wage agreement with the miners on July 31. Therefore South Wales has entered an anxious period, and although for several weeks past conditions have been very depressed and trade has not shown any revival, much may happen in the course of the next month.

A rise to the highest point for eighteen months in South American freight rates impedes business in this direction and, with growing stocks and consequent tying up of rolling stock, the collieries are working irregularly. The low level of the lira and franc contribute to making a negligible new inquiry from France and Italy. Spain is the busiest spot at the moment, although buying is below the average. Coaling depots are holding off.

The Newcastle coal trade was not upset so much as usual by the race week holidays, there being little to upset. In the coal fields there was less dislocation, too, as so many miners are idle in any case. Pits continue to close down, and though two of the big groups which were expected to suspend have been able to carry on it is only on a day-to-day notice system. Prices on all grades are substantially unchanged, but in no case is there a testing in the market. Inquiries are scarce and mainly on account of small Continental gas concerns for small parcels.

Output by British collieries in the week ended June 27, a cable to *Coal Age* states, totaled 4,420,000 tons, compared with 4,465,000 tons in the preceding week.

### Hampton Roads Trade Reacts To Strike Rumors

Business at Hampton Roads last week began to react slightly to rumors of the impending strike. The trade was reluctant to sell in advance of twenty days deliveries, although mines in this territory were not increasing their production in anticipation of a possible walkout.

Strike rumors had not served to strengthen prices, however. Some fairly heavy foreign movement took place during the week, but was regarded as simply a flurry which frequently occurs. The tone of the market was fairly strong.

### Industrial Demand Subnormal In French Market

The French coal market is weaker. Demand from power plants, metallurgical works, certain branches of the textile industry and glass works are below normal. Sugar factories alone seem decided upon increasing their orders, in view of the autumn campaign. Owing to these conditions, prices for industrial coals, although not officially changed, are subject to concessions. Foreign competition also obliges French collieries to show some conciliation, in order not to lose business.

Import licenses on German fuels have not yet been re-established and the Nord, Etat and Orleans railways have objected to granting reduced freight tariffs from the Nord and Pas-de-Calais to the Western region. The Orleans and Midi railways, however, have agreed to make concessions for the transport of coal from the center region toward Bordeaux and the ocean side.

The coal output in May was 3,829,000 tons for twenty-four working days, against 3,919,000 tons in April for twenty-five working days. The daily output in May was 159,530 tons for 310,686 persons employed, as against 156,760 tons in April for 312,381 persons employed, and 136,147 tons, the 1913 monthly average for 203,208 persons employed.

The May coke output was 255,000 tons, which means that for the first time the prewar average of 245,000 tons in 1913 has been exceeded. It should be noted that the mines in northern France, which were wrecked when flooded by the Germans during the war, are now producing more than before the war. The daily output of such mines is 95,000 tons, which is 3,708 tons greater than the daily average in 1913.

# News Items From Field and Trade

## ALABAMA

Judge Elbert H. Gary, chairman of the board of directors of the United States Steel Corporation, is scheduled to arrive in Birmingham this week for a visit of several weeks. Developments of importance are expected to follow his trip, which will be his third trip to the district in the past three months, during which he has closely inspected the properties of the Tennessee Coal, Iron & Railroad Co. and its subsidiaries.

The Alabama By-Products Corporation, Birmingham, has been awarded an order for a large amount of coal to be consumed by the American Sugar Refining Co. in the New Orleans territory, replacing oil in the Louisiana sugar fields it is announced. The contract will require approximately 700 tons per day, which will be shipped from the Alabama fields by the Warrior River barge line.

The Woodward Iron Co., Woodward, of which Frank H. Crockard is president, is sinking a shaft, air shaft and slope at the new Crockard mine, near Mulga. Dormitories and a dining hall are under construction and hoisting and power house, boiler house, machine shop and blacksmith shop are to be built. The mine will be served by a 4½-mile switch, now under construction, and the output will go to the washery at Woodward, to be manufactured into coke for use in the manufacture of pig iron for the company.

The State Board of Mine Examiners will hold its mid-year session in the offices of Chief Mine Inspectator Charles H. Nesbitt July 27-30 for the consideration of applications for certificates of competency to hold positions as mine foremen and firebosses in Alabama coal mines. These examinations are held semi-annually in January and July.

## ARKANSAS

Mines of the Fort Smith-Spadra Coal Co. are now operating on a union basis, according to William Pendergrast, manager. Recently the management announced that the 1917 wage scale would be adopted and an explanation of the recent change was refused. The mines are said to be running at practically normal capacity since the readoption of the 1924 contract. Previously miners in the local field and from Denning picketed the mines and paraded in automobiles in the streets of Alix, Denning and Altus. Four mines are running open shop in the union field and it is reported union miners are attempting reorganization of these mines under the 1924 wage agreement.

## COLORADO

The State Industrial Commission on June 30 handed down an award allowing the Leyden Coal Co., operating mines in Jefferson County, to reduce the wages of its miners to the 1919 scale, amounting to a cut of 20 per cent. The company, along with numerous other companies operating in the northern Colorado field, had asked permission to reduce to the 1917 scale—about a 30 per cent cut. The miners protested and the matter went to hearing before the commission. The award is identical with those made in ten other cases in the northern field.

Colorado coal mines produced 604,393 tons in May and 3,943,374 tons during the first five months of this year, according to the monthly report of James Dalrymple, state coal mine inspector. The report shows that for the first five months of 1925 there has been a decrease in coal production in Colorado from the figure for the same period of 1924, which was 4,403,647, or a decline for 1925 of 460,273 tons. In May, Las Animas County led in coal output with a total of 243,832 tons.

## ILLINOIS

The Scott-Smith Coal Co., of St. Louis, operating a large strip mine at Duquoin, has sold its entire holdings to a number of business men of Duquoin, headed by James McSherry. The mine was owned by E. J. and Thomas Scott, both of St. Louis, and was managed by M. D. Maguire, of Duquoin.

The Nason Coal Co. is operating its mine at Nason full time, producing about two thousand tons of coal per day. The payroll is running from $40,000 to $50,000 every two weeks. The company recently received the contract for supplying the city of Woodstock with coal after that city had completed the chemical analysis of the coals of the four lowest competitive bidders.

Edwin H. Conrades has resigned as president of the Merchants and Manufacturers Investment Co., holding company for the Donk Brothers properties. He has been succeeded by Erle S. Ormsby, who was vice-president. It is understood that the holding company is to dissolve and that the stockholders will exchange their holdings for Donk Brothers Coal & Coke Co. stock, share for share. The holding company, capitalized at $1,000,000, was formed to handle the various Donk Brothers properties, which included approximately 30,000 acres and three railroads. The railroads were sold several months ago. The stock of the Donk Brothers Coal & Coke Co. is said to have a book value of approximately $325 a share.

The Chicago, Wilmington & Franklin Coal Co. has announced plans for opening Orient Mine No. 1, at Orient, for the balance of the year. The mine, one of the biggest producers in the state, has been closed down for a month or six weeks.

A. D. Lewis, formerly assistant director of the State Department of Mines and Minerals of Illinois, has been named as director, succeeding Martin Bolt, who died June 23. Governor Small made the appointment on July 3. Mr. Lewis is a brother of John L. Lewis, president of the United Mine Workers.

The Astoria Fuel Co., Astoria, has resumed mining operations. This is known as the Bucher mine.

The Fairbury Coal Co., Fairbury, operating the west mine at that town, has abandoned the workings to the north of the shaft on account of bad roof and low grade of coal and is now driving entries to the southwest into a field where the roof is good and a satisfactory grade of coal obtained. Rooms are being provided for about twenty miners.

A. W. Hinkle has sold his mine near Astoria to John Wherley and Charles Butler, for a consideration of $3,500.

After being unused for several years, the coal mine at Rutland has been leased for a year by August Calvetti and Veness Copp, who will soon place the property in a workable condition.

Mathew O'Donnell will open a new mine on his farm near St. Augustine, where a 4-ft. bed of coal is located only 30 ft. below the surface. Coal was mined there many years ago. This will make the sixth mine to be operated in the vicinity of St. Augustine.

## INDIANA

The Bickett & Shirkie Coal Co., of Terre Haute, has filed a certificate of dissolution with the Secretary of State.

The contract for providing the city schools of Indianapolis with coal for the coming winter, entailing an expenditure of nearly $100,000, has been awarded to the Peoples Coal & Cement Co., of Indianapolis, and the Indianapolis Coal Co. on a joint bid of $5.37

for West Virginia coal. The Allied Coal Co. received the contract for 9,018 tons of Indiana lump at $4.18 and 8,488 tons of screenings at $3.48.

Coal mines in Sullivan County, many of them down since April, are gradually resuming work, and prospects are bright for increased activity in the field. Peerless, one of the best mines in the county, is at work again. Baker mine may start working in the next ten days. Ebbw Vale mine and the mine of the City Coal Co. are working and some of the shafts of the Vandalia Coal Co. are working part time. Glendora and Reliance mines have been working a few days each week all summer and their schedule will be increased soon.

### IOWA

The Pearson Coal Co. has struck a good bed of coal at a depth of 45 ft. at the new coal mine which the company is sinking near Hawleyville.

### KANSAS

The appointment of four members to the State Mine Examining Board was announced by Governor Paulen, July 6. R. A. Gray and Fred Kempster, both of Pittsburg, were reappointed. William Devlin, of Scammon, and John B. Fulton, of Frontenac, will be new members of the board. At a meeting of the four appointees in Pittsburg, July 8, Prof. J. A. Yates, of the State Teachers' College, at Pittsburg, was selected as the fifth member of the board. This will be the fifth year Professor Yates has served in this capacity. Mr. Gray and Mr. Fulton represent the operators, Mr. Kempster and Mr. Devlin, the miners. The first examination by the new board will be in Pittsburg July 18.

J. S. Patton, who has a lease on the Hamilton Coal Co. mine No. 7, near Frontenac, has announced the mine will reopen on a co-operative basis. Every worker in the mine, which ordinarily employs eighty men, will be expected to buy shares in the company, with a maximum of ten shares, par value $100 each, to a man. Each purchaser will be required to pay cash for one share, 25 per cent of his net earnings to be deducted each month until the remainder of his allotment is paid for. In the lease are included 850 acres of coal land. Matt L. Walters, president of district 14, United Mine Workers, has announced that district officers will not sanction the plan.

The Verdigris River Coal Co., controlled by Eastern capital, has obtained options on approximately 31,100 acres of coal lands about four miles southwest of Independent. The coal bed is down about 800 ft. and is thick and of good quality.

The Western Coal & Mining Co., it is reported, will within 30 days begin sinking shafts for two large mines. One will be near Arma in Crawford County while the other will be at Minden, Mo., just across the state line. The former will employ 350 men and the latter 250 after development, but it will be some time next year before the workings are far enough advanced to employ a large force of men. The Western now has seven mines working in this field but two or three of them are using only small shifts and will be worked out by the first of the year.

Mine No. 20 of the Western Coal & Mining Company near Arma, set a new production record for the Kansas field on June 30, when it loaded 1,553 tons of coal. The previous record was 1,529 tons, by the same mine, about a year ago.

The Jackson-Walker Coal & Mining Co. has leased its No. 17 mine, a large shaft near Frontenac, to James Murphy and Samuel Thornberg. The lease is for ten years. Improvements costing $3,000 will be made before the mine is started, late in July. It had been idle since April 1. The new firm will place its coal on the local markets. Leasing this mine leaves the Jackson-Walker without a mine to be operated by itself, all the mines controlled by the company being leased.

### KENTUCKY

Joseph Briscoe, receiver for the Stevens Branch Coal Co., of Alphoretta, has received permission of Judge A. M. J. Cochran of the U. S. District Court for eastern Kentucky to lease this property to a company which will be incorporated under the Kentucky laws and will be composed of gentlemen from that state.

Reports from Pineville and other eastern Kentucky sections show that there has been some interruption to coal mining since July 1 on account of heavy rains and electrical storms, some mines having been flooded as a result of cloudbursts sweeping down valleys, while power lines have been down and in trouble as a result of lightning striking them.

Bloodhounds were responsible for the capture of Howard Childress, charged with an attempt to burn the tipple of the Mary Helen Coal Co., in Harlan County. Officers had to fire into a shack in which he had taken refuge, before he gave himself up.

C. W. Fleming, president of the Elkhorn Coal Corporation, of New York, recently announced at Fleming that his company had let contracts for fifty additional miners' homes at the Wheelwright plant of the company and was considering as many more at the Hemphill mines. Carpenters are now at work on 100 new miners' homes at McRoberts, for the Consolidation Coal Co.

All of the property of the Alma-Thacker Coal Co., which had headquarters in Columbus and which operated three large mines in Pike County, Kentucky, was purchased at receivers' sale June 15 by Attorney D. N. Postlewaite, of Columbus, representing a syndicate which probably will take over the mines and start operations. The property consists of modern equipment for three mines, 100 acres held in fee simple and a lease on approximately 3,000 acres more. The company went into the hands of receivers about a year ago when Robert L. Laylin, of Columbus, and Glenn Deaton, of Kentucky, were named receivers. Mr. Postlewaite bought in the property for $5,000 subject to the approval of the federal court in Kentucky.

Fred G. Hatton, president of Hatton, Brown & Co., Inc., receiver for the Himler Coal Co. of Himlerville, Ky., announces that production at the mines is being steadily increased. Judge Hough, in the federal court at Columbus, ordered the mines to resume operations soon after the receiver was named. About 200 men are employed and it is hoped to have the tonnage brought up to about 1,600 daily soon. The company holds about 3,000 acres of coal lands on a lease. A portion of the tonnage produced is going into the lake trade.

### MISSOURI

The sinking of the shaft at the new coal mine on the Watson Brothers farm, south of Richmond, is again under way after delays due to water. All the water has been pumped out and work resumed. The shaft is now down about 50 ft. It is thought the shaft will have to be sunk about 80 ft. No more trouble is expected from water.

C. H. Krause, vice-president and treasurer of the Willis Coal & Mining Co., of St. Louis, Mo., states that the *Coal Age* report of June 25th that his company had gone into voluntary bankruptcy was incorrect. Instead, the action was an equity receivership brought about by some of the stockholders and creditors of the company for the purpose of protection and conservation of the property "during this time, when the entire coal business in Illinois has been having hard times to contend with."

### MONTANA

Steps are being taken for the formation of the Montana East Belt Coal Co., to operate a property near Great Falls. The trustees will be Edward Reese, George D. Ayers and H. N. Stockett. "The coal is almost anthracite and the best left in the Northwest," said Mr. Reese. "It lies flat and in a property having an area of 1,500 acres. The three coal seams are 6 to 18 ft. thick and separated by streaks of slate an inch thick. The covering is sandstone and the base is fireclay. The covering is 400 ft. in thickness. The coal is above the water level and has been entered by seven tunnels. The Great Northern Ry. and the Anaconda Copper Mining Co. have mined in the district for many years."

### NEW YORK

Percy E. Barbour has announced his resignation as assistant secretary of the Mining Institute of Mining and Metallurgical Engineers and as editor of *Mining and Metallurgy*.

Creditors of the New York & Brooklyn Fuel Co., of 113 Ninth Street, Brooklyn, protested last week to Bankruptcy Referee McDonald in Brooklyn against accepting the $800,000 bid of

Courtesy Bertha-Consumers Co.

**Playground at Rachel Mine**

The Bertha-Consumers Co. does its part in keeping the younger element contented, as is attested by the playground at its Rachel mine, at Rachel, W. Va. Slides, swings and other amusement features are provided. The building in the background is a school maintained by the company.

the Lee Coal Co., of Wilkes-Barre, Pa., and 17 Battery Place, Manhattan, for the company's plant and the $8,000 offer of R. M. Egan & Co., Inc., of 1 Broadway, Manhattan, for 2,000 tons of coal in the plant.

On account of the Maher Collieries Co., of Cleveland, going into a combination, the Buffalo office, opened several years ago by O. E. Southard as resident manager, closed July 15. Mr. Southard may continue the business on his own account.

## OHIO

The attitude of public officials in the Pomeroy field, where the labor situation has been intense recently due to the reopening of several mines and efforts of United Mine Workers officials to call the men out, is strikingly shown in the action taken by Meigs County, O., commissioners, who, July 9, appropriated $2,000 to take care of the salaries of deputy sheriffs appointed to guard properties of the Pittsburgh Coal Co., the Statler Essex Co. and the Great Lakes Mining Co. A tipple of the Pittsburgh Coal Co. was burned in that district more than a week ago.

Armed guards are patroling the substations of the Southern Ohio Power Co., which furnishes electrical energy for the Pomeroy district, following recent disorders between union and nonunion coal mining factions. All undergrowth has been cut away for a considerable distance around the property and powerful lights have been set up on the premises. The company furnishes power to all the mines and other business enterprises.

## PENNSYLVANIA

Lightning on July 10 struck the coal tipple of Montour mine No. 9 of the Pittsburgh Coal Co., 2½ miles northwest of McDonald, and set it on fire. Firemen were unable to check the blaze and the tipple was destroyed with a loss of $100,000. The building was equipped with the most modern machinery, having been built in 1917. It served two shafts. The tipple was more than 500 feet long.

The biennial convention of District 1, United Mine Workers, will be held July 20 in the Wilkes-Barre Y. M. C. A.

Mine No. 2 of the Rosedale Coal Co., located at Poland, the tipple of which was burned several weeks ago, resumed operations on July 7, and on a nonunion basis. Over 50 miners have been employed by the company and loading at the outset was at the rate of about 400 tons a day. It is stated by officials of the company, however, that the mine will be operating in full within a year. When running to capacity the Poland mine has a daily output of about 1,000 tons and employs about 150 men. The mine of the same company at Morgantown, on Scotts Run, is being operated on a full-time basis and independent of any agreement with the union.

As was expected, the board of directors of the Lehigh Valley Coal Co. at its meeting June 30 declared a dividend of $1.25 per share on the certificates of interest in the capital stock to be distributed by the trustees on Aug. 1 to certificate holders of record on July 11, 1925, who have filed affidavit of non-ownership of Lehigh Valley Railroad Co. stock, as provided in the final decree of the U. S. District Court, Southern District of New York, dated Nov. 7, 1923.

The Reading Co. during the month of May, 1925, transported 1,324,784 tons of bituminous coal as compared to 1,285,587 tons in May, 1924.

A public statement that probably will bring an end to the factional disputes in progress for months at the Woodward colliery in Edwardsville of the Glen Alden Coal Co. has been issued by John L. Lewis, international president of the United Mine Workers. Mr. Lewis has declared that local union 1145, Woodward colliery, headed by Adam Dunn, has "the full co-operation of the international organization while it complies with our constitution and contract."

The Ruth Coal Co., of Natrona, has gone into bankruptcy. The first meeting of creditors has been called for July 21. The schedules show assets of $16,340 and liabilities of $29,672.94.

## UTAH

E. E. Jones, superintendent; Joseph Parmley, chief clerk of the Utah Fuel Co. at Castlegate, and other employees of the company in Carbon County, together with a number of other men were on June 30 released from the Carbon County jail on heavy bond to stand trial in connection with the lynching of a negro murderer near Price some weeks ago. The trial is expected to come up in the fall. The men will be charged with first degree murder. The negro's crime was of a particularly savage character and the accused are heroes in the county.

## WEST VIRGINIA

Belief is expressed here that something definite will develop in the $100,000,000 coal merger in northern West Virginia within a short time. Fairmont representatives of the merger interests have been summoned to New York City. It is reported that 60 coal companies in Harrison, Marion and Monongalia counties are interested in the merger.

In the first six months of this year the coal mines of northern West Virginia loaded 9,341,250 net tons compared to 10,205,050 tons in 1924, 14,205,600 tons in 1923, 5,275,200 tons in 1922 and 7,003,850 tons in 1921.

The Mineral States Coal Co. and Richland Marshall Coal Co., of Marshall County, which had been served with notices by Sheriff Fred McNinch that their plants would be closed unless delinquent taxes aggregating $12,000 were paid, appeared in Circuit Court at Moundsville with their attorneys, July 6, and sought permission to continue operation upon the promise to make payment soon. The court granted the request.

C. P. Collins, consulting engineer, announces that he has purchased the interests of the Clarksburg Engineering Co., Inc., with offices at 801-2 Goff Bldg., Clarksburg.

The property of the Smith Pocahontas Coal Co., of Caloric, Wyoming County, for which stockholders refused an offer of $500,000 a few years ago, was sold in front of the court house at Princeton, Mercer County, on July 3, to satisfy a mortgage of $75,000 held by J. C. Pack, of Freeman. Mr. Pack was the only bidder. Stockholders will receive nothing for their stock nor will the holders of other claims. There were few outstanding claims against the company as a matter of fact. General depression in the coal industry and the inability of the company to produce coal at a price that would yield a profit are given as the reasons for the failure of the concern, which is equipped to mine and ship 10,000 tons of coal a month. The holdings of the company are on the main line of the Virginia Ry. and enjoy Eastern and Western railway connections.

Four mines of the Richland Coal Co. in the Panhandle District of West Virginia were ordered closed July 6 by Circuit Court Judge Brennan after the receivers of the company, John P. Arbenz and the Dollar Savings & Trust Co., had filed a petition declaring that the mines could not be operated at a profit at present. The mines, which normally employ about 2,000 men, have been operating with reduced forces since May 1.

In the first quarter of the current year the Island Creek Coal Co. produced about 1,245,000 tons of coal and earned, after reserves for depreciation and depletion and the period's dividend of $1.50 on the nearly 50,000 shares of preferred stock, a sum sufficient to cover the regular dividend of $2 on the 118,801 shares of common, as well as an extra dividend of $1. In the quarter just ended the Island Creek established a new high record for the three months output.

## CANADA

Quiet has latterly prevailed in the Cape Breton strike area. The inquiry into the death of William Davis, the miner who was shot by the police at New Waterford on June 11, was opened before Police Magistrate J. J. Smith on July 7. True bills have been found in the Supreme Court against 21 men concerned in the recent rioting for various offenses, and these cases have been set for trial at the October session of the court. All have been admitted to bail except Jean Jeanoff, of Glace Bay, charged with placing railway ties on the Sydney & Louisburg Ry. line. Operations at the Sydney steel plant of the British Empire Steel Corporation have been greatly curtailed.

E. N. Rhodes, who as the result of the recent provincial election, will soon become Premier of Nova Scotia, speaking at Halifax July 8, promised to take immediate steps to settle the coal strike. "Immediately after I am called upon," he said, "to assume the responsibilities of administering the affairs of this province and having full regard to government duties, I shall be the first to remove myself to Cape Breton and I shall remain there until this strike is settled."

There have been no disturbances at the six mines in Edmonton, Alta., where between 400 and 500 miners who are members of the Edmonton and District Miners Federation are affected by the strike which commenced on July 1. The Chinook mine offered to take back its employees at the old rate pending arrival at a satisfactory settlement, but the men at a meeting held July 2 rejected the proposal because the operators refused to recognize the union. The strikers decided to await the arrival of Fair Wage Officer Harrison, who it is expected will act as mediator between the parties to effect a settlement.

An official communication from C. P. Hotchkiss, executive-secretary of the Dominion Fuel Board, to Mayor Mitchell of Windsor, Ont., states that the federal government will establish large coke ovens in the Windsor district before winter. The coke, gas, benzol and other byproducts manufactured will be sold to consumers at cost, making a sharp reduction in fuel prices and relieving the coal situation, which has been acutely felt in past winters.

The Crow's Nest Pass Coal Co. has declared a dividend of 3 per cent covering operations for the first half of this year.

Charles McCrea, Minister of Mines for Ontario, states that the strikes of Alberta coal miners will have no effect on the shipment of the 25,000 tons of Alberta coal to Ontario as arranged for. The coal is ready for shipment and the Canadian National Rys. has given instructions for haulage so that no further delay is anticipated.

As the result of the examination held recently at Victoria, B. C., under the Coal Mines Regulation Act, two men qualified as mine managers, two as mine overmen, one as mine surveyor, and ten as firebosses. Twenty-six men were examined.

# Traffic

## Clinchfield Coal Corp. Seeks Cut In Rates to Tidewater

The Clinchfield Coal Corporation has filed a complaint with the Interstate Commerce Commission, Docket 17135, against the Carolina, Clinchfield & Ohio and Norfolk & Western railroads, attacking a rate of $2.77 on coal from mines on the Clinchfield to Lamberts Point, Va., via St. Paul and/or Carbo, Va., and the N. & W. Ry. The N. & W. publishes a rate of $2.52 per gross ton from mines in the Clinch Valley District No. 2 to tidewater at Lamberts Point for transshipment to vessels. Complainant asks that defendants be required to apply the $2.52 in lieu of the present $2.77 rate on shipments from Clinchfield and Dante, Va., via the N. & W. to tidewater at Lamberts Point, Va., for transshipment beyond the capes.

The Clinchfield Coal Corporation also has filed complaint in Docket 17136, versus the Clinchfield, Chesapeake & Ohio and Hocking Valley railroads attacking rates on coal from mines on the Clinchfield to Toledo and Toledo Dock, Ohio, for transshipment via lake. Present rates to these points via Elkhorn City, C. & O. Ry. and connections, are per net ton as follows: From Clinchco, Va., $2.39; from Clinchfield, Va., $2.64; from Dante, Va., $2.64. The complaint alleges that because the defendants apply the domestic rate on shipments from complainant's mines to Toledo and Toledo Dock, Ohio, for transshipment via lake, which is a differential of 48c. per net ton from Clinchco, Va., over the rates from Elkhorn City, and 58c. from Clinchfield and Dante, Va., over the New River district rates, they are giving undue preference to coal mines at points on C. & O. and Sandy Valley & Elkhorn. Complainant asks for a rate of $1.91 from Clinchco, Va., and $2.06 from Clinchfield and Dante, Va., in lieu of present domestic rates of $2.39 and $2.64, respectively.

## Committee Named to Study New Indiana Rate Schedule

Representatives of shippers and receivers of coal in Indiana, coal operators and traffic experts, held a conference recently at the State House in Indianapolis with representatives of the Indiana Public Service Commission to consider intrastate coal rates. The rates submitted by the carriers of the state were inspected by those who attended and a committee was named to meet with attorneys to determine whether the proposed coal rates will be satisfactory to all interests of the state.

A. B. Cronk, Indianapolis attorney, who acted as chairman of the conference, discussed briefly the proposed coal rates. Officials of the Indiana State Chamber of Commerce also spoke. Recommendations were made by the conference that a committee of ten traffic men be named to go over the rate schedules submitted by carriers for intrastate coal shipments and make recommendations. The committee is to make its findings within a short time. It may submit other recommendations which it feels will solve the present rate situation in Indiana.

One of the southern Indiana representatives attending the meeting was L. Lacroix, Evansville, traffic manager of the Evansville Chamber of Commerce, who also represented a number of coal operators in that section.

## Must Guarantee Freight Charge On Slack to Canada

A. M. Dudley, general coal freight agent of the Chesapeake & Ohio Ry., has advised shippers in that territory through the Northeast Kentucky Coal Association that it has been brought to his attention that delays have been experienced on slack coal intended for Canadian territory because of the fact that guarantee of payment of freight did not follow shipment and that investigation develops that the Canadian lines have legally published tariffs requiring a guarantee of freight charges on shipments of slack coal. He further states that in order to prevent any misunderstanding or delay it is suggested that such information be disseminated among the coal operators. The published tariff in no way affects the arrangement for forwarding Canadian traffic on a collect basis.

## Virginian Rate Order Held Up

The Interstate Commerce Commission has issued an order in the Wyoming Coal Co. vs. Virginian Ry. and others, case, postponing the effective date of its order entered May 19, 1925, to Aug. 25, 1925. This is a case in which the commission ordered the Virginian to publish through rates westbound.

Coal merchants and consumers of Fulton, Ky., have filed complaint with the Kentucky Railroad Commission, charging unfair rates from western Kentucky mines on the Illinois Central R.R. to Fulton, and asking for reduced rates and reparations for overcharges.

## Industrial Notes

**The Conveyors Corporation of America,** 326 West Madison St., Chicago, announces the appointment of the Chicago Electric Co., 740 West Van Buren Street, Chicago, as district representative for the sale of American mono-rail cable conveyors in northern Illinois and northern Indiana.

**The Trico Fuse Mfg. Co.,** of Milwaukee, Wis., has opened a new Chicago district sales office at 1742 Monadnock Block, 53 West Jackson Boulevard.

**The Fuller-Lehigh Co.,** Fullerton, Pa., has acquired the pulverized fuel interests of the Bonnot Co., of Canton, Ohio, including exclusive rights to the Blake water tube bottom (water screen), Blake vertical firing and Sherban and Pomeroy unit-air-ball mill, now known as the Fuller-Bonnot unit ball mill. Some of the engineering personnel of the Bonnot Co. has been retained.

**The Chicago Fuse Mfg. Co.,** of Chicago, manufacturer of Union and Gem fuses and Union outlet and Gem switch boxes, has moved its Philadelphia office from the Weightman Building to 517 Packard Building.

## Coming Meetings

**Rocky Mountain Coal Mining Institute.** Summer meeting, Aug. 26-29 at Price, Utah. Secretary, Benedict Shubart, Denver, Colo.

**American Institute of Mining and Metallurgical Engineers.** 132d meeting, at Salt Lake City, Utah, Aug. 31 to Sept. 3. Secretary, F. F. Sharpless, 29 West 39th St., New York City.

**Oklahoma Coal Operators' Association.** Annual meeting, Sept. 10 at McAlester, Okla. Secretary, A. C. Casey, McAlester, Okla.

**New York State Coal Merchants' Association.** Annual convention, Sept. 10-15, at Richfield Springs, N. Y. Executive Secretary, G. W. F. Woodside, Arkay Bldg., Albany, N. Y.

**National Safety Council.** Annual meeting Sept. 28 to Oct. 2, at Cleveland, Ohio. Managing Director, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

**Tenth Exposition of Chemical Industries,** Sept. 28 to Oct. 3, at Grand Central Palace, New York City.

**Canadian Institute of Mining and Metallurgy.** Annual western meeting Nov. 3-5, Winnipeg, Manitoba, Can. Secretary, George C. Mackenzie, Drummond Bldg., Montreal, Que., Can.

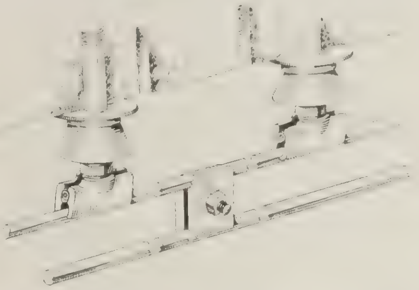
**Fourth National Exposition of Power and Mechanical Engineering,** Nov. 30 to Dec. 5, at Grand Central Palace, New York City.

**Coal Mining Institute of America.** Annual meeting, Dec. 9-11, Pittsburgh, Pa. Secretary, H. D. Mason, Jr., P. O. Box 604, Ebensburg, Pa.

# New Equipment

## Cushioned Trolley Increases Haulage Reliability

Heavier loads in mine haulage demand greater current-carrying capacity for the feeder lines and higher speeds make it necessary that the trolley be "cushioned," that is to possess a certain flexibility vertically. To obtain these results the General Electric Co., offers the type of trolley construction and fittings shown in the accompanying illustration.



**Details of Double Trolley Construction**

Not only is the current-carrying capacity of this trolley approximately twice that of the ordinary single-wire type, but the construction is such that the action of the trolley wheel is always cushioned and the wheel, therefore, seldom jumps.

The basic idea here embodied is the use of two wires, one supported from the other at approximately the midpoints of its span. By this means the trolley wheel never traverses any portion of the wire that is rigidly supported, and its upward thrust is always exerted against a wire that is free to give somewhat and no abrupt changes in trolley contour or grade are possible. As a result the wheel will follow the wire much more surely than it will follow a trolley mounted in the ordinary manner. It seldom jumps.

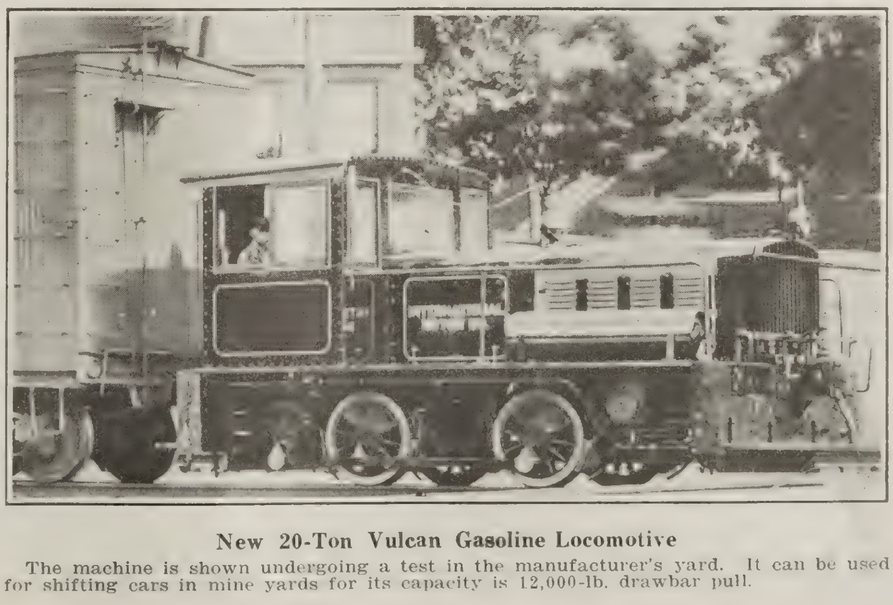
Little comment on the accompanying drawing is necessary as it is practically self-explanatory. The lower or contact wire although held rigidly in position horizontally, is free to move vertically. Naturally the current-carrying capacity of this arrangement is approximately double that of a single wire. Connections from a paralleling feeder cable may be made to the upper wire only. The construction is extremely simple throughout and where reliability and continuity of exacting operation are of prime importance the results obtained fully warrant the increased expense.

## Gasoline Locomotive Is Big Enough for Mine Yards

To meet the prevailing demand for heavier gasoline locomotives, the Vulcan Iron Works, Wilkes-Barre, Pa., has built a new 20-ton machine, to be known as Model HS-20. The manufacturing company has designed and constructed this locomotive along the same lines as its other heavy models. Steam locomotive practice is followed very closely in the chassis construction. Springs are of elliptic type with cross-equalizing arrangement giving three-point suspension. On standard gage track, in shifting railroad cars—for which work this machine is primarily adapted the locomotive is furnished with M.C.B. automatic couplers, with spring buffer and draft rigging arrangement in the bumpers. This device takes up the shocks encountered in coupling and relieves the strains in pulling and pushing the heavy railroad cars.

The locomotive is powered with a 6-cylinder, 125-hp. motor. The motor is a heavy duty industrial type with crank shafts accurately machined as well as counter balanced, thus permitting the engine to run at a moderately high speed without undue vibration.

It is designed for four speeds forward and four speeds reverse and is



**New 20-Ton Vulcan Gasoline Locomotive**

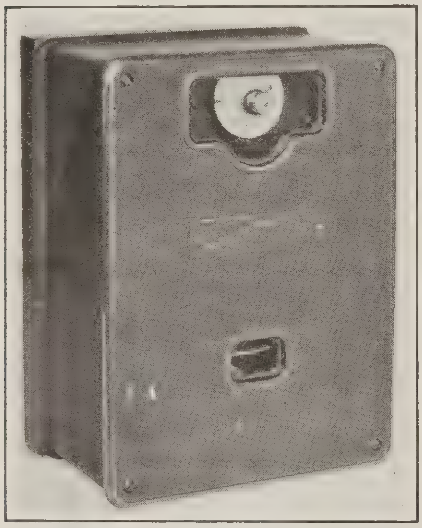
The machine is shown undergoing a test in the manufacturer's yard. It can be used for shifting cars in mine yards for its capacity is 12,000-lb. drawbar pull.

geared from 2 to 15 m.p.h., with a maximum drawbar pull of 12,000 lb. It has a comparatively short wheel base to negotiate reasonably sharp curves.

## New Power Relay Can Be Set Without Removing Cover

A new General Electric Co. power relay can be calibrated, without removing the cover, by means of a knob projecting through the glass window at the upper part of the case. This relay is for use in limiting the power on distribution lines to a predetermined quantity. It has a large range of calibration, running from zero to 1,000 watts, secondary, heavy contacts are used, and the internal mechanism is simple.

This relay is manufactured in three forms; the IG-102, an over-power and under-power device with contacts for controlling either alternating or direct current, and two over power devices, one for alternating current and the other for direct current known as the IG-103 and IG-104, respectively. By rotating the knob at the window, the relay may be adjusted for operation at any deviation from the desired load. A graduated dial, mounted beneath a fixed needle, rotates with the calibrating knob, giving visible indication of the load setting.



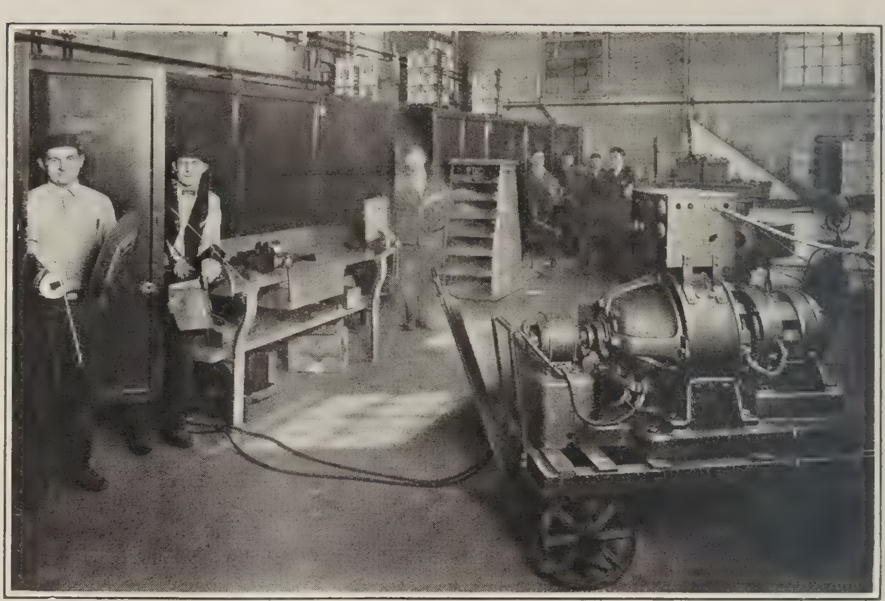
**No Need to Remove the Cover to Set This Relay**

The knob on the outside of the cover makes it easy to set the tripping loads of this new instrument. Dirt and dust are always excluded from the interior.

## New Companies

**The Cleveland Cash Coal Co.** has been chartered with an authorized capital of $5,000 to operate coal properties in Ohio and other states. Incorporators are E. R. Levin, J. A. Fatica, H. A. Harn, H. A. Peck and Nathan Herstram.

Articles of incorporation have been filed by the **Schrolucke Coal Co.,** of Indianapolis. William H. Howe, William Schrolucke, William K. Proule, William H. Abraham and George Hilgemeier were named as didectors. The company has a capital stock of $100,000. Each of the incorporators now is engaged in the coal business in Indianapolis. The object of the incorporation is to combine the resources of the individual companies and handle the output of several mines now being operated independently.



**Westinghouse Welding School Enlarges**

In order to keep abreast of advance in autogenous welding, particulary the progress made in arc welding, the Westinghouse Electric & Mfg. Co. recently has enlarged and centralized the school it has been conducting for some years in order to provide adequate and systematic training for its own employees as well as those of other companies utilizing this process. Here each student during his training performs a series of exercises arranged in progressive sequence. At first only simple problems are given him, but these become more and more intricate as skill is acquired. The school room itself is divided into booths so that each student may work undisturbed and unhampered.

New and up-to-date apparatus including a 1,000-amp. motor-generator set fitted with six outlet panels, arc-cutting apparatus varying from 400 to 600 amp., a portable 200-amp. arc-welding set and all other necessary equipment have been installed.

## Publications Received

**Twenty-Sixth Annual Report of the Mining Industry of Idaho for the year 1924,** by Stewart Campbell, Inspector of Mines. Pp. 249; 6 x 9 in.; illustrated.

**Coal Mine Fatalities in the United States,** 1924, by W. W. Adams, Bureau of Mines, Washington, D. C. Pp. 95; 6 x 9 in.; tables.

**Superheat Engineering Data.** The Superheater Co., New York City. Sixth edition; revised. Price, $1. Pp. 208; 4½ x 7 in.; illustrated. A handbook of the generation and use of superheated steam and related subjects.

**Production of Oil and Gas Field Equipment Against Corrosion,** by R. Van A. Mills, Bureau of Mines, Washington, D. C. Bulletin 233. Pp. 127; 6 x 9 in.; illustrated.

**What the Coal Commission Found,** by E. E. Hunt, formerly secretary of the Coal Commission. Williams & Wilkins, Baltimore, Md. Price, $5. This book is one of the "Human Relations Series." Most of the chapters were written by persons who were connected with the commission, and it has a foreword by John Hays Hammond.

**Twelfth Annual Report of the State Inspector of Coal Mines of Colorado,** 1924, by James Dalrymple. Pp. 61; 6 x 9 in.; tables.

**Standards of the Hydraulic Society.** Pp. 34; 6 x 9 in.; illustrated. Third edition. Contains, in addition to the information in the earlier editions, new and valuable data, such as a standard classification of pumps, standard nomenclature and definitions pertaining to the industry, etc. Copies of the book may be had on application to C. H. Rohrbach, 90 West St., New York City.

**Standard Specifications.** Carnegie Steel Co., Pittsburgh, Pa. Tenth edition. Pp. 140; 5 x 7½ in.; illustrated. Covers steel for bridges and buildings, locomotives and cars, boiler and boiler rivets, commercial and forging bars, reinforcement bars, forgings, railway and industrial wheels, axles and shafts.

**Fundamentals of Business Organization,** by Webster Robinson. McGraw-Hill Book Co., 370 Seventh Ave., New York City. Price, $2.50. Pp. 230; 5½ x 8 in. Presents an analysis and explanation of the character, value and application of those factors and relationships which are essential to an effective organization structure.

## Obituary

**J. Fred Morlock,** head of the Morlock Collieries Co. and certain auxiliary concerns, was found dead in his chair at his office in Ellicott Square, Buffalo, July 10, of apoplexy. He had been in the trade more than 30 years. His age was about 60 and he leaves a wife. He entered the business as an anthracite dealer, but later handled mostly bituminous.

## Trade Literature

**U. S. Auto-Start Motor.** U. S. Electrical Mfg. Co., Los Angeles, Calif. Four-page folder illustrating and describing the starting and running of this automatic self-starting squirrel-cage motor which accomplishes magnetically what has heretofore been done mechanically.

**The Organization and Functions of the Institute of Research of Lehigh University,** Bethlehem, Pa. Circular No. 1. Pp. 19; 6 x 9 in.

**Tests for Railway Material and Equipment,** by Henry Knauer. Simmons-Boardman Publishing Co., New York City. Pp. 257; 4½ x 7½ in.; illustrated. Price, $3. A book for railroad men who have to pass upon the merits of railway material and appliances.

**The Total and Partial Vapor Pressures of Aqueous Ammonia Solutions,** by Thomas A. Wilson. Engineering Experiment Station, University of Illinois, Urbana, Ill. Bulletin No. 146. Pp. 50; 6 x 9 in.; illustrated. The determination and calculation of the total and partial vapor pressures of aqueous ammonia solutions and their application to the absorption ammonia process, illustrated by a concrete example, are the subjects dealt with in this bulletin.

## Insist on Arbitration

IN THEIR PRELIMINARY offer the anthracite operators have volunteered to accept arbitration. They have also agreed to work while the arbitral tribunal makes its award. These righteous decisions should be accompanied by a declaration in severalty that the operators will sell their coal at the present price with, however, all discounts lifted on Sept. 1, as has been customary practice in former years. The old-line operators and some of the independents mean to do so. Why not make the declaration now?

But for the public good the Government should also take action. It should call for prompt submission of the differences to arbitration by a board that would meet not later than Aug. 31, if the two parties have not previously come to an agreement. It should call on the mine workers meantime not to suspend operation, and it should draw attention to the fact that the operators have from the first decided that in so far as they are able they will not permit a suspension that would shorten the supply to the public or cost the people a single penny.

The practice of lashing the recalcitrant miners with no greater fierceness than the public spirited operators is unfair and produces the wrong attitude among those who most need rebuking. A ready political device it is to put operators and miners together sometimes dubbing them "the coal industry" and then to scold both for not resolving their difficulties, but the necessity of the public brooks no politics. Rather it requires a clear vision of what is right and what is wrong and a disposition to express the truth, the whole truth and nothing but the truth, and do it with courage and exactitude.

Now is the time to arrange arbitration before the public is demanding an immediate settlement. The miners want a delay. Give them no opportunity to bring the pressure of suspension on the public or the case will be won not by justice but by panic.

The administration wants to know why there has been no success in preventing the miners from upsetting matters every two years. There is reason enough. It is the Government's poor selling policy. It has condemned the very persons whose claims it believed just.

If the administration is hopeful of getting a settlement, of keeping wages from undue levels, of getting more undercutting machinery and conveyors into anthracite mines, of weeding out men who work only half a day, of laying off men who, by threat of a strike, are enabled to cling to jobs that do not help production or that only take one-half or less of a man's energy, the administration weakens its own case when it abuses miners and operators alike.

The word of the administration is the word of power. It should not be used lightly in condemnation. It should not be critical of the operators when it is getting all it wants from them, or the public will support the mine workers and run counter to the administration. That is poor publicity, stupid diplomacy, and will get the Government nowhere.

In all the editorials and reports of administration utterances that we have seen, nothing has been said as to the offer of arbitration made by the operators. There is a conspiracy of silence and even worse—one of misrepresentation apparently. Carter Field interviews Secretary of Labor Davis on July 17 and reports him as saying: "We shall attempt to bring all the pressure possible to bear on both sides to force them to permit mediation by government-appointed referees."

Of course that distinguished individual may have been misquoted or he may have spoken unguardedly, but certain it is that he should have been careful to correct the error and say that "The government will certainly attempt to bring the mine workers to accept the operators' offer of arbitration." Does the duty of supporting labor that apparently rests heavily on Mr. Davis' Department require him to misrepresent the situation by such a statement as that he is alleged to have made at Swampscott? Last week we had to record a similar misrepresentation. Amid all the jangles of miners and operators, the nation looks to Washington as to Olympus. When it fails, what hope remains for public enlightenment?

## Keeping Cool with Coal

COAL MEN must not be content to wait for orders to come to them, nor spend all their time competing with one another. They must look to increasing the demand for coal and for the kinds of coal with which they find themselves glutted—namely the fine sizes. This research will bind coal men together and give them a common not a diverse aim. We believe there are opportunities to increase the tonnage marketed if coal men will back the development of indirect ways in which coal may be used. "Keeping cool with coal" is one of these. Does the public know to what extent the cooling art has progressed? Does it know how cooling may be effected?

A revelation of the advanced stage of this art would stimulate its growth. Investigation has shown that heating, ventilation and refrigeration engineers do not know themselves how rapidly the practice is growing. If they do not know it, the public doubtless is uninformed, and an opportunity is afforded for performing this publicity service. Everyone wants cooler conditions in summer. If the public learns how many have that advantage, and how they appreciate it, it will demand an extension of the practice. Here is a chance for constructive work.

The coal man will not get any orders for coal that are earmarked for refrigeration, but the larger orders of power companies consequent on the development will aid the industry nearly as greatly as if they came from the individuals who are seeking conditioned air. There is need, therefore, for a survey of air-conditioning activity and practice in all its phases—ventilation, air washing and refrigeration.

The bituminous coal industry waited too long for the automatic stoker. It did not do its part to promote the introduction, and really, when the change came, it saved so much fuel that it was not wholly a blessing to the industry. The cooling program is on the other hand a marvelous possibility. It will add to the consumption of coal; it will make its draft on the small sizes; it will come at the time of the summer slump, and it will speed up industry so that there will be less let up in the hot-weather activity. Let the slogan, therefore, be, "Keep Cool with Coal." In this propaganda we can look for co-operation from the ventilation and refrigeration engineer, the manufacturer of refrigeration equipment, the power station, the builder and architect as it will assist them all. They will joyfully add their endeavors to those of the coal industry.

## High Cost of Haggling

THE ONE-PRICE merchant has cut out haggling in the stores of America. The principle of "take it or leave it," which is delivered in a more diplomatic form as, "That is the marked price which no one has authority to change," has caused buyers to ask the marked price and buy almost without any further question. Unfortunately, it has become the practice to haggle about machinery and to have a varying rate for special designs not based directly on the additional service and the cost of the changes. So every man who has machinery to buy prepares to haggle like a slippered merchant in the alcoves of a Far Eastern market.

Manufacturers send representatives to camp sometimes for weeks on the trail of the man who has a large order. As the time consumed increases, the bidders still remain. They would not perhaps have tried to get the order if they had known it would cost them so dearly but to give up the quest is to lose what has been spent, so they stay on, still hoping, while the busy engineer, general manager or president is working and scheming in other directions with only casual interest in the salesmen who sit in a sad row behind the railing in the outer office.

The high cost of merchandising is due partly to the expense of haggling. The standards of the manufacturer have not been high enough. He has not been ready enough to tag his goods. There has too often been a lower price that adroit bargaining and the play of one manufacturer against another would disclose and attain. A fair, fixed price that would give the buyer confidence, by saving selling costs, would enable the manufacturer who established his prices inflexibly to underbid his competitor and make the closing of contracts easy where now it is difficult. A clear exposition of the costs of changes in construction would eliminate a desire to change specifications which engineers too often evince.

In one instance recently $15,000 was said to have been spent in saleswork and design for a piece of construction, the contract for which was ultimately placed for less than $70,000. The engineers asked bids from several manufacturers all of whom prepared special designs. If the contract had been given in the first instance to the manufacturer whose equipment was of the most desirable type, and then if changes had been suggested and the cost of change had been added to the price all this loss would have been saved.

To ask for designs from persons whose product is not really being considered is in a sense dishonest, but it is the natural outcome of the haggling principle. Where price is not set absolutely, every sale must be made by haggling. The manufacturers who consent to haggle, consent thereby to be haggled in turn. They can expect nothing else.

## Shop-Worn Merchandise

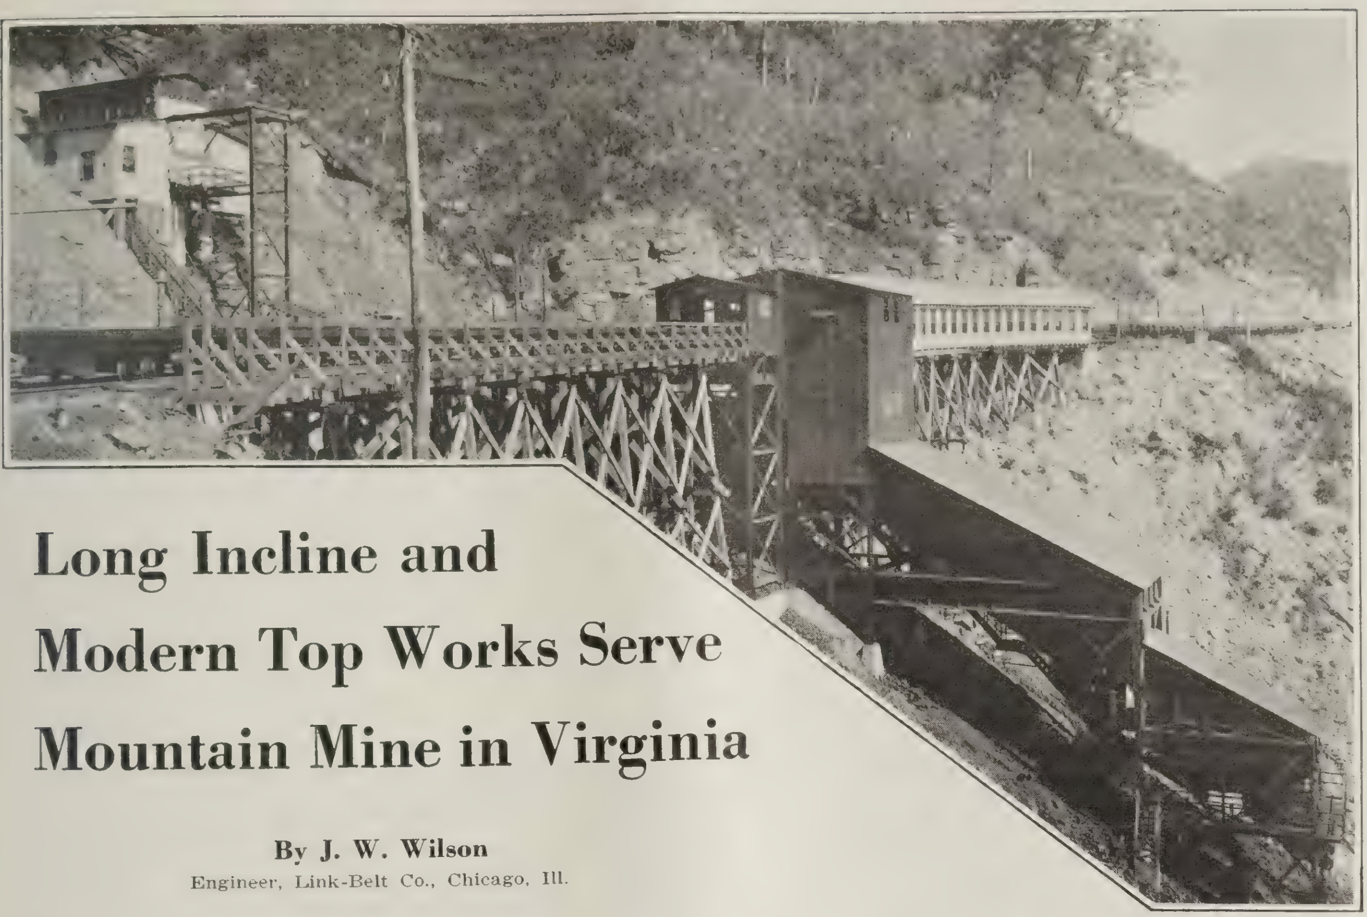
NOTHING SO DELIGHTS the average Thespian as good, old, moth-eaten, sure-fire "hokum." There is, as everyone who watches them in action will soon discover, considerable of the theatrical in the make-up of the common run of labor leaders. Economics and bloodless figures are not belittled in direct negotiations with the employers, but, when the labor leader is making a point for public consumption, popular appeal, rather than soundness, is the flavor he seeks to impart to his offering.

It is not surprising, therefore, that that sturdy veteran, "extortionate freight rates on anthracite," should have been trotted out by Vice-President Murray of the United Mine Workers at Atlantic City last week and paraded in all its ancient glory. The alleged unreasonableness of the transportation toll upon hard coal has been the favorite theme of individuals with special axes to grind for lo, these many years. Whether there is any basis in fact for this deep-seated belief—the fundamentalist creed of most critics of anthracite—we do not know.

What we do know is this: The Interstate Commerce Commission is the only body authorized by law to sit in judgment upon those rates. The miners, in their gesture for an appeal to Washington, concede the competency and thereby acknowledge, in public at least, a respect for the decisions of that federal tribunal. The Interstate Commerce Commission in 1915 passed upon the reasonableness of the base rates to tidewater after one of the most exhaustive investigations in its history. It examined the earnings and the operating costs of the anthracite carriers and pried into their then existing and past relations with the producing companies. Subsequently the Commission also passed upon rates to Middle Western key points such as Chicago and Detroit. Every change which has been made in the general rate structure since that time has been made in accordance with the orders of federal authority.

What, then, can the miners or the public hope from petitioning the Commission to institute another investigation? Mr. Murray says that his followers "have examined ultimate equities (whatever they may be!) and know that substantial cuts can be effected in freight rates of anthracite coal-carrying roads." If Mr. Murray and his associates "know" this, why was not the United Mine Workers represented at the hearings held under the 1923 investigation instituted by the Interstate Commerce Commission on recommendation of the United States Coal Commission? Why, when Governor Pinchot, likewise among the missing in those hearings, suggested that part of his gift to the miners could be assumed by the railroads, did not Mr. Murray and his associates rush before the Interstate Commerce Commission and demonstrate to that body that Gifford was a true prophet?

It is not surprising, we repeat, that the miners, who appear to have abandoned all pretense of justifying their demands for wage increases upon economic grounds, should resort to such "hokum." It is not surprising, but hardly flattering to the public. But, then, the union has never shown convincing evidence that it holds a high opinion either of the length of the public memory or of its intelligence.



The headpiece shows the incline headhouse. Here a 2-car rotary dump empties trips from the mine through the weigh house into a 125-ton bin. An undercut gate feeds from the bin into 20-ton monitors operating in balance on the incline. The second bin at the extreme lower end of the headhouse is for overflow. It also is equipped to discharge over the incline track so that eventually monitors can be operated and loaded in tandem.

# Long Incline and Modern Top Works Serve Mountain Mine in Virginia

By **J. W. Wilson**
Engineer, Link-Belt Co., Chicago, Ill.

MANY ENGINEERING and construction problems were involved in building the outdoor plant of the Blue Diamond Virginia Coal Co.'s new mine near St. Charles, Va. Coal is taken from four openings high on the side of Little Black Mountain in the Pocket district of Lee County and is hauled various distances ranging up to one mile to reach a headhouse on the shoulder of the mountain. There it is emptied by a revolving dump into bins feeding 20-ton balanced monitors operating on a 3,600-ft. slope whose maximum grade is 58.9 per cent down the mountain to a well-equipped tipple nearly 1,000 ft. nearer to sea level. There is also an incline nearby for men and material. The plant is built to handle at least 3,000 tons a day.

The new camp and location is known as Diamond, Va. It is served by the Southern Ry. and the Louisville & Nashville R.R., which has operating rights over the Southern's line. The lease of the coal company lies partly in the State of Kentucky. The No. 10 coal vein in Black Mountain will average about 66 in. thick with a parting near the center about ¼ in. thick. A 6-in. slate vein above this bottom bench of coal separates it from 12 to 20 in. of coal above it and on top of which is found a solid sandstone ledge that, in places, will average 30 ft. thick. Only the lower bench of coal is being mined except in main haulways.

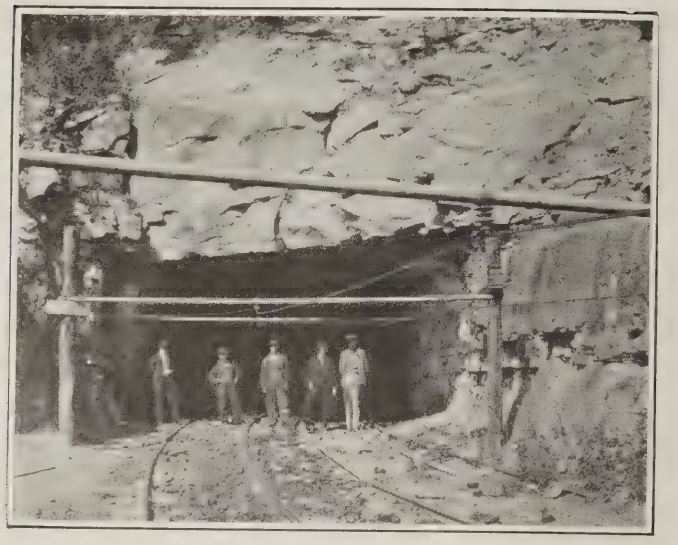
The preliminary development work has been laid out from the four openings on a room-and-pillar system of mining. The main haulage tracks are of 60-lb. steel, the gathering tracks 40 lb. and rooms 20 lb. on a 48-in. gage. Solid body mine cars of about 3-ton capacity, with 12-in. surcharge, are used and are equipped with hand brakes.

Electric power is purchased from a power company whose station is only three miles away and whose transmission lines to the Harlan coal field on the north side of Black Mountain cross over the mountain on the coal company's property. The high tension power is transformed to 440 volts for power service outside the mine and converted through two 200-kw., 275-volt rotary converters to direct current for mining machines and haulage motors. With full load on the converters and the hoist at a given time, the alternating current drop is less than 3 per cent and is seldom over 1½ per cent under normal conditions. Because of the close proximity of the substation to the machine shop, semiautomatic control was decided upon.

Quite a number of departures from past practices have been incorporated in the equipment for the handling and preparation of this coal, some because of the peculiar conditions of topography and others due to the characteristics of the coal.

In the construction of the grade for the haulageway from the mine openings, a steam shovel was started up from the hollow in which the railroad is located at about elevation 1,600. It built a road ahead of itself about 12 ft. wide. The contour of the surroundings were such that 2½ miles of this road had to be made to reach the headhouse location or elevation 2,594 at top of rail of the mine track at the rotary dump. Some of the grade on this roadway is as steep as 15 per cent. This steam shovel was then used to build the outside haulageway to the four openings, the longest of which was about a mile.

The first work was commenced on the material incline,



**One of Four Openings at Blue Diamond Mine**

At this point No. 1 butt main enters the coal. The strong roof that overlies the No. 10 seam in this part of the Black Mountain is to be seen over the portal. Coal is hauled down a 2½ per cent grade to a rotary dump in the headhouse. From there it descends the long incline in monitors to the tipple at the railroad.

which is about 300 ft. east of the dumphouse and coal incline. This material incline is about 4,000 ft. long, is built up the point of a ridge, and has seven humps in the track, which eliminated much blasting of rock and filling for the roadbed. Sixty-three pound rail on 48-in. gage was laid and a temporary wooden tipple was built at its lower end, where development coal was loaded into railroad cars with simple preparation over bar screens into two sizes, steam and block.

An ordinary steam hoist, using a $\frac{5}{8}$-in. wire rope, was used for material haulage during the construction of this incline. An electric hoist is now employed, driven by a 150-hp. motor, using a 1-in. wire rope. During the construction of the main coal haulageway, this incline handled an average of 300 tons per day, the hoist lowering four 3-ton cars per trip. This incline is also used to haul the men to the top. A special car was built to hold 44 men. Convenient loading stations and waiting houses are provided at the upper and lower ends. The hoist for this incline is set on solid rock at elevation 2,632.

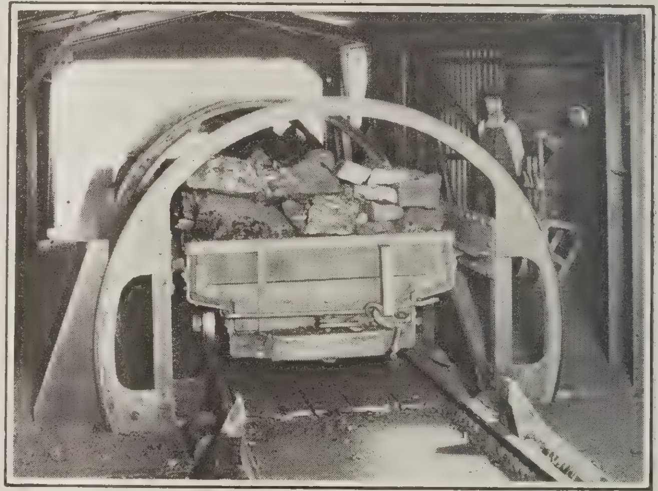
**In the Blue Diamond Tipple**

This view shows the interior of the preparation house looking from the egg-loading boom toward the control station. The shaker screens are in the right background.

Such good fortune did not occur in the hunt for a good foundation for the gravity incline machine on the main coal incline, which it was necessary to place in the hillside some distance above the headhouse.

The 150-hp. motor on this material hoist on the lowering part of the trip, pumps back considerable power into the alternating current line. During the construction period this reversal was so pronounced that the power company placed a ratchet on the meter to prevent it from registering a credit to the coal company. The 150-hp. motor is of the wound-rotor induction type, 440-volt and direct connected to the hoist drum by double reduction gears providing for two speeds. In low gear at 300 ft. per minute rope speed, it has a capacity of 12 tons, and at 600 ft. per minute in high speed, a capacity rating of 6 tons. The maximum grade on this man-and-material incline is 56 per cent, and the average grade approximately 40 per cent.

The control of this hoist motor consists of full automatic panels, seven contactors for the secondary, a forward and reverse switch in the primary, master controller, maximum torque switch, emergency switch and no-voltage and overload protection.

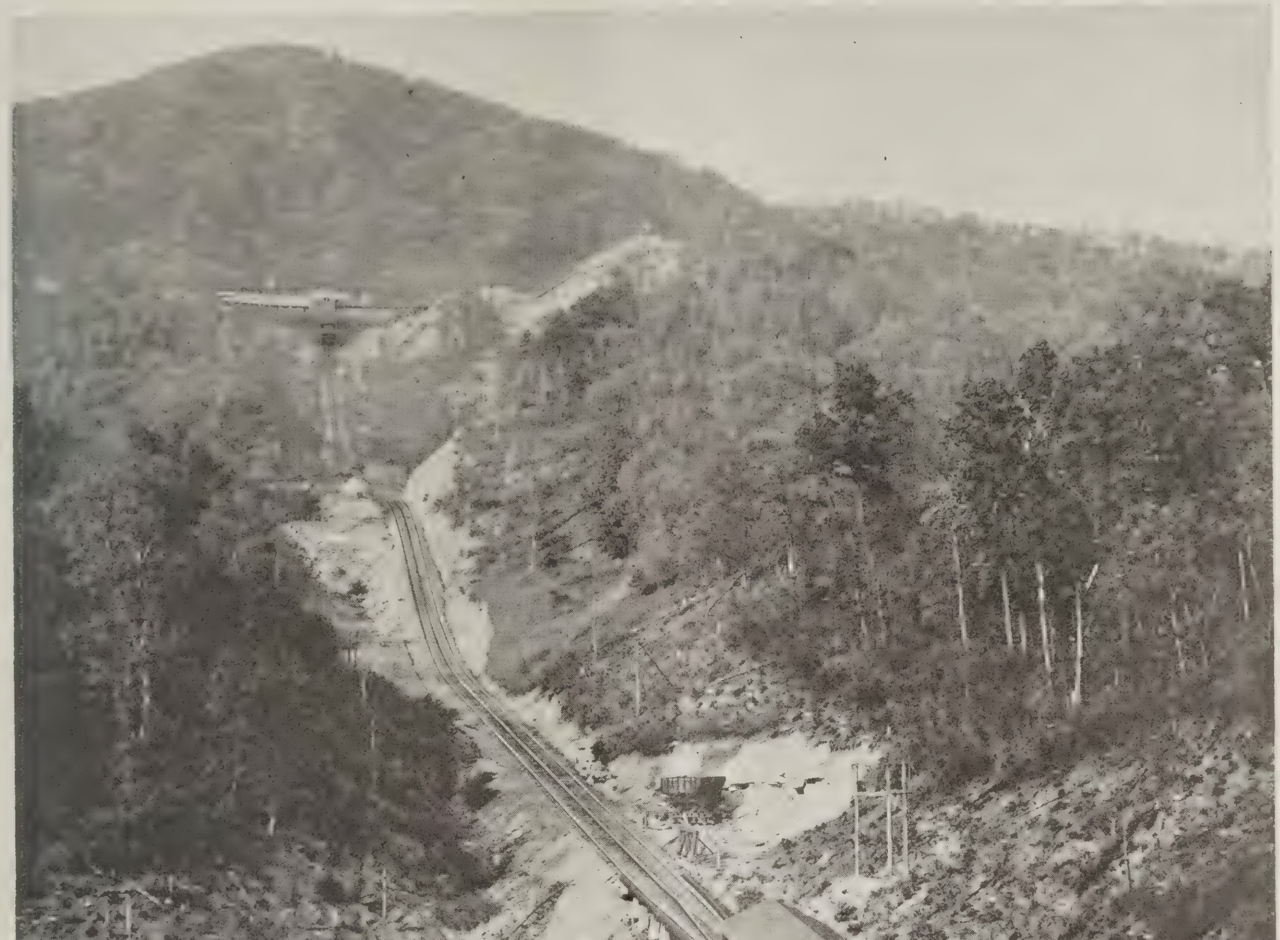


**Two-Car Rotary Dump**

This machine in the headhouse handles 400 tons an hour at the present maximum operating speed of the Blue Diamond mine. This capacity may be increased later.

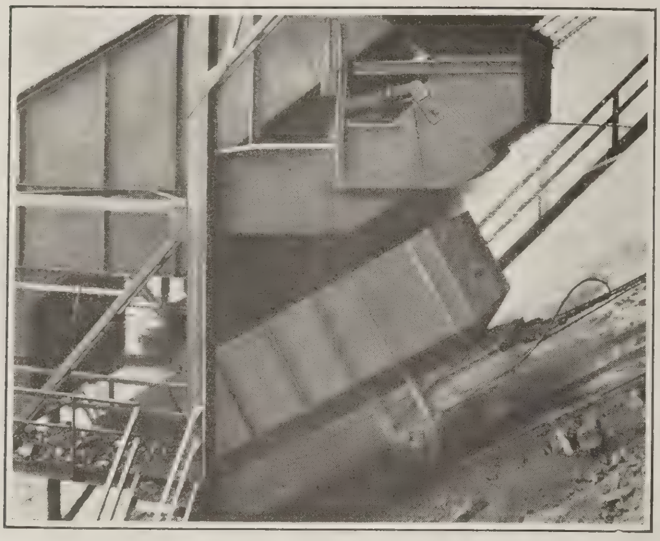
To serve the main coal incline the loaded and empty mine cars in trips of about 30 cars each, are brought to and taken from the headhouse over double track having 2½ per cent grade in favor of the loads from the openings. A 2-car rotary mine car dump, power driven, dumps the contents of each car into separate, suspended-type, weigh boxes equipped with machines automatically recording the weights. For about 100 ft. above and below the rotary dump, the mine car tracks are on 3 per cent grade. The track through the rotary dump itself is level, and the arrangement has proven satisfactory in operation. Swivel couplings are used on the mine cars, so they are dumped in train, the spaced horns ahead of the dump, in the dump and below the dump eliminating tension that the tram grades would otherwise give.

The two weigh boxes are equipped with gravity discharge gates closed with counterweights, and discharge directly into a 125-ton capacity bin above the monitor tracks. A secondary bin of 35-ton capacity, immediately beyond the large bin down the incline, is



The Blue Diamond Virginia Coal Co. Operates a Long Tramway at Its New Mine

Coal is hauled from four portals around the shoulder of Black Mountain to the headhouse seen near the top of the picture. There it is dumped into 20-ton monitors which lower it 994 ft. by the coal incline, the grades of which are as steep as 59 per cent in places. The 4-track tipple over the railroad is equipped with shaker screens, rescreening equipment and steel pan loading booms capable of handling at least 3,000 tons of coal a day.



**Monitor Loading on the Incline**

The air-operated undercut gate is open, feeding coal from the 125-ton bin into the 20-ton drop-bottom car. Each of the two balanced monitors makes a round trip in 6 min. on the 3,800-ft. incline, lowering coal from the headhouse to the tipple, a vertical distance of 994 ft.

automatically filled through overflow from the 125-ton bin. Both bins are provided with two large air-operated gates, of the undercut type, for loading the monitors. This arrangement makes possible the loading of two monitors in tandem, each monitor holding 20 tons.

The distance from the headhouse to the shaker screens of the preparation plant below, is approximately 3,600 ft., and an average operating cycle of 6 min. was estimated. This was to provide for 400 tons per hour of ultimate capacity with two monitors loaded simultaneously at the headhouse bins, and brought down in tandem, each trip, therefore, carrying 40 tons of coal. At present, one monitor on each end of rope is used, and the operating cycle averages less than four minutes, recently 24 trips having been made in 58 min., elapsed time. Therefore, it may be some time before it will be necessary to use monitors in tandem.

The maximum grade on this coal incline is 58.9 per cent immediately underneath the headhouse loading bins. One and one-quarter inch rope is used with the single monitors. The gravity machine drums are grooved for $1\frac{3}{4}$-in. rope, which will be used ultimately in connection with the two monitors in tandem.

The coal monitors of the 4-wheel, rigid type, are 18 ft. long, 9 ft. wide and 9 ft. 6 in. high above rails. Three rails are used on the gravity plane from the headhouse to the turnouts at the middle, and below the turnouts three rails to within 50 ft. of the lower dumphouse, where four rails are again used, spaced just rail clearances apart. Eighty-pound rail on 66-in. gage is used for this monitor runway with sawn wooden ties and track carefully stone-ballasted.

The gravity incline machine is of the 2-drum 4-brake type. Drums and brakes are 10 ft. in diameter, seven grooves in each drum, and brake bands 14 in. wide. Asbestos brake lining is used. The incline machine has a 150-hp. motor connected to drums through an expanding friction clutch to permit spotting of monitors if landing under loading bins is improperly made by operator, and also to permit rerailing of monitors in case of derailment on the incline. The motor haulage speed for this rerailing or spotting service, is 90 ft. per minute. The two brake bands on each drum are air-controlled, as well as the expanding clutch for motor connection. The valves for these controls, the motor controller and the valves for controlling the four undercut gates loading the monitors, are in the operator's station alongside the lower bin, where the operator can spot upcoming monitor and load it immediately after.

The rope from the monitor to the incline machine leads through a series of 96-in. diameter vertical and 48-in. diameter horizontal cast steel sheaves, and further protection is given the rope by installing flanged drums of 18-in. diameter and 24-in. face at the lower end of the bin structure.

The monitors discharge through drop-bottom doors into a 150-ton equalizing bin ahead of the shaker screens below. A steel pan conveyor automatically draws coal from this lower bin at the rate of 400 tons per hour, feeding the shaker screens, where sizing is made into 4-, 5- or 6x2-in. or $2\frac{1}{2}$-in. egg coal, and 2-in. or $2\frac{1}{2}$-in. screenings. The block and egg coal are rescreened

**Substantial Haulage**

On this main line from the workings, trips of 30 cars are hauled down a $2\frac{1}{2}$ per cent grade to the incline headhouse. Sixty-three-pound steel is laid on solid roadbed. Rails on curves are cross-tied with 1-in. rods as shown in the foreground to withstand heavy side thrust.

before being placed on the steel pan conveyor-type picking tables, where any impurities may be taken out before the coal is loaded into railroad cars below by adjustable, steel, boom sections of these pan conveyors, which are lowered by electric hoists, operated by push-button control from the trimmers' walks below the picking floor and alongside the cars.

### Refuse Easily Disposed

Any refuse found in the coal is thrown into a steel pan conveyor located underneath the picking tables and at right angles to them, providing the most convenient means for easy disposal of the refuse by the pickers. This conveyor discharges into a bin of about 1,400-cu.ft. capacity, which is emptied, as required, by wagon or truck.

At the end of the picking tables, another cross conveyor of the steel pan type, is used for taking either egg or lump coal from the raised-up ends of loading booms, and carrying it to a 100-ton capacity storage bin for house or town coal.

Four loading tracks are provided under the preparation structure, but only three are used at present. The fourth will be an additional lump track.

Each loading track is equipped with a car retarder. Tracks under the tipple are on 2½ per cent grade. The track scale and scale house are located immediately below the ladder of loading tracks.

**Rope-Centering Sheaves**

This 6-wheel arrangement at the top of the Blue Diamond incline is laid out between the hoist and the plane. In this photograph, taken under the headhouse, a monitor is shown at the loading position.

## Arrangement of Burners Raises Powdered Coal Efficiency

For some years it has been fairly well recognized that coal could be burned more efficiently in the powdered state than in any other. This is largely because when fired in this condition the draft control is more sensitive and accurate and, consequently, the admission of excess air can be reduced to a minimum. Efficiencies and boiler ratings unattainable, commercially, by other methods of firing are thus rendered possible.

Two chief problems were encountered in this method of coal firing. The first was that of obtaining quickly an intimate mixture of air and fuel so that combustion might proceed as rapidly as possible. The second was that of protecting the brickwork of the setting from rapid deterioration from the intense heat generated.

### Whirling Flame Used

Several years ago one of the engineers of the Fuller-Lehigh Co., conceived the idea that both of these objects could be gained by giving the flame a whirling motion similar to that of the cyclone. To get this revolving action of the flame, four jets were placed at right angles to each other within a well in the bottom of the furnace, the arrangement being such that each succeeding jet impinged upon and deflected the flame from the one preceding. By this means the furnace walls were protected from direct contact with the flame while simultaneously an extremely intimate mixture of the pulverized coal and air was obtained. The result was an intensely hot flame of short length.

Results of tests conducted on a commercial installation of this type in the Sherman Creek Station of the United Electric Light & Power Co., of New York City, show efficiencies from 3 to 5 per cent higher than those attained in other powdered-fuel installations in the same plant. Furthermore the curve of efficiencies obtained at various boiler ratings is much flatter than anything heretofore demonstrated.

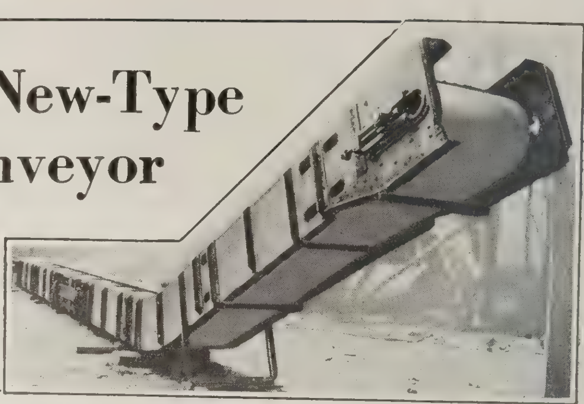
In two other details the well-type of burner seems to possess a substantial advantage over other varieties. First, the combined volume of well and combustion space need be no greater than the combustion space of the ordinary stoker-fired boiler. Second, the rapid whirling motion of the flame seems to sweep away the so-called "dead film" surrounding the tubes, permitting an extremely rapid heat absorption by the boiler heating surface. This permits driving the boiler at exceptionally high ratings.

While it is perhaps too early, as yet, to foretell the future application of this type of furnace, all experience thus far gained would indicate that it would be well adapted to installation under boilers where automatic stokers have been installed originally. The small combustion space necessary would render it especially applicable to this use. It would also appear to be well fitted for boilers installed in plants where economy of space is an important consideration. While no experiments on its use in the burning of refuse fuels, such as bone and rash at the mines, have been reported, this furnace would appear to be as well adapted to this purpose as any of the other and better known designs.

## Creosote Treatment for Dry-Rot in Wooden Mine Cars

The Hillman Coal & Coke Co., Pittsburgh, Pa., has experienced more or less trouble from dry-rotting of wooden mine cars which have been out of service for several months in idle mines. In an attempt to check this fungus growth within the wood of mine cars, this company is treating the latter with a creosote wood preservative. The effects of this treatment is being watched with interest.

# Belt Rides on Wheels in New-Type Sectional Coal Face Conveyor



## Drive Section May Be Inserted in Line at Any Point—Only Two Men Needed to Operate Machine at Face

By **Alphonse F. Brosky**
Assistant Editor, *Coal Age*,
Pittsburgh, Pa.

ANOTHER APPLICATION of rubber-fabric belting to coal-mine machinery has been made. This takes the form of a continuous, sectional belt conveyor intended for transporting coal from the working face to an entry where the cars of a trip may be loaded one after another without appreciable delay. The belt rides on wheels. This conveyor is said to be the first of its kind to be offered for use at the face in coal mines.

Like several all-metal conveyors of the same general type devised for underground use, the belt conveyor, as illustrated in Fig. 1, combines two end sections, a vertically-curved section, a drive section and a number of interchangeable straight sections. One or more of the latter can be added or removed, as required, to lengthen or shorten the unit. All sections are compact and comparatively light in weight affording ready portability.

In Fig. 2 are shown two sections of belt and a straight segment of the conveyor frame. Instead of moving over idlers like the ordinary conveyor belt, this one is carried by wheels turning on axles bolted at intervals to the belt sections. These wheels traverse rails that form a part of the conveyor frame. Each section of belt is 6 ft. long. The supporting axles are fastened to it on 3-ft. centers, so that only two sets of wheels are attached to any one section, one located in the middle and the other at one end. In joining, of course, the sections are so mated as to maintain uniformity in the pitch of wheel centers.

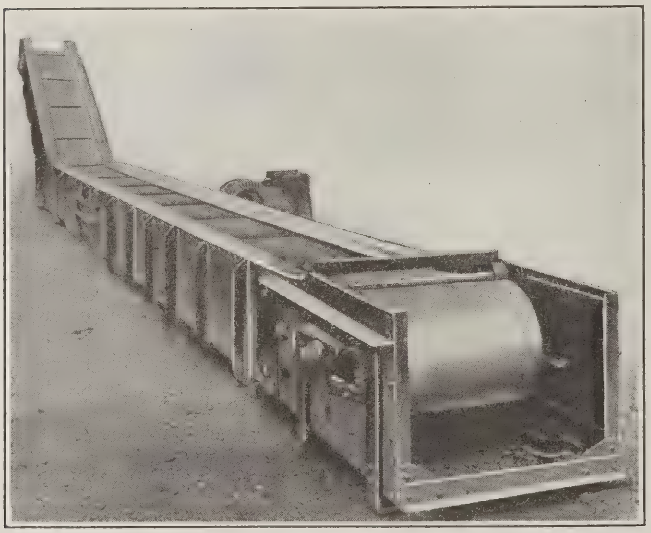


**Fig. 1—General View of the Conveyor**

A pair of the wheels that support the belt has just rounded the head pulley and is about to enter the guides between which movement to the discharge end is confined. The drive section may be seen near the middle of the conveyor.

The wheel axles are attached to the upper surface of the belt and thus serve as low flights, checking any backward movement of coal in slope positions such as the belt assumes while going over the discharge end of the conveyor. The wheel treads are slightly convex. Flanges on these wheels are unnecessary inasmuch as they are kept on the track by the guiding effect of the conveyor-frame sides.

Belt sections are joined together by an interlapping hinge arrangement. The hinge offsets contain $\frac{3}{8}$-in. steel tubes which receive the hinge rod when this is put in place. The belt, which is 4-ply and reinforced on its carrying side, is wrapped around these hinge tubes and the overlaps vulcanized. The tubes are thus reinforced with rubber.

The conveyor frame is fabricated of 14-gage steel plate stiffened with angles and held together by means of cross braces and tie rods. Within and upon either side of the frame are an upper and a lower rail on which the belt wheels run. This is of standard 8-lb. section. The upper edges of the side plates are bent inward and downward forming skirt boards which cover the wheels and track and keep coal from dropping from the upper conveyor run to the lower. Although the belt is actually 20 in. wide, its effective width is cut down by the overhang of the skirt boards to $14\frac{3}{4}$ in.

Frame sections are 6 ft. long. They are joined together by bolts and nuts or by a wedge key arrangement. The overall height and width are $20\frac{3}{4}$ in. and $29\frac{3}{4}$ in. respectively. With the exception of the drive section which, of necessity, must be somewhat heavier, each frame section weighs about 250 lb. Two men should have no difficulty in lifting one frame section and one man can easily handle two belt sections at one time.

The drive section, which also is 6 ft. long, can be inserted in the conveyor line at any point. For a 250- to 300-ft. conveyor with a capacity of 50 tons per hour at a belt speed of 100 ft. per minute, a 5-hp. motor drive will suffice. Power is transmitted from the motor through an angle-type of speed reducer to a driven shaft on which are mounted two sprockets, which in turn, actuate two conveyor haul chains. These are of steel roller, automotive-truck type and at intervals carry dogs which engage the conveyor wheels transmitting motion to the belt. The motor and speed reducer are mounted on a separate base which can be detached from the drive section proper while the conveyor is being moved to a new location.

Both head and tail sections are provided with a pulley

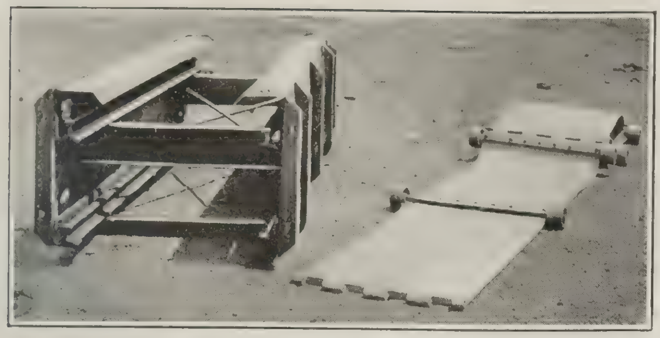

**Fig. 2—Belt and Straight Frame Sections**

Section after section of the belt may be joined together by merely passing rods through the holes in the interlapping hinge lugs. The wheels on the belt axles traverse the rails attached to the conveyor frame.

or drum which the belt rounds in passing from one run of its endless path to the other. Inasmuch as the conveyor is driven from the center, the head and tail pulleys are each provided with a screw take-up to insure uniform tension on each end of the drive. The discharge end can be elevated to a considerable height, being supported, as shown in the headpiece, from a single bent which it overhangs as a cantilever.

The design of this conveyor, known as the Thorsten, is such as to retain the major advantages of belt conveyors more permanently installed. Simultaneously it provides flexibility of the carrying agent—the belt—and simplicity of the other moving parts. It possesses other advantages, however, in addition to those of the ordinary belt. These accrue by reason of the fact that the sections of belt are linked together as one piece and supported by wheels which move with them. At only two points does the belt itself make contact with any part of the conveyor—at the head and tail pulleys. Elsewhere the wheels which support it receive the friction wear. They can be replaced quickly. Friction between the end pulleys and the belt is not relied upon to impart motion to the latter. Driving both the upper and lower runs of the conveyor simultaneously equalizes the pulling forces.

Because of these features of the design, the belt keeps in alignment with respect to the various sections of the conveyor frame even though these sections themselves may not be exactly level or in line. It is this characteristic that makes practicable this semi-rigid belt conveyor of the sectional and portable type for use in mines, where the floor is always more or less uneven.

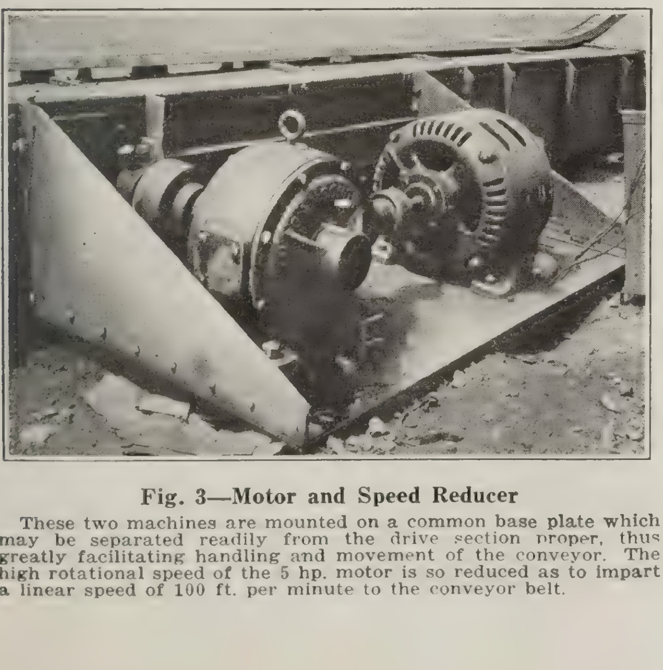

**Fig. 3—Motor and Speed Reducer**

These two machines are mounted on a common base plate which may be separated readily from the drive section proper, thus greatly facilitating handling and movement of the conveyor. The high rotational speed of the 5 hp. motor is so reduced as to impart a linear speed of 100 ft. per minute to the conveyor belt.

When the drive section is located at the middle of the conveyor, the tension of the belt at any point is one-half that at the corresponding point on a friction pulley-driven conveyor of the same size, because of the double drive provided. Slippage and consequent wear on the belt are eliminated by the positive drive.

The simplicity of this conveyor is further demonstrated by the few bearings required. Only two wheel-bearings for every 3 ft. of belt length are needed, whereas a conveyor of the ordinary type requires two idler-pulley bearings for every foot of belt length on the carrying side of the conveyor.

The principles of this conveyor are covered by patents taken out under the name of T. Thorsten, mechanical engineer of the West Penn Power Co. and its subsidiaries, the Allegheny-Pittsburgh Coal Co. and the Windsor Power House Coal Co., all with offices in Pittsburgh, Pa. The conveyor itself will be manufactured by the Charleroi Iron Works, Charleroi, Pa.

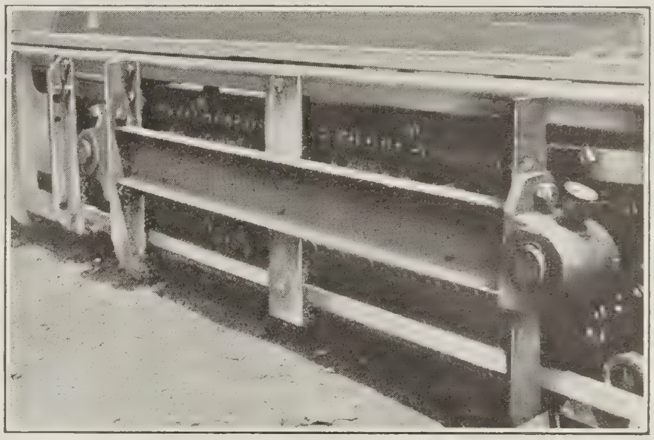

**Fig. 4—Conveyor Drive Section**

Dogs attached to the roller sprocket chain engage the wheels carrying the belt, thus driving the entire device. Inasmuch as both loaded and return strands are engaged and driven simultaneously, tension at any given point is at a minimum.

---

## Tests Mine Fire Hose and Water Pressure

A series of tests designed to ascertain the most suitable hydrant pressures and sizes of hose and nozzles for use in fighting mine fires has been completed by the U. S. Bureau of Mines, with the co-operation of the Illinois Geological Survey and the University of Illinois. The investigators found that the most effective combination of fire hose and water pressure for use by one man fighting a mine fire is that which gives a steam with maximum trajectory in a limited headroom and delivers the greatest volume of water.

The tests comprised stretching a line of 50 ft. of $1\frac{1}{2}$-in. hose with different warps and bends and using hydrant pressures ranging from 30 lb. to 150 lb. per square inch. The nozzles were all cone-shaped and ranged from $\frac{7}{16}$ to $\frac{7}{8}$ in. in diameter. A few similar tests were made with $2\frac{1}{2}$-in. hose.

The data obtained show that the $\frac{3}{4}$-in. nozzle apparently gives the most effective stream with 50 ft. of $1\frac{1}{2}$-in. cotton rubber-lined hose.

The results of these tests are given in Technical Paper 330, by L. D. Tracy and R. W. Hendricks, copies of which may be obtained from the Bureau of Mines, Department of Commerce, Washington, D. C.

# Eavenson Praises South for Advances in Mining

## Tells Pittsburgh Coal Mining Institute West Virginia and Kentucky Surpass Pennsylvania—Talks of Financing Mines—Affelder "Lays Down the Law" in Safety Speech

**By a Staff Correspondent**

SOUTHERN coal producing companies generally, and those of West Virginia and Kentucky in particular, are leading Pennsylvania in adopting advanced ideas in the construction of mine plants and towns, and in the selection of equipment. The Southern operator is making a more earnest effort to inspire contentment among his workers by better living conditions and among his customers by better prepared coals, according to Howard N. Eavenson, consulting engineer of Pittsburgh, Pa. He talked on "Financing and Constructing a New Mine" at the third quarterly meeting of the Pittsburgh Coal Mining Institute, July 10. In the second address W. L. Affelder, assistant to the president of the Hillman Coal & Coke Co., declared stoutly that operators ought to be more active in the mine safety movement.

The Institute is advancing the educational work by which it intends covering all phases of coal mining in a series of talks by capable engineering and operating men. This was demonstrated by the July 10 meeting, which was held in the Chamber of Commerce auditorium, Pittsburgh, Pa., and was presided over by W. D. Parker, U. S. Bureau of Mines. Optimism rules the organization by reason of the fact that its membership has passed the thousand mark, a remarkable growth in nine months from its beginning. Unfortunately, this meeting was poorly attended—by about 50 men—because of the 90-deg. temperature and Pittsburgh's customary depressing humidity experienced at this time of the year.

The most important factor making for the success of a coal operation is its labor, Mr. Eavenson said in his talk. A contented miner is a safe and efficient worker. In out-of-the-way localities the investment for the conveniences and comforts of life of the employee must be materially greater than that in more populous districts. It is not uncommon of owners in Southern fields to have invested in their towns the money equivalent of 60 to 100 per cent of the cost of the remainder of the property, making the housing investment 35 to 50 per cent of the total. Of course the towns do not pay for themselves directly. The owner is lucky to break even, while losing the interest on this investment; but the outlay is justified by the benefits.

Miners' houses must be built at least as good as those which the tenants would build for themselves, Mr. Eavenson believes. Some companies south of Mason and Dixon's line build even better than that. The need for substantial houses, large lots, fences, a good water supply, sewerage systems, good roads, bath houses and adequate community buildings is growing. In the future the mine owner will be compelled to go the limit in this respect as a result of the scarcity of good labor occasioned by the emigration laws now in force. American labor will not permit its standard of living to lower, he thinks.

Before seeking financial aid for the opening up of a new property it is now necessary to have all preliminary studies and calculations made. Layout plans, capacity, market possibilities and the estimated cost must be presented in the proposal for financial assistance. An allowance must always be made for working capital. If a mine intends only to produce and not to operate a sales office, it must have on hand sufficient working capital to cover at least two months' operation. On the other hand, if it decides to sell directly the coal

**The South Is Improving**

Good steel tipples like this one which the Blue Diamond Virginia Coal Co. has just finished give the South the reputation of surpassing Pennsylvania in mining advances. Monitors on an incline dump into a big bin. A steel pan conveyor feeds the shaker screens which can make six sizes of coal plus several combinations. Block and egg coal can be rescreened. Steel pan conveyor booms can load 3,000 tons into railroad cars in eight hours here.

which it produces the working capital must cover no less than six months of operation.

The most satisfactory method of financing a new mine is by the sale of common stock, but nowadays the stock purchaser is wary of speculation and wants a more assured income as from preferred stocks. Especially is this true in the financing of large companies. Bond issues in large amounts are dangerous in that they expose a company to loss of control. In this case the bond money is intended only for working capital and clearing standing debts. It is usual to issue bonds to the extent of one-third to one-half of the property value.

**Modern Mining Town in Big Sandy Field in Eastern Kentucky**

Efforts like this on the part of the mine operators do not return them any direct earnings on the investment in houses, Mr. Eavenson told the Pittsburgh Coal Mining Institute, but the indirect benefits in satisfied labor are worth having. Kentucky and West Virginia have many such towns, most of them recently built.

In a consolidation now pending involving $40,000,000 it is proposed to issue instruments in the proportion of 25 per cent of bonds, 20 per cent of preferred stock and 55 per cent of common stock. A four-month coverage of working capital is intended in this deal.

The first steps toward actual design of a new mine are the choice of track gage and type of mine car. Though in American practice the track gage ranges from 32 to $56\frac{1}{2}$ in., efforts toward standardization have established a preference for the 42-in. track gage, particularly by manufacturers, with second and third choices of 36 and 48 in. respectively.

Good properties are sometimes spoiled by poorly chosen types of mine cars. The car should be made as large and low as possible, Mr. Eavenson thinks. He has designed a steel car of the underslung type which, although it holds 3 net tons, is only 23 in. high. Southern plants take to cars of steel, a practice which has not met with much favor in the Pittsburgh district. He cannot understand why this district is backward in this particular. Acidity of mine water ought not to be an absolute deterrent. He mentioned one company mining the Pittsburgh seam that got fifteen years of service from steel in a mine whose water is $1\frac{1}{2}$ per cent sulphur. It has been his experience that the cost per year of maintaining mine cars of steel is one-third of wooden cars and that the latter are out of service 5 to 20 per cent of the time.

The solid type car is being more generally used, but drop-bottom cars are coming in. The type of mine car regulates the character of the dump as does also the output desired. For outputs near 3,000 tons from shaft mines, self-dumping cages are absolutely necessary; over this tonnage it is wise to consider skip hoisting.

Present-day requirements of the domestic market have driven the producer to the more general use of modern tipple equipment—of moving screens, picking tables and loading booms. The movement is less noticeable in the Pittsburgh field than in some non-union regions where it is not unusual to see five sizes being prepared over picking tables and lowered to railroad cars by loading booms. The extreme care with which coal is being prepared by mines in West Virginia and Kentucky may make it doubly difficult for the Pittsburgh district mines to win back their old markets.

A limiting factor for large output may be ventilation. This problem should receive careful study before the capacity of a mine is determined. Mr. Eavenson knows of one mine which may never reach its capacity of 4,000 tons a day because it gives off 2,500,000 cu.ft. of gas every 24 hr. under limiting conditions. This mine is opened up by groups of six to eight headings on the mains and is equipped with a fan which is capable of developing 400,000 cu.ft. of air per minute. However, at capacity this fan under existing conditions may work against a water gage in excess of 4 in.

In answer to a question by Francis Feehan, of the U. S. Bureau of Mines, Mr. Eavenson advised as a good investment at all mines the erection of a bath house.

To W. D. Parker, of the U. S. Bureau of Mines, he remarked that roller bearings on mine cars are economical, more so in big mines or where the haulage roads are not level. Mr. Maize asked about the place of rope, electric and conveyor transportation of coal along a 5 to 6 mile haul. He was told that electric haulage is far superior to that by rope. Where the tonnage is great enough, 4,000 tons or better, conveyor haulage bids fair to outdo even electric haulage in many cases.

State Inspector John I. Pratt, president of the Institute, sought an expression from Mr. Eavenson as to whether more extended use of machinery such as loaders and conveyors will require much greater investments for a given output than has been required in the past.

### Sees Elimination of Small Producer

It is the opinion of Mr. Eavenson that the investment will be bigger. Mechanical mining has not yet reached the stage where it might be considered absolutely successful. At least four or five mines equipped with loading machines or conveyors are doing well. The change to such devices must come and is coming. With the acceptance of complete mechanization mines may work two shifts a day and will be made bigger producers. The large investments which will be required to derive the economies of that day will be out of reach of many men who are now in the coal business. The small producer will go.

W. L. Affelder, talking on issues involving safety, frankly "laid down the law," declaring that, in great measure, mine officials and executives are responsible for the slow movement toward greater mine safety. He believes old-timers are hardened as the result of frequent accidents in the past, which they are disposed to regard as inevitable in mining. He would like to see the younger generation of officials weaned away from that idea. The tendency "to pass the buck" is too prevalent when accidents occur. There is too much disposition to look for an alibi and to put the responsibility on the shoulders of the unfortunate victim. Before workman's compensation was put into effect more zeal was exercised in looking for contributory neglect than in seeing to the victim's welfare. He is afraid this attitude is still too much in vogue.

Prior to his attendance at an executive meeting of the Western Pennsylvania chapter of the National Safety Council recently, he himself held the view that accident is the necessary toll of the industry. But he had that notion knocked out of his head during an exchange of experiences by members at this gathering. He retold the experiences of the Carnegie Steel Co. at its Duquesne plant.

By an intensive safety campaign the Carnegie company has succeeded in bringing down gradually what had been held as a normal accident rate in the steel industry to the point where the company is justly proud of its achievement. The plant employs 6,700 men; during the first 27 days in May the plant operated not only without a fatal accident; but it succeeded in avoiding even a single lost-day accident.

In 1924 the bituminous mines of Pennsylvania suffered 10.83 fatal accidents in each million man-days. His company last year had five fatal accidents for each million man-days. At the former rate based on the loss in bituminous mines of Pennsylvania the Carnegie Steel Co. could not have been criticized by the coal industry had it had two fatal accidents in its Duquesne plant during the time it maintained a clean slate. Mr. Affelder, in sulphurous language demanded to know why the coal industry can't do regularly as well as the Carnegie Steel Co. did in May.

"It can be done, I don't know how," he said, "but I'm going to find out." Accident prevention requires a different angle of approach. He is afraid too many attempts have been made to hammer safety home whereas, logically, it is better to use a milder and more personal approach. It is necessary to throw the burden on the individual by creating in him a *desire* to be safe rather than to *force* him to it.

Officials always ought to be on the alert for opportunities in which men might get hurt. Avoidable means of accident should be removed at any cost, inasmuch as the danger is great enough from unavoidable accidents. Many officials pat themselves on the back because they have records of non-fatalities over long periods. This is wrong because the line of demarcation between the occurrence of non-fatal accidents on the one hand and of fatal accidents on the other may be slight indeed. Exactly the same conditions and agents may be present in both.

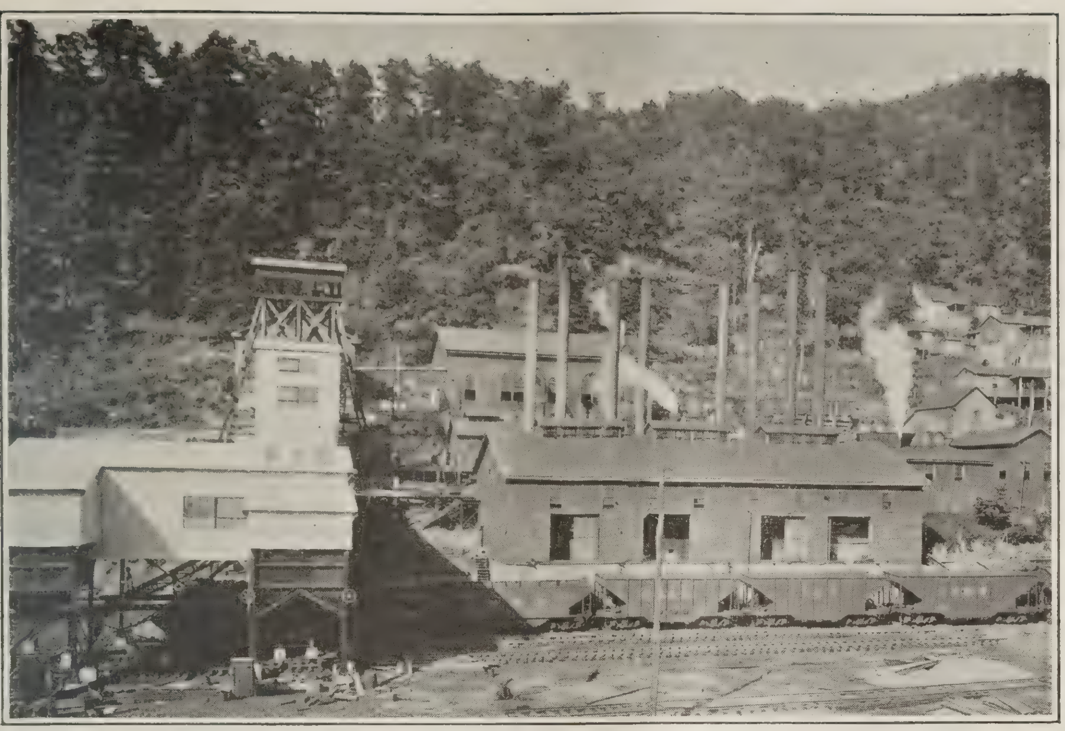
For instance, one of Mr. Affelder's miners was squeezed about the hips between a rib and a mine car. The injury was minor but it would have been fatal had the man been squeezed farther up on his body. Another of his miners was borne down to a crouching position by the fall of a 3-ton rock. The man escaped injury, but by all laws of chance he should have been killed outright. It is equally necessary to guard against conditions which might cause trivial accidents.

He does not believe in disciplining. A man resents it and is liable foolishly to satisfy himself by getting back at the boss. For instance, if a man is disciplined for not setting a post in his working place, the next time and during the interval between two visits of the boss he might deliberately work under an unsupported roof which ought to be propped by two posts. How much better it is to appeal to the negligent miner's love of family to induce him to practice safety.

### Feehan Presents Accident Costs

Mr. Feehan gave some figures on the cost of accidents in the anthracite field during the first four months of 1925. During that period, the Department of Labor and Industry of Pennsylvania reports, there occurred the loss of 1,300,000 man-days. This, of course, included many trivial cases of injury. At this rate for the entire year and at $5 a day the loss to the mine workers in round numbers would be $20,000,000. The loss to the anthracite mine owners would be equally as great.

Speaking for the U. S. Bureau of Mines on the work of the Joseph A. Holmes Association, J. J. Forbes, of the safety extension service division, said the real solution lies in systematic organization and co-operation, which can be secured through chapters of this association. The association reaches the men, women and children with its story by mixing safety talks with entertainment and refreshment in community gatherings. Of the 136 chapters organized by the Bureau there are 25 in Alabama. In that state the movement has been entirely successful. The Standard Oil Co. reports that at its Baton Rouge (La.) plant where the Joseph A. Holmes plan is in operation, after eighteen months of education 5,000 men worked forty-seven days without a lost-day accident. The general



**No. 1 Mine, Superior, W. Va.**

This mine is owned by the Lake Superior Coal Co., of Cannelton, W. Va., and located about three miles from Welch. It operates the Pocahontas No. 3 which, as will be noted, is reached through a shaft. The coal is from 42 to 72 in. thick. At Welch the beds are well below water level. It was for this reason that development around the capital city of McDowell County was slow. Of recent years the growth in this part of the smokeless field has been rapid.

manager of a coal company in Alabama, who at first was reluctant to give the plan a trial, admits that the chapter which he finally did establish did more in five months than all other efforts combined had done in five years.

In accordance with the plan of the Institute to present to the members all phases of mining, S. A. Taylor, consulting mining engineer, of Pittsburgh, Pa., was put on the program to talk on "Drilling for the Proving of a Coal Property and Other Allied Purposes." He outlined the three methods of drilling followed—core drilling, spudding and hand drilling.

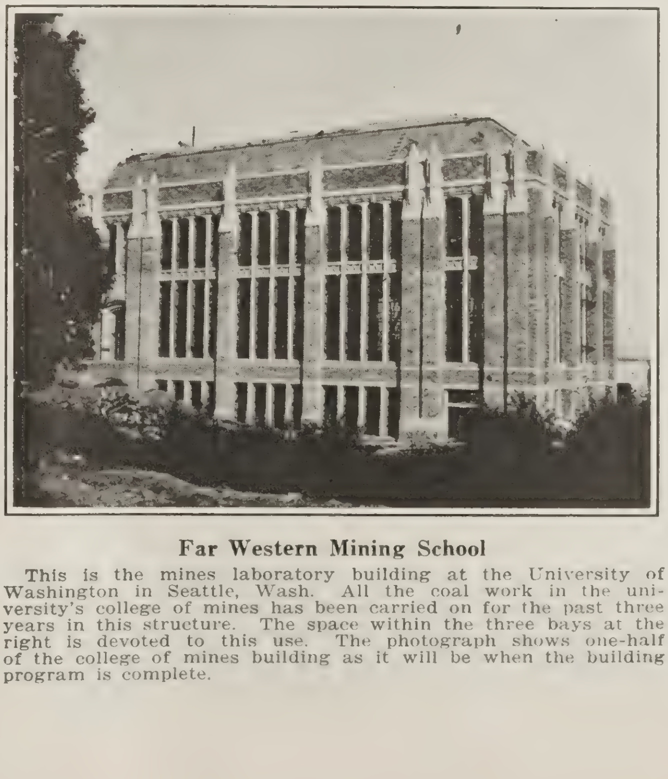
In core drilling he said it is better to use the diamond drill than the cold-shot drill because the latter is apt to break up friable coal whereas the former will give a true core sample. Spud drilling has its use in sinking holes for pump lines and power cables and for determining the elevation of coal. He believes the maximum diameter of a hole that can be made by a spud drill is 24 in. This diameter will afford a large area for wires, pipes and even for ventilation. He believes this method of drilling will be perfected and will aid in the ventilation of gassy mines as, for instance, in Greene County, Pa., where much gas is encountered. The greatest difficulty thus far experienced in spud drilling is in keeping the hole straight.

Hand-drilling, of course, is confined to light cover where it is particularly useful in proving stripping properties. He gave this tip: If the strata above a stripping property is too hard for hand drilling, it is likely to be too hard for steam shovel operation without the use of excessive quantities of explosive.

A diamond drill hole which strikes a fault or want is not wasted. A study of its core will reveal useful information and the hole itself will serve as a gage for the putting down of other holes around it in determining the extent of the wanted area.

Where any doubt exists as to the persistence of the a seam, as in the Freeport measure, it is well to drill ahead of advancing main entries so that if a wanted area is discovered the mine layout may be altered to avoid unnecessary expense.

With $300 of the dues collected from its 1,000 members the Institute is having prepared three engraved parchment trophies for the best low accident records of companies in the area the organization covers. One trophy will go to the record company mining the Pittsburgh seam in Allegheny and Washington counties, and that part of Westmoreland County on or west of the Youghiogheny River to the Fayette County line. The second will go to the winner in the thick Freeport seam. The third will be given to the company having the best record in the two districts. The winners will keep these trophies and new ones will be presented each year. The records will be determined on the basis of the ratio of tonnage to lost-time accidents, the latter to be weighted in accordance with the International Industrial Accident Committee standard.



**Far Western Mining School**

This is the mines laboratory building at the University of Washington in Seattle, Wash. All the coal work in the university's college of mines has been carried on for the past three years in this structure. The space within the three bays at the right is devoted to this use. The photograph shows one-half of the college of mines building as it will be when the building program is complete.

# Anthracite Operators and Miners Still Far Apart On Leading Issues in Wage Controversy

**By Sydney A. Hale**
Special Contributor, *Coal Age*
New York City

LITTLE PROGRESS and no agreement upon any of the controverted points marked the first week's negotiations of the subcommittee of the anthracite operators' and miners' meeting at the Hotel Traymore, Atlantic City, N. J., July 14-17, to consider the demands framed at the tri-district convention of the hard-coal workers at Scranton, Pa., earlier in the month. The question of the wages to be written into the contract to succeed the present one expiring on Aug. 31 was discussed in only the most general terms. The issue of the check-off, about which the battle raged in 1922, was mutually avoided.

Spokesmen for the producers, however, made it clear that they were in deadly earnest with respect to the two cardinal points in the address made by S. D. Warriner, chairman of the Anthracite Operators' Conference, at the first general session of the full joint committee—appended to this report. These points were the desire of the producers to make an agreement with the miners which would eliminate any possibility of a suspension on Sept. 1 and that it would be suicidal for the industry to attempt to increase the price of its product in the face of existing, vigorous competition with other fuels. Every strike in the anthracite region, it was pointed out, had resulted in the permanent loss of business in some sections of the country and the operators want to encourage no further curtailment of their potential and actual markets.

Although no official statement was made by the representatives of the mine workers, unofficially they indicated that they still stood with President Lewis in his rejection of the proposal to continue work after Aug. 31 if no agreement had been reached by that date, and to submit disputed points to arbitration. This, they said, would only prolong negotiations indefinitely.

### Miners Want Railroads to Foot Bill

On behalf of the miners the theory that an increase in wages could be met by a reduction in freight rates which would permit an increase in mine prices to cover a boost in pay and still leave something to the consumer was again advanced. The refusal of the operators to join with them in a petition to the Interstate Commerce Commission to take such action was stressed heavily. It was pointed out that these rates are now before the Commission in the general investigation instituted by that body two years ago on the recommendation of the United States Coal Commission and that the United Mine Workers have taken no active part in those hearings. When the question was asked how any investigation into rates started now could possibly be concluded before the expiration of the present wage agreement, the miners had no answer.

There were evidences of irritation upon both sides when the subcommittee began its labors. The fact that Mr. Warriner and W. J. Richards, president of the Philadelphia & Reading Coal & Iron Corporation, felt that their long service justified their retirement from subcommittee membership led to charges from the miners' camp that the operators were purposely prolonging the negotiations by asking the union representatives to deal with "second string" men. The fact that Mr. Lewis had quit the conference to repair his fences in the bituminous regions and that International Vice-President Philip Murray, his substitute, did not put in an appearance the first day the subcommittee met last week did not put the producers in a more friendly frame of mind. Considerable quiet resentment was expressed over the attack upon the operators' membership on the subcommittee, including as it does the head of one of the largest companies and executives of others whose positions put them in close touch with the labor situation. It was further emphasized in defense of these representatives that they had full power to act. The union representatives, on the other hand, are bound by the demands of the tri-district convention and any modification of those demands which they might agree to are not binding upon the workers unless ratified by that convention.

### Sensitive to Public Criticism

The sensitiveness of both sides to public criticism was again emphasized when plans to adjourn over the present week were abandoned. It had been tentatively announced that the subcommittee would recess on July 17 to July 28. This was for the purpose of giving Rinaldo Cappelini, president of District No. 1 and a member of the subcommittee, an opportunity to preside over the district convention at Wilkes-Barre, Pa., which opened July 20, without absenting himself from the subcommittee sessions. Editorial comment on the "leisurely" fashion in which the negotiations were proceeding brought about a quick change in program. Two sessions, instead of one, were held on Thursday and when the meeting adjourned early Friday afternoon the next session was set for July 21. Both sides were prompt to deny responsibility for delaying the proceedings.

Discussion of the last two clauses of demand No. 2 of the miners was as far as the subcommittee got at the first day's session (July 14) last week. These clauses read as follows:

> " . . . that the contract laborers' increase now being paid by the operators shall be added to the contract rates; that the differential in cents per day between classifications of labor previous to the award of the United States Anthracite Coal Commission shall be restored."

Prior to the supplemental agreement of Nov. 1, 1918, signed during the regime of the United States Fuel Administration, payment of contract laborers had always been taken care of by the contract miner. That agreement, however, in making an advance in laborers' rates, split the payment between the operator and the contract miner. This system was continued by the award of the United States Coal Commission in 1920. That award carried a 17 per cent increase to the laborers, but also provided that the contract miner was to assume and pay "so much of said increase as shall be represented by the application of 65 per cent to the rate per basic shift, as established under the agreement of May 5, 1916, and the difference between said amount and the total increase to the contract miners' laborer shall be assumed and paid by the operator." The basis of the percentage division was the fact that the same award increased contract rates 65 per cent over the 1916 figures.

On behalf of the miners it is contended that this system leads to confusion and dispute and that a return to the method in vogue prior to 1918 is in order. In the subcommittee meeting they claimed that the demand could be worked out on a percentage basis. The question raised was whether a return to the old system would not be as provocative of disputes as the present method. Consideration of the demand was continued in order to give the miners a chance to submit concrete examples of how their proposed percentage plan would work out.

**W. W. Inglis**
Chairman of the Operators' Subcommittee in wage negotiations with Union Representatives

The supplemental increases in wages allowed during the war were based upon the rates fixed by the 1916 agreement. Barring certain specified classes of labor on the day basis, increases to company men fell into two groups—increases to company men receiving less than $1.54 per day under the 1916 contract and increases to men receiving more. The final wartime agreement (November, 1918) gave the higher paid men increases of $1.80 and $2 per day over the 1916 bases; to the lower paid groups, an advance of $1.20. The 1920 award also recognized the same two major divisions and gave the higher rated group an increase of 17 per cent over 1918 rates, subject to a minimum rate of 52½c. per hour or $4.20 per shift. These rates were increased 10 per cent in 1923 by the Pinchot settlement.

The minimum rate proviso of the 1920 award had the effect of narrowing some of the differentials that had previously existed. For example, an outside company man receiving $1.55 per day under the 1916 rates by the application of the minimum provision was advanced to $4.20 in 1920; another outside employee receiving $1.60 per day under the 1916 rates came under the percentage increase and was advanced to $4.21, narrowing the differential from five cents to one cent. If the comparison is made between outside and inside company men, the fact that the 1918 agreement gave the latter a $2 advance, as compared with $1.80 to outside men, makes the changes in certain differentials still more marked.

The miners, of course, desire to retain the $4.20 ($4.62 under the Pinchot award) minimum, but argue that the old differentials should be restored as a proper recognition to the more skilled classes of labor. At the most, they say, the restoration will mean increases of only a few cents per day and will apply to only a small percentage of the workers. Beyond a general discussion of uniformity in rates, however, the subcommittee made no progress in the consideration of this clause in the miners' demands.

The sessions on Wednesday and Thursday broadened into a general discussion of the cost of production and distribution in its bearing upon wages. The miners suggested that a spread of $7 per ton between the f.o.b. mine price and the retail price at Philadelphia opened an avenue to profitable exploration in ways to advance wages without advancing the cost of coal to the ultimate consumer. From the contention that a wage advance could be met easily out of the profits of the wholesale distributors and the retailers, the line of attack was extended to include freight rates and royalties. Refusing the request to join with the miners in a petition to the Interstate Commerce Commission, the operators, as before stated, pointed out the fact that rates were now being investigated by the Commission and that that body had no jurisdiction over the question of royalties or over distribution costs other than transportation charges.

### DISCUSS QUESTION OF HAZARDS

Mr. Lewis' "blood money" argument for higher pay also claimed some attention. The operators frankly admitted that no widow or children could ever be adequately compensated in cash for the loss of a devoted husband and father. In so far, however, as it is possible to give weight to the hazards of employment in pay schedules, the producers insisted that this had already been done. Moreover, a study of accident statistics compiled by the Bureau of Mines and the Department of Labor shows a steady reduction. From 1914 to 1924 there was a 16 per cent reduction in total fatalities, the total falling from 595 to 496. Underground fatalities decreased over 17 per cent in the same decade.

Figures on a tonnage or an employee basis are still more favorable. In 1914 there was one fatality for every 152,000 tons produced; in 1923, one fatality for every 183,000 tons, an increase of 21 per cent in tonnage per fatality. For underground workers the tonnage per fatality rose from 170,000 to 208,000 tons. Fatal accidents per thousand workers declined from 3.31 in 1917 to 3.01 in 1923.

Fatal accidents per thousand employees on the railroads, it was pointed out, are 11 per cent greater. Commenting on these figures, the Department of Labor says:

"Coal mining presents less hazard than does train operation. The common opinion to the contrary is the natural outcome of the fact that mining casualties come from time to time in sudden catastrophies which excite prolonged interest on account of rescue effort, while the total railway accidents are the accumulated result of many single accidents. Coal mining is being conducted in a manner which is less dangerous to the miners than has been the case in the past."

Limitation of output was another subject touched upon in the subcommittee meetings. The miners argued that there were no restrictions encouraged by them and that to try to keep down tonnage would decrease the earnings of their own men. This argument was sharply challenged by the operators, who offered to cite actual cases.

One of the many instances of restriction in production is furnished by a strike at the Coal Brook colliery, where the men walked out because some miners had loaded more than five cars a day. The "guilty" workers were fined $10 each and, refusing to pay the fines, the local union countenanced a suspension of 11 days. In another case, the chief clerk at one of the collieries was informed that the local union had passed a resolution to discipline miners who loaded more than a certain number of cars daily. For the first offense a fine of $5 was levied; for the second, $10 and for the third, "a man would have to take his tools from the property."

In passing upon a case taken before the Conciliation Board and appealed, the umpire said that "the record stands that the weight of evidence supports the contention that the cause of the earnings of the complainants being what they are is the action of the local in endeavoring to put into effect, in violation of the agreement, a restriction of output, and the action of the complainants in limiting their output per day to the four car limit that has been set."

In another case, where a mine foreman asked two men who had finished loading their sixth car at 10:40 a.m. to load at least another car before quitting work for the day, the miner and his laborer informed the foreman that such action on their part would result in a $50 fine by the local. In still another case, the chairman of the grievance committee informed the general manager that the local union had passed a resolution forbidding any man to load more than two cars and any two men to load more than four cars. The president of one local even admitted the existence of such a rule and said it had been passed because the union did not want the operators to be able to show a large wage earned by individual miners. These cases are only a few of the many that the operators are ready to offer to uphold their contention that there is a deliberate attempt upon the part of the union to restrict the output, and, as a result, the earnings, of its members.

The final session of the week was devoted to further consideration of the split payment to contract miners' laborers and to another general discussion of wages. The latter was featured by a demand that the operators furnish the union with exhibits showing the salaries of the executive officers of the producing companies and the sums paid out in legal expenses. The operators reported that these figures were not germane to the present negotiations.

After the meeting had adjourned on Friday, Vice-President Murray of the United Mine Workers issued a statement attacking "propaganda" from the operators criticizing the failure of President Lewis to attend the week's conferences. The statement also disclaimed responsibility for any lack of progress made in the negotiations. Quoting accident statistics derived, he said, from Pennsylvania state reports and purporting to prove that three anthracite miners were killed and a like number permanently incapacitated for manual labor every day the mines worked, Mr. Murray reiterated that the present demand for increased wages was based upon the hazards of the industry.

---

# Anthracite Operators Demand Either Wage Cut Or Higher Productivity

THE ANTHRACITE operators, in the first statement of their position to the miners at the joint conference in Atlantic City, July 9, declared for either a substantial decrease in wages or a substantial increase in workers' productivity if the present high scale is to be maintained. They said wages cannot be increased without raising the price of anthracite to the already harassed consumer and competitive conditions make any upward trend of prices suicidal. The operators held strongly against granting the check-off and pointed out that they already recognize the union by meeting with its representatives.

They urged the miners not to precipitate a strike Sept. 1 by quitting work in case an agreement has not been reached by that date. Instead, production should continue while the possible disagreement is dissolved by arbitration. Future suspensions ought to be avoided, the statement said, through negotiation of a long-term contract with provision for the adjustment of wages to meet changed economic conditions during the term. The statement, which was read to the conference by S. D. Warriner, chairman of the anthracite operators conference, in part, said:

"We have read your demands with something approaching amazement, because as a whole they show such utter failure to consider the realities of the anthracite situation. You seem to think that anthracite is a necessity, for which the consumer will pay any price, however high. This is not the fact. Anthracite is not a necessity. Its use is subject to the same competitive laws that govern other commodities. If we do not give good service and maintain reasonable prices, the consumer will turn to other readily obtainable fuels.

"Where is the money to come from to pay present wages, to say nothing of meeting new demands? Not from the coal consumer, because he has already indicated in no uncertain terms that he believes the price of anthracite is already too high. To attempt to increase it would be suicidal. The real issue is the extent to which labor rates and costs can be reduced.

"Mr. Lewis is authority for the statement that the only way in which fair wages can be paid is by continued increased productivity on the part of the worker, and it therefore becomes necessary for us to consider in what way this result can be achieved.

"We must have a substantial reduction in labor costs. If this can only be obtained by a reduction in existing wage scales, then we believe that we should have such a reduction. If, on the other hand, through our joint constructive efforts some plan can be devised by which the productivity of the worker can be so increased that even with the retention of approximately the same wage scales a material or substantial reduction in labor costs can be secured, then our joint efforts should be directed to that result.

"Anthracite miners at the present time are enjoying higher annual earnings than any other workers of whom we have found a record. Your annual earnings, as shown by official reports, are higher than those of such highly paid employees as railroad workers, machine shop employees, electrical workers, printers, soft-coal miners and metal miners. The average annual earnings of all anthracite employees, which includes a large proportion of unskilled labor, is upward of $2,000. The contract miners average over $2,500, or $1,200 more than the average for all industries. The average annual earnings of all anthracite employees is more than $700 above the average for all industries. Your rate of increase in wages since 1914 is 192 per cent, while in railroading the increase has been only 141 per cent; in manufacturing 129 per cent, and in building 111 per cent.

"Three years ago and again in 1923, we prophesied that the increasing cost and price of anthracite would restrict its market and result in loss and unemployment in the industry. What was then a prophecy is now about to become a reality and one from which you, the miners, no more than we, can escape.

"We are faced by increasing competition from oil, and the figures reporting the number of installations of oil-burning apparatus are startling in their proportions. An authoritative estimate is that 5,000,000 tons of anthracite in domestic consumption has been replaced by oil. Other competition comes in the form of gas for heating purposes. One of the largest gas companies in the country has just announced that it has perfected still more economic apparatus for heating. The result of this is that the use of anthracite as a summer fuel has practically ceased.

"The extension of the use of electricity is another menace. Perhaps more important than any of these is the encroachment of coke upon our market, and the number of coke producing plants is steadily increasing.

"Most of the companies are realizing less upon their production today than they did in 1923. They have absorbed a large part of the ten per cent wage increase then granted to you. They cannot continue on such a basis. A large part of the production in the past year has been marketed at a loss; another large section of the industry has seen its profits approach the vanishing point. You cannot fix wages and cost of production at a point that can be borne only by a few companies exceptionally situated.

"You will simply delude yourselves if you accept the mistaken idea that the labor cost of producing anthracite is not by far the main factor in the total cost. Seventy-five cents out of every dollar received by us is paid to you for labor. The balance of 25c. is a very narrow margin out of which to met charges for material, machinery, taxes, insurance and return on investment.

"Do not fool yourselves by looking at retail prices. By reason of transportation and distribution charges, the retail price is necessarily greatly in excess of the mine price.

"Do not fool yourselves by looking solely at the prices for the domestic sizes. Domestic sizes are no more than two-thirds of the total product; the other third is sold at a great loss, although the labor cost and all other costs in producing it are the same.

"With increasing competition and diminishing sales; confronted by the self-evident proposition, if our markets are to be retained, that the prices for our product must be made more attractive to the consumer; with a narrow margin of profit on the average, and an absolute loss on a large part of the production, are we not faced with the necessity of lowering our cost of production if we are to continue to afford the opportunity of full-time employment?

"We agree to the proposition that anthracite workers should be well paid, and in asking for wage reductions we are not departing from that proposition. Just what the amount of such reductions should be we leave for discussion by the negotiating committees.

"As to the demand for full recognition of the union, you already have full recognition in the sense in which recognition is generally defined throughout the trade union world. We negotiate with your union and contract with your union. By meeting with you here we recognize your union. On the other hand, if this demand means the check-off, it seeks something not generally demanded or practiced by other unions. You are too familiar with what the operators and the American public think of the check-off to call for further discussion of the subject by us. Our opposition to the check-off is unabated.

### LABOR PRODUCTIVENESS LOWER

"It is a fact much to be regretted that in spite of constantly increasing wages and the employment of labor-saving devices of all kinds, the productiveness of labor in our industry has diminished rather than increased; it is no better than it was when you were receiving half as much in wages and were unaided by many of the improvements that have since been introduced.

"If restrictive rules, outlaw strikes, and other uneconomic conditions are eliminated and our employees will work a full eight hours, which is the length of day agreed upon, it would be possible to increase productivity and decrease labor costs without a corresponding decrease in earnings.

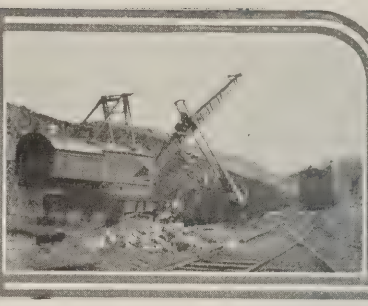
"One of the most important things for which we should jointly strive is industrial peace and uninterrupted production. The public is disturbed over periodic stoppages or threats of stoppage in the industry. In competition with other fuels, we often meet the argument that the supply of anthracite is not dependable, owing to interruptions of production through strikes. Many large sales are lost for this reason. To allay this fear and secure the confidence of the consumer we should do away with a militant attitude and settle our differences without resort to suspensions.

"Because of the differences which now arise between us, you asking for an increase in wages and we asking for a reduction, we wish to urge that provision be made at the outset against the possibility of a suspension on Sept. 1.

"Such joint action on our part would deserve public confidence. It can be accomplished by an agreement to the effect that if our respective committees are unable to agree upon any issues, such issues shall be referred to arbitration, upon the understanding that production shall be continued at the present wage scale until the arbitrators render an award.

"Let me say to you here and now that the operators are prepared to co-operate in any fair and practicable plan, not only to prevent a suspension next September, but to provide means to prevent suspensions in the future in order that public anxiety in this respect may be put at rest. This can be accomplished by a long term agreement with provision for the adjustment of wage rates during that term so that wages may be conformed to changing economic conditions."

# News Of the Industry



## Cause of Barrackville Blast Unknown; Company Is Exonerated of Negligence; May Have Been Thirty-fourth Victim

That the cause of the explosion and its source are unknown was the verdict returned by a coroner's jury at midnight, July 16, after a thorough investigation of the Barrackville (W. Va.) mine disaster in which 33 lives were snuffed out March 17, last. Throughout the day of July 16 many witnesses were called at the inquest, which was presided over by County Coroner Lloyd E. Fitzhugh in the Marion County Circuit Court room, in Fairmont. Robert M. Lambie, of Charleston, chief of the West Virginia Department of Mines, was the chief witness.

Mr. Lambie, while on the stand, testified that there was nothing shown to prove negligence on the part of the Bethlehem Mines Corporation or any of its employees. He was not convinced that a thirty-fourth body was found in the mine. The chief was of the opinion that it may have been a portion of one of the 33 bodies.

Thomas Jarrett, of Weston, a state mining inspector, testified that while on duty at the mine after the explosion, and when the cleaning-up process was under way, a company inspector had called his attention to a piece of paper that was used to enclose Monabel, a permissible. He directed that the paper be turned over to the superintendent for examination. Judging from its appearance, the paper probably had been in the mine for a long time and was trampled upon. It developed that the permissible without a cap was harmless. When the paper was exhibited in the court room Jarrett said that if it was the same paper shown to him in the mine it must have changed its color. The quantity of powder in the paper probably was equal to three sticks that had been crushed. It was found about 100 ft. away from where the torso of one of the victims was found. In the opinion of Jarrett a short-circuit from a feed cable caused the explosion. A portion that was cut off showed that it was burned in two, he added.

V. E. Sullivan, of Charleston, a state mining inspector, thought that it was a dust explosion that started near the bottom of the shaft.

In the opinion of Robert Lilly, of Mount Hope, a state mining inspector, a general coal-dust explosion resulted from an arc of a cable, which had the appearance of being roasted and blistered. In his opinion all of the force traveled from that point of the mine (2½ N. W. main butt entry).

C. W. Stuart, of Thomas, a state mine inspector, said he was of the opinion that the explosion resulted from an arc formed on a feed wire at 2½ N. W. main butt entry.

Attorneys representing the United Mine Workers attended the inquest and asked a number of questions. Although no direct charges were made, a number of press accounts intimated that the mine was dynamited.

### Evidence Found in Sump

In the opinion of M. Benton Mitchell, general superintendent of the Marion Division, the explosion occurred at the foot of the main hoist. He based this opinion upon the fact that a 9-in. brick wall in a sump at the bottom of the shaft, and a 10 x 12-in. oak timber, across the top of the brick, were blown outward from the sump. The heavy timber was broken in two. Because of moisture from water collected in the sump, Mr. Mitchell said that a dust or gas explosion at that point was impossible.

In the opinion of Frank Haas, mining engineer of the Consolidation Coal Co., there was not sufficient violence shown at the base of the shaft to support the theory that dynamite or nitroglycerine had been exploded there. He did say, however, according to press reports, that dynamite or nitro-glycerine could have been used at that point so as to cause a general explosion in the mine, but that it would have been necessary to use several hundred pounds of coal dust in such a way as to communicate the explosion to other portions of the mine and said he believed that this would have required more time than he believed any person attempting such a thing could have had. It would have been easier, Mr. Haas said, and much more logical for such a person to have scattered black powder on top of the lagging or cross-timbering, under a section of bad roof further back in the mine, because coal dust gathers on the lagging and ignited black powder would hastily precipitate an explosion.

A mine chart showed that the highest gas content of mine air samples taken from the mine analyzed 0.5 per cent and both Mr. Mitchell and Mr. Hass agreed that as much as a 5 or 5½ per cent gas content is necessary to precipitate an explosion. In the opinion of Mr. Haas if the mine was exploded he was inclined to believe that black powder was the agency rather than dynamite, because it leaves no trace. Less gas than usual was found in the Barrackville mine, it was testified to by an official of the company.

Stephen Arkwright, president of the Arkwright Coal Co., of the J. A. Paisley interests, a man of 50 years' experience in coal mining, testified that he believed that the explosion originated at the top of the main hoist. The shattered condition of the concrete at that point and the amount of débris at the bottom of the shaft seemed to indicate this, he said. Falling débris, he thought, may have broken the timbering and the brick wall at the bottom.

Much attention was paid to the unidentified torso. Dr. C. W. Waddell, of Fairmont; Undertaker R. C. Jones, of Fairmont, and John T. Moore, of the Workmen's Compensation Board of Charleston, testified that it is possible that the torso is that of a miner named Saunder, who was killed, but none would specifically say that it probably is. A torso lying for a month in the slate and dirt of the mine, it was testified, would shrink sufficiently to account for the difference in size pointed out between Saunder's in life and the torso when found.

### *New Orient Has Big Output*

The Chicago, Wilmington & Franklin Coal Co.'s mine No. 2, known as the New Orient, at Zeigler, Ill., made a new production record July 10, when one day's output reached 8,687 tons. This achievement is all the more remarkable in view of the fact that one hour was lost in operation and the mine is still in the development stage, the first coal having been hoisted from the main shaft Sept. 1, 1924. Prior to that time all coal had been hoisted from the airshaft, which is equipped for that purpose. The hoist at the New Orient is of the skip type, the coal being dumped into large hoppers at the bottom instead of the cars being hoisted to the tipple before being dumped. The mine is now working with about 100 men and has been averaging five days a week all summer, but much of the time it works six days a week. Much larger output is expected when the mine is fully developed, as the operators contemplate a capacity of 12,000 tons for it.

# Non-Union Mines Suffer Keenly from Overproduction as Output Mounts in Northern West Virginia Strike Zone

Dynamiting of a transmission line of the Monongahela-West Penn Public Service Co., between Lumberport and Dola, Harrison County, W. Va., early in the morning of July 20 is believed to have been the work of intruders, who sought to stop non-union coal production on the West Virginia short line of the Baltimore & Ohio R.R. Seven poles were dynamited. There are seven mines located on the line, but only two, Robey and Laura Lee, both plants of the Hutchinson Coal Co., have been active recently, and comparatively little coal could be run on Monday. Repairs were made late in the day.

Overproduction of coal at the non-union mines in the northern West Virginia strike area is beginning to be keenly felt. Not only are price levels being affected but some of the non-union mines that worked almost every day have dropped down to two and three days a week.

Rivesville mine of the Consolidation Coal Co., at Rivesville, Marion County, began to operate during the latter part of last week. From last reports 15 men were cleaning up the mine preparatory to actual production.

During the first four days of last week the non-union mines produced 5,247 cars of coal, and union plants loaded 852 cars. A new daily record for non-union production was reached July 14, when 1,334 cars were loaded. On the same day a new daily production was attained on the Monongah Division, B. & O., for open-shop coal production. Non-union plants along the Cumberland Division, B. & O., loaded 140 cars July 15, which also constituted a new day's loading record since the strike.

Union production showed some increases last week also when plants in northern West Virginia produced 235 cars on July 15, which was the heaviest daily tonnage loaded since April 18, when 247 cars were loaded.

Field representatives of the United Mine Workers have been busy gathering data in the region, and it is reported that some of the data in reference to abrogations of contracts will be submitted to the U. S. Department of Labor.

Van A. Bittner, chief international representative of the United Mine Workers in northern West Virginia, attended a conference in Philadelphia during the latter part of last week with Attorney W. A. Glasgow, of Philadelphia; Attorney Thomas C. Townsend, of Charleston, and Earl E. Hauck, of Indianapolis, connected with the legal department of the international union.

After union miners were engaged in cleaning up mine No. 1 of the Gilbert-Davis Coal Co., a large plant in Scotts Run, and had loaded three cars of coal, the men quit last week because they were not sure on what basis the mine was to be worked. The miners say that the company promised to operate the mine under the requirements of the New York agreement, but the company, it is reported, wanted concessions, and after Mr. Bittner refused to grant them the suspension followed. At last reports the mine remained idle. The company operates several non-union mines along the Monongahela Ry.

A protest was entered with Governor Howard M. Gore over the presence of C. E. Lively, a mine guard who figured in the Sid Hatfield-Chambers episode in Mingo County. The miners alleged that he was in the employ of the Bethlehem Mines Corporation at Barrackville, but later stated that it was the Chesapeake mine of the Fairmont-Chicago Coal Co., of Fairmont, and closely allied with the Fairmont & Cleveland Coal Co. At the Governor's request Lively was relieved of duty at Rivesville and later in the Clarksburg field. Under the new law for issuance of pistol licenses, which will soon become effective, the Governor has the power to revoke licenses where he deems it in the interest of peace and policy. It is reported that the Governor's representative roundly scored Marion County officials for issuing a license to Lively.

### Flemington Section Quiet

Quiet again reigns in the Flemington section, where it is said that a number of non-union coal operators have abandoned precautionary measures against mine depredations and have discharged the mine guards at some of the plants. Huge searchlights that have been in use for almost a year are being dimmed at Flemington, Rosemont and Simpson, but at Wendel, where the United Mine Workers have been picketing persistently for many months, the searchlights and guards are retained. Penitentiary sentences for three union miners and indictments pending against six others have been responsible for a general quieting down in that section. Delmar Mine No. 1, at Flemington, is being cleaned up and will work non-union within a short time.

According to reports from Wheeling, union miners at Mine No. 3 of the Paisley interests, at Elm Grove, and also at Lucy mine, across the river, in Ohio, quit July 15, due to an attempt to delay the periodical pay. The company stated that it had made large sales of coal on which it could not collect before July 20. Officials of the union advised the miners to return to work. It is reported that the miners have agreed to the plan, which is a nominal loan to the company, instead of forcing it to borrow money at 6 per cent to meet its payroll. It is said that this courtesy is being extended to Paisley interests in all of the union fields.

Federal authorities left Pittsburgh last week with Antonio Altipiede, a coal miner of Beckley, W. Va., whom they will deport from New York City to Italy as an undesirable alien. Better known as Tony Stafford, he served as international board member in District No. 29 at Beckley. He was convicted of dynamiting coal property of the E. E. White Coal Co. at Glen White in 1917, and had just completed serving five years in the West Virginia State Penitentiary at Moundsville.

**Main Shaft and Tipple, Mine No. 41, Barrackville, W. Va.**

A view of the shaft of this mine of the Bethlehem Mines Corporation in which thirty-three men were killed in an explosion March 17, 1925. After a thorough investigation an inquest held at Fairmont, W. Va., July 16, failed to reveal the cause of the disaster.

Among developments in the panhandle strike district last week was the action of Federal Judge W. E. Baker, at Elkins in sentencing Frank April, a striking employee of the West Virginia-Pittsburgh Coal Co., of Colliers, Brooke County, to serve six months in the Ohio County jail, on July 15, for contempt of court. He was accused of violating Judge Baker's injunction forbidding "peaceful persuasion."

By an agreement reached July 13, 149 union coal miners, many of whom are heads of families, will vacate houses of the West Virginia-Pittsburgh Coal Co. of Wellsburg, Brooke County. Attorneys for the coal company and the union miners came to an agreement to vacate if the men were given an additional 30 days. The miners will be housed in tents, according to William Roy, vice-president of the Ohio miners, who is in charge of the strike, and steps have been taken already to provide them. Joseph Angelio, international representative, will have charge of the miners vacating the properties. Judge J. B. Sommerville in circuit court congratulated both sides for waiving separate trials, which would have dragged out the hearings for a month or more.

Pearl Dooley, president of the Wellsburg local union of the United Mine Workers, is being held in the Brooke County jail without bond on a charge of conspiracy alleged to have been formed to blow up the Gilchrist mine of the West Virginia-Pittsburgh Coal Co. It is charged that he aided and abetted in the escape of the third of the alleged conspirators, George Johnson, brother of Jesse Johnson, a negro miner, who is charged with placing 165 sticks of dynamite in the generator and fan house of the mine, which was discovered by inspectors just before 140 employees went to work.

## Trade Information Committee Named by N.C.A.

The National Coal Association has taken steps to function as a joint agency to collect trade information from the producing units of the bituminous coal industry and to disseminate this information in summarized form. C. E. Bockus, president of the Clinchfield Coal Corporation, Virginia, heads a special committee to define such a program for consideration of the directors. The other committee members are: J. G. Bradley, president, Elk River Coal & Lumber Co., Dundon, W. Va.; H. N. Taylor, president, United States Distributing Corp., New York City; W. J. Freeman, president, Bon Ayr Coal Co., Terre Haute, Ind.; T. W. Guthrie, president, Hillman Coal & Coke Co., Pittsburgh, Pa.

Other standing committees named by President Morton L. Gould are as follows:

Executive Committee — M. L. Gould (chairman), president, Linton Coal Co., Indianapolis, Ind.; Walter Barnum, president, Pacific Coast Co., New York City; C. E. Bockus, president, Clinchfield Coal Corp., New York City; Ira Clemens, vice-president, Clemens Coal Co., Pittsburg, Kan.; W. H. Cunningham, president, Meriden Smokeless Coal Corp., Huntington, W. Va.; Michael Gallagher, general manager, M. A. Hanna Co., Cleveland, Ohio; Geo. B. Harrington, president, Chicago, Wilmington & Franklin Coal Co., Chicago; S. Pemberton Hutchinson, president, Westmoreland Coal Co., Philadelphia, Pa.; P. H. Penna, secretary, Indiana Bituminous Coal Operators Association, Terre Haute, Ind.; H. N. Taylor, president, U. S. Distributing Corp., New York City; R. C. Tway, president, R. C. Tway Coal Co., Louisville, Ky.

Finance—C. E. Bockus (chairman); S. Pemberton Hutchinson; F. W. Lukins, president, Farmers Fuel Co., Kansas City, Mo.; P. J. Quealy, president, Gunn-Quealy Coal Co., Kemmerer, Wyo.; S. H. Robbins, president, Youghiogheny & Ohio Coal Co., Cleveland, Ohio; S. L. Yerkes, vice-president, Grider Coal Sales Agency, Birmingham, Ala.

Foreign Trade—H. N. Taylor (chairman); C. W. Gibbs, secretary, Coal Operators Association of Thick Vein Freeport Seam of Pennsylvania, Harwick, Pa.; J. L. Good, sales manager, National Coal Co., Cleveland, Ohio; John Laing, president, Wyatt Coal Co., Charleston, W. Va.; R. D. Patterson, president, Weyanoke Coal & Coke Co., Lowe, W. Va.; J. W. Whatley, general manager of sales, DeBardeleben Coal Corp., Birmingham, Ala.

Government Relations—W H. Cunningham (chairman), president, Meriden Smokeless Coal Corp., Huntington, W. Va.; H. F. Bovard, president, Keystone Coal & Coke Co., Greensburg, Pa.; A. W. Calloway, president, Davis Coal & Coke Co., Philadelphia, Pa.; Michael Gallagher; Sidney J. Jennings, vice-president, U. S. Smelting, Refining & Mining Co., New York City; J. E. Johnson, secretary, Hazard Coal Operators Exchange, Lexington, Ky.; J. J. Lincoln, general manager, Crozer Coal & Coke Co., Elkhorn, W. Va.; F. S. Love, president, Union Collieries Co., Pittsburgh, Pa.; A. J. Maloney, vice-president, Chicago, Wilmington & Franklin Coal Co., Chicago; J. B. Pauley, vice-president, J. K. Dering Coal Co., Chicago; J. G. Puterbaugh, president, McAlester Fuel Co., McAlester, Okla.; P. J. Quealy; R. H. Sherwood, president, Central Indiana Coal Co., Indianapolis, Ind.; D. B. Wentz, president, Stonega Coke & Coal Co., Philadelphia, Pa.; F. W. Wilshire, vice-president, Consolidation Coal Co., New York City.

Membership—S. Pemberton Hutchinson (chairman); Walter Barnum; Ira Clemens; C. C. Dickinson, president, Dry Branch Coal Co., Charleston, W. Va.; Geo. B. Harrington; F. S. Love; Ezra Van Horn, general manager, Clarkson Coal Mining Co., Cleveland, Ohio; F. P. Wright, general manager, Crescent Coal Co., Bevier, Ky.

Publicity — Geo. B. Harrington (chairman); D. B. Cornett, president, Cornett-Lewis Coal Co., Louisville, Ky.; Telford Lewis, general manager, Jasahill Coal Co., Johnstown, Pa.; L. C. Madeira, 3d, assistant to president, Madeira-Hill & Co., Philadelphia, Pa.; W. J. Sampson, president, Witch Hazel Coal Co., Youngstown, Ohio; P. M. Snyder, president, East Gulf Coal Co., Mt. Hope, W. Va.; W. E. Watson, president, Fairmont & Cleveland Coal Co., Fairmont, W. Va.

Research—Walter Barnum (chairman); Warren Blauvelt, president, Vigo Mining Co., Terre Haute, Ind.; J. G. Bradley; Thos. DeVenney, superintendent, Portsmouth By-Product Coke Co., Edgarton, W. Va.; Marshall J. H. Jones, vice-president, Bertha Consumers Co., Pittsburgh, Pa.; M. B. Lanier, president, Monro-Warrior Coal & Coke Co., Birmingham, Ala.; J. B. Pauley; E. L. Thrower, general manager, Warner Collieries Co., Cleveland, Ohio.

Safety — P. H. Penna (chairman); Thomas G. Fear, secretary, Inland Collieries Co., Indianola, Pa.; V. N. Hacker, president, Pruden Coal & Coke Co., Knoxville, Tenn.; Cadwalader Jones, vice-president, By-Products Coal Co., Wheelwright, Ky.; M. E. Kent, general manager, Cleveland Cliffs Iron Co., Ethel, W. Va.; W. L. Robinson, vice-president, Youghiogheny & Ohio Coal Co., Cleveland, Ohio; C. W. Taylor, vice-president, W. G. Duncan Coal Co., Greenville, Ky.; J. William Wetter, general manager, Madeira-Hill Coal Mining Co., Philipsburg, Pa.

Tax and Cost Accounting—R. C. Tway (chairman); H. C. Marchant, vice-president, Superior Rock Springs Coal Co., Ogden, Utah; Otis Mouser, vice-president, Stonega Coke & Coal Co., Big Stone Gap, Va.; W. P. Tams, Jr., president, Gulf Smokeless Coal Co., Tams, W. Va.; Geo. J. L. Wulff, president, Western Coal & Mining Co., St. Louis, Mo.; Paul Zimmerman, president, Zimmerman Coal Co., Terre Haute, Ind.

Transportation—Ira Clemens (chairman); W. L. Andrews, vice-president, Consolidation Coal Co., Baltimore, Md.; J. S. Brennan, secretary, Somerset County Coal Operators Association, Somerset, Pa.; Roy Carson, traffic manager, Harlan, Hazard & Southern Appalachian Coal Operators' Association, Louisville, Ky.; E. T. Evans, general-manager, E. T. Evans Coal Co., Coalton, Ohio; T. F. Farrell, second vice-president, Pocahontas Fuel Co., Inc., New York City; C. A. Garland, traffic manager, Hillman Coal & Coke Co., Pittsburgh, Pa.; S. C. Higgins, secretary, New River Coal Operators Association, Mt. Hope, W. Va.; D. F. Hurd, secretary, Pittsburgh Vein Operators Association of Ohio, Cleveland, Ohio; C. H. Jenkins, vice-president, Hutchinson Coal Co., Fairmont, W. Va.; L. C. Madeira, 3d; E. C. Mahan, president Southern Coal & Coke Co., Knoxville, Tenn.; A. J. Maloney; C. J. Neekamp, secretary, Northeast Kentucky Coal Association, Ashland, Ky.; J. B. Pauley; C. F. Richardson, president, West Kentucky Coal Co., Sturgis, Ky.; H. N. Taylor; Jonas Waffle, traffic manager, Indiana Bituminous Coal Operators Association, Terre Haute, Ind.; C. E. Warner, traffic manager, Southwestern Interstate Coal Operators Association, Kansas City, Mo.; H. T. Wilson, president Red Jacket Consolidated Coal & Coke Co., Columbus, Ohio; A. R. Yarborough, traffic manager, Kanawha Coal Operators Association, Charleston, W. Va.

## *Virginian Plans Big Outlay For New Equipment*

The Virginian Railway Co. has applied to the Interstate Commerce Commission for authority to obligate itself for the purchase of thirty-six electric locomotives to cost $4,815,410. The locomotives are to be manufactured by the Westinghouse Electric & Manufacturing Co. and are to be of split-phase, constant-speed type of 11,000 or 22,000 volts.

The Norfolk & Western also has filed formal application for authority to lease the Virginian Ry. The purpose is stated as a desire for a western outlet, in connection with which it is proposed to construct fifty-three miles of line from Elmore to Gilbert and thence to Wharncliffe, W. Va. One of the economies which will be effected, it is stated, is the utilization by the Norfolk & Western of the excess power and electric locomotives of the Virginian company in connection with the electrification of a portion of its own lines.

## Government Still Hopes to Avert British Coal Strike

No apparent progress has been made in Great Britain toward a new coal agreement, but there are as yet no indications of a strike, according to cable advices to the Department of Commerce from Trade Commissioner C. E. Lyon, London. Separate meetings of the owners and miners, however, continue to be held. The miners have rejected the proposal of a renewed joint conference. The Miners' Federation has decided to meet in Paris on July 28 to consider joint international action if no settlement of the British situation has been reached by that time.

The government seems to be still hopeful of solving the crisis despite the mine workers' refusal to accept the proposed court of inquiry into their dispute with the mine owners. The court, it is believed, will be held whether the miners adhere to their refusal or reconsider their decision.

The government could legally demand their attendance, but such a step is altogether unlikely. The owners profess to be willing to attend the court, whether or not the miners do so.

The Ministry of Labor states that there is no possibility of a government subsidy, the present crisis being due to a general depression in the industry, making internal readjustment necessary, with both sides giving concessions. The coal situation continues to grow worse, 500 pits having been closed during the last 12 months. Unemployment reported on June 22 was 286,700 greater than a year ago. Unemployment in the coal industry accounts for much of the increase. The railway situation also is causing much concern. This problem is linked up with that of coal, as one of the tentative proposals for cutting coal prices to meet foreign competition is to reduce shipping costs. The railways, however, protest against such a reduction.

## To Tap Huge Utah Field

It is announced that the Denver & Rio Grande Western R.R. will in the near future tap a coal field of 25,000 acres in Sevier County. Sons of the late Anthony H. Lund, member of the supreme presidency of the Mormon Church, own or hold option or federal lease upon the entire area. The first filings were made thirty years ago. In the 90s the D. & R. G. W. constructed a branch line up Salina Canyon with the intention of tapping this field. The branch was completed as far as Nioche. There are about 13,000 acres of patented ground and 12,000 acres under federal permit.

Where exposed the bed is from 15 to 20 ft. thick and above it is an overburden of several hundred feet of solid sandstone from which the coal parts smoothly. It is said that the coal has a clean facing which runs from top to bottom of the seam, the floor being smooth, consisting of a hard sandstone.

It is said the railroad will spend around $1,000,000 on building the necessary branch line. An official of the road said the new branch line will leave the present main line at Salina and that it will be of broad-gage.

# Passing of Bulldozing Tactics in Wage Negotiations Gratifying to Washington Government Circles

### Launching of Adequate Statistical Program by National Coal Association Likely to Take Edge Off Oddie Bill—Success Seen in Choice of Strong Committee

By **Paul Wooton**
Washington Correspondent of *Coal Age*

Washington is rather surprised at the absence of fireworks at the first meetings of the anthracite conferees at Atlantic City. It is realized, of course, that neither side takes very seriously the interchanges that have taken place thus far. Mr. Lewis' speech was a repetition of what he has said before under similar circumstances.

A distinct impression was made by the plea of S. D. Warriner. No more temperate or dignified utterance ever was made on either side of a wage controversy, many think. The attention given his speech in the daily press was unusual in view of the absence of sensational material. It probably will not make much of an impression on the United Mine Workers, but coming at the time when the public mind was in a formative state it is expected to win much support for that viewpoint.

The tolerant, tactful utterances of Mr. Warriner are in marked contrast with those of the late George F. Baer, who was one of the spokesmen for the industry in 1902, and is more nearly calculated to win public support.

An idea of the way an outsider sees the existing situation may be had from the writings of William Hard, who compares the Mine Workers to the children of Israel and the rock in the wilderness. The children of Israel did not question how the rock produced the water that flowed from it. In like fashion the Mine Workers have been smiting the coal industry. In the past all they have had to do was to smite hard enough and the reward for their effort was forthcoming. There are no indications that the Mine Workers at this time are particularly concerned as to the source of the rock's water. The picture drawn by Mr. Warriner of loss of markets to bituminous coal, to coke, to gas and to electricity seems not to impress them. They are not interested in making a good showing on economic grounds when their chances are so much better to win if the contest can be made political. Encouragement to that end is coming from Swampscott.

Adequate statistics for coal were brought measurably nearer when Secretary Gandy of the National Coal Association induced C. E. Bockus to head the committee which will formulate the program. Perusal of the list of members of the committee is all that is necessary to show how carefully it was chosen. If any men in the bituminous industry can induce the producers of coal to submit figures it is they, but even they are certain to be put on their mettle, especially if they recommend returns on costs, realizations and margins, to say nothing of wages and earnings — figures which hardly could be expected from an organization part union and part nonunion.

The strength of this committee is evidence of full appreciation that the association no longer can forego a leading part in a thoroughgoing statistical program. Congress and the public apparently believe that figures are essential to a diagnosis of the industry's ills. There is a suspicion that refuge has been taken behind alleged fears as to illegality. As such an excuse can be advanced no longer a showdown must come. If the industry will furnish adequate figures of its own, it will take punch out of the Oddie bill and make for a better situation if the Federal Trade Commission should win the Maynard suit.

The ideal statistical set-up would be to have vigorous local associations federated into a national organization which would be a clearing house for the figures and the principal broadcasting station for their dissemination to the public. This latter is regarded as essential to compliance with the interpretation of the law as to secret figures.

As there always will be some producers who will not want to deal with an association, it is recognized that it would be extremely difficult for the industry to gather its own production figures where 100 per cent returns are essential. It also would be necessary, it is believed, for the government to gather figures on stocks and consumption—information for which the producers hardly could ask.

#### Need More Expenditure Data

The industry, in addition to the financial statistics which many companies do not want to give, could report the amount of coal shipped on contract and the amount shipped on spot. Shipments by grades also would be helpful and there is a crying need for data as to how much coal mines pay in taxes to federal, state and local governments. With the coming of workmen's compensation, insurance has become a heavy item of cost. More data covering those expenditures are needed.

For many years a dozen or more manufacturing enterprises have increased their efficiency greatly by a system of comparative costs. Each plant reports detailed costs to a central clearing house. The cost of each operation is averaged and the average figures returned to each plant. The manufacturer then is able to spot those operations in his plant which are abnormally high. It directs scrutiny to the exact point where scrutiny is needed. While these comparatvie costs are not so readily applicable to mining operations, something along that line can be resorted to profitably, it is believed. No question ever has been raised as to the legality of that type of statistical activity.

While the National Coal Association probably would not be the agency to do it, there is an increasing demand for statistics covering wages and earnings. Wage conferences in the future must be based on economic considerations. The days of bunk and bulldozing at such conferences are about to pass. The United Mine Workers already has recognized this and despite the depleted state of its treasury is spending a large amount of money in gathering these data. So far as is known no such figures are being gathered by the operators. Unless these figures are gathered they will be at a great disadvantage at the next wage conference.

## *New Premier Moves to End Nova Scotia Strike*

A move to adjudicate the strike of 12,000 miners employed in Cape Breton collieries of the British Empire Steel Corporation has been taken by the new Conservative Government in the arrangement of a conference between mine, labor and government officials. Premier E. N. Rhodes and Colonel Harrington, Minister of Public Works and Mines, went to Cape Breton July 20 to confer with company officials and leaders in the local district of the United Mine Workers. Coincident with the notice of the conference, announcement was made of an order to withdraw from Cape Breton 100 provincial police, who have been on duty in the strike area since the outbreak of rioting.

A resolution asking the new Premier-elect to insure the immediate resumption of mining operations and to extend financial relief to those now in want, to the end that "the calamity of starvation and disorders may be averted," was passed at a meeting at Sydney, July 9, of Mayors D. W. Morrison, of Glace Bay; P. G. Muise, of New Waterford; A. C. McCormick, Sydney Mines; J. L. McLean, of Dominion; Munroe, of Stellarton, and Wilson, of Springhill.

## D. & H. Stockholders to Vote On B. R. & P. Lease

A meeting of the stockholders of the Delaware & Hudson Co. has been called for Sept. 8 to vote on the proposed lease by the company of the Buffalo, Rochester & Pittsburgh Ry. Managers of the D. & H. approved the lease June 24 and the B., R. & P. directors May 1. The lease provides payment of rental sufficient to pay 6 per cent. annual dividends on the outstanding preferred and common stock and the fixed charges. In a letter to the Delaware & Hudson stockholders President Leonor F. Loree, who engineered the deal, says that he is "confident the terms of the lease are advantageous."

## White and Pugh Appointed on Mines Bureau Committee

To comply with a request from J. Edgar Pugh, president of the American Petroleum Institute, it is probable that no meeting of the Bureau of Mines Advisory Committee will be held until the end of the month. Mr. Pugh has designated D. M. Folsom, of San Francisco, to represent the Petroleum Institute on the committee. He has asked particularly that sufficient time be given for him to come East to attend. As this is written, no call for a meeting of the committee has been issued, but it is expected that chairman Reynders will comply with Mr. Pugh's request.

C. P. White, the coal specialist on Secretary Hoover's staff, will act as secretary to the advisory committee. The selection of Mr. White is regarded as having added materially to the strength of the committee. Mr. White is a retired coal operator who believes successful men have an obligation to the state which can be discharged by undertaking public service. His handling of the coal situation in the Northwest and arranging for Canadian supplies during the war is regarded as one of the most striking pieces of administrative generalship of that strenuous period. His acquaintanceship with industry and his ability as an organizer will stand the advisory committee in good stead, it is believed.

In addition to the naming of a member for the Petroleum Institute the Iron and Steel Institute has been asked to name a member. It is probable that the committee will be expanded further, as much pressure to that end already is being exerted. The difficulty in assembling a large committee with its membership drawn from different parts of the country makes it seem probable that much of the work will be done by a small subcommittee which can spend most of its time in Washington. It probably will be necessary to grant hearings to some interests who are not in accord with some phases of the Bureau's present work. Such a subcommittee would be able to reduce to their essentials all matters coming before the committee so that the committee itself could reach its decisions without undue consumption of time.

## Will Urge Ford to Link D. T. & I. to Kentucky Road

Austin Fields, brother of Governor William J. Fields of Kentucky announced July 16 that he is going to appoint a committee of Grayson (Ky.) business men to consult Henry Ford with a view to interesting him in purchasing and extending the Eastern Kentucky R.R. and linking it to the Detroit, Toledo & Ironton R.R. The Eastern Kentucky, which extends thirty-six miles from Riverton through Grayson to Webbville in Lawrence County, now is in the hands of a receiver, and persistent rumors have been afloat that service on the line will be discontinued or that the line will be junked. Mr. Fields, as president of the Grayson Business Men's Club, has been authorized to act.

Connection of the Eastern Kentucky with the D., T. & I. would mean little mileage except for construction of a bridge across the Ohio River, because the terminus of Mr. Ford's railroad is Ironton, Ohio. Construction of approximately seven miles would add forty-three miles to the D., T. & I. with purchase of the Eastern Kentucky line.

From Webbville, it is proposed that Mr. Ford cross the remainder of Lawrence County, build through Johnson and Floyd, possibly touching the southeast end of Magoffin. From Floyd or Magoffin the tracks could run through Knott into Letcher and Leslie, opening Mr. Ford's coal field for the nation.

Mr. Ford holds coal lands in Leslie, Letcher, Bell, Pike, Harlan, Clay and Perry counties, all of which adjoin Knott or the counties in which Ford has mineral property. Accomplishment of this feat probably would require construction of less than 100 miles of railroad in Kentucky. As business required, the railroad could be branched from Letcher and Leslie into other counties.

**Seward E. Button**

## Button Resigns as Official In Five Coal Companies

Scranton, Pa., July 20.—F. H. Hemelright, president of the Temple Anthracit Coal Co., this afternoon announced the resignation of Seward E. Button as vice-president and general manager of the following coal companies: Temple Anthracite Coal Co., Temple Coal Co., Lackawanna Coal Co., Ltd., Mount Lookout Coal Co. and the East Bear Ridge Collieries Co. Mr. Button was named vice-president and general manager of the above named companies in February, 1924. Previous to that he was chief of the state Department of Mines of Pennsylvania.

Mr. Button entered the coal mining industry at the age of 15 years as a day laborer at the Hillside Colliery of the Hillside Coal & Iron Co. Fifteen years later he was made a mine foreman at the Hillside Colliery and later accepted a position as foreman at the Erie Colliery, in Jermyn. Later he went to the Temple Coal Co. as superintendent of the Mount Lookout Colliery, at Wyoming, afterward becoming district superintendent for the Temple company.

He was appointed chief of the Bureau of Mines by Governor Martin G. Brumbaugh on Feb. 9, 1918. He was reappointed by Governor William C. Sproul on Dec. 18, 1919, and retired from public service in 1923 to return to the Temple Coal Co. as general superintendent. His appointment as vice-president and general manager followed.

About six months ago a report was current that Mr. Button was to succeed Mr. Hemelright, who was said to be considering retirement due to his health. Mr. Button could not be reached today to learn of his plans for the future. The announcement by the president of the company did not give a reason for Mr. Button's resignation.

## *Fist Fights Feature First Day of Convention of District 1; Reported Willingness to Cede Wage Demands Repudiated*

Violence marked the first afternoon session of the biennial convention of District No. 1, United Mine Workers, which opened July 20 in Wilkes-Barre, Pa. George Isaacs, the defeated anti-administration candidate for district vice-president, was badly beaten. He had scalp wounds, a badly bruised eye and numerous body bruises when escorted from the hall. Other fist fights were stopped only after a score of city police had been summoned.

The fights came after Mayor Daniel L. Hart pleaded for peace in the ranks of the men.

William Brennan, defeated candidate for district president, attacked the report of the credentials committee, alleging that constitutional provisions relative to the framing of the delegate list had not been complied with, and that the report was signed by only one of the board of three auditors.

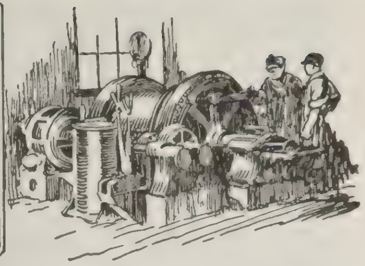
Secretary-Treasurer Enoch Williams, of Taylor, charged that Brennan had been instrumental in preventing the auditors doing their duty. Brennan denied the accusation, and there were more fist fights.

Then the administration applied steam-roller methods.

Thomas Kennedy, of Hazleton, international secretary-treasurer of the union, the final speaker of the afternoon, asked the men not to allow differences over district affairs to wreck their solid line-up on wage demands now being negotiated. The operators, he charged, are using propaganda instead of attacking the problems presented by the negotiations.

Relative to a report from Atlantic City that the men are willing to relinquish their demands for a wage advance rather than cause a strike on that issue, he asked the 600 delegates—fresh from the men in the mines and the real coal diggers, he called them—if that was the case. A loudly shouted "No" was the reply. Mr. Kennedy then asked the men at the press table to give that to the public and to S. D. Warriner and his propagandists as the reply of the men in the mines.

# Practical Pointers For Electrical And Mechanical Men



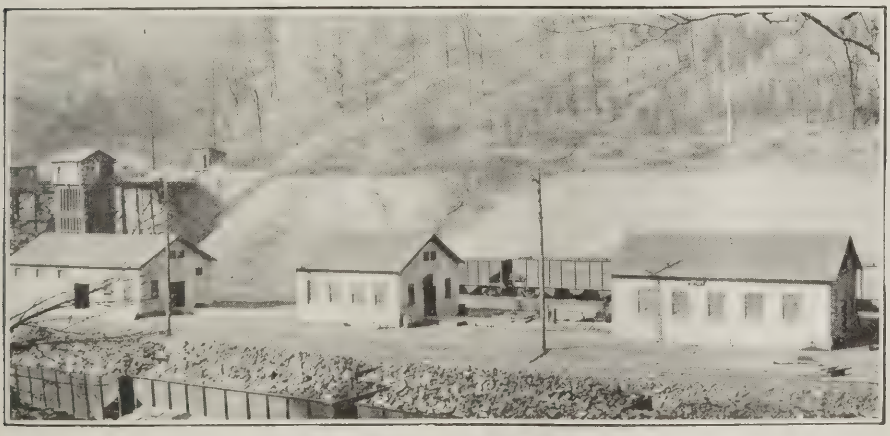
## Fire Teaches Coal Company to Build Shops in Separate Units

Some time ago the machine shop, electric shop, and storehouse of the Elkhorn Coal Corporation at Wayland, Ky. were destroyed by fire. This fire originated in the electric shop and quickly spread to the other departments which were under the same roof. The loss was heavy and the destruction of all mine supplies and spare parts, a great inconvenience.

To decrease the possibility of ever again losing all three departments by fire, the rebuilding was done as shown in the accompanying illustration. The three buildings which are of frame construction are separated by 40-ft. open spaces, and the adjacent ends covered with ⅛-in. asbestos board. A concrete walk 6 ft. wide connects the departments and serves as a runway for a portable floor crane. The open space between the electric shop and machine shop is used at odd times for a place to repair and store heavy or bulky equipment.

The three buildings are each 28 ft. in width. That to the left in the illustration, the storehouse, is 48 ft. long. The electric shop which is between the store house and machine shop, is 26 ft. long, and the machine shop 40 ft.

The Wayland shop does work for all divisions of the Elkhorn Coal Corp. The shop is directly in charge of H. C. McGlone, chief electrician of the Wayland division, and indirectly under R. R. Schellinger, electrical engineer of the company.



**Wayland Shops Are Separate Now**

These three buildings replaced the combination electric shop, machine shop, and storehouse which was destroyed by fire. As now located, with 40-ft. spaces between and with asbestos sheeting on the adjacent ends, it is unlikely that the three departments will ever again be destroyed by fire.

---

## Home-Made Wire Brush Cleans Conveyor

At the Lykens pulverized fuel power plant at the Short Mountain colliery near Lykens, Pa., the workmen at the coal storage plant had difficulty in preventing the wet fuel from sticking on the conveyor lines especially in winter. To overcome this trouble a piece of wire rope made of many strands of fine wire was opened up and located over the conveyor chain links.

The brush thus made rests lightly on the chains and prevents the coal from sticking and causing the conveyor to operate badly. This fuel is pumped from a nearby washery and breaker, it being so fine that it easily is suspended in the rapidly moving water. On the side of the hill near the power house the fuel is dewatered and placed in two large storage piles.

In winter the moisture in the fuel, even after it had been drained of water, caused the coal to freeze to the conveyor links. Now the wire brush eliminates this difficulty.

---

## Tipple Motor Starters Are Grouped Handily

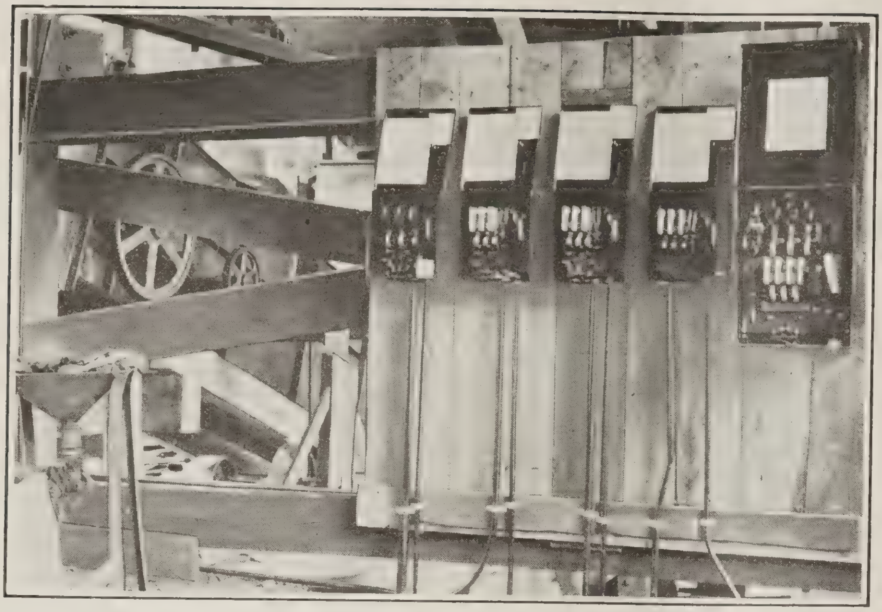
Some mine electricians still regard the automatic motor starter as a device to be used only where remote control is desirable. Often the automatic-type starter can be located in a more suitable place than a hand starter; the motors then can be started usually with less abuse; there is less burning of contacts and, therefore, the automatic starter gives less trouble and is cheaper to maintain. For these reasons some electrical men practically have discontinued buying manually operated starters, even for duty where remote control is not necessary.

An example of the use of automatic starters is illustrated in the photograph taken during the installation of shaker screens, picking tables and loading booms in the Caleb tipple of the Elkhorn Piney Coal Mining Co. at Weeksbury, Ky. Here all motors, except those on the boom hoists (which have built-in controllers), are controlled by automatic starters grouped in an accessible, well-lighted, and fairly clean part of the tipple.

An interesting feature of this installation, as explained by R. R. Webster, chief electrician, is the simplicity and lower installation cost afforded by a new-type, self-starting, induction motor. Of the two 15-hp. motors, one is the new type and the other a slip-ring motor. The only reason that both are not of the new type is that the older one had been purchased before the other was available.

The large starter at the right in the illustration is that required for the 15-hp. motor. It has a resistance mounted back of the slate panel and is a rather heavy and expensive affair. With this type starter it is necessary to carry both rotor and stator leads from the motor to the panel.

As a comparison, the small starter



**Starters Located Where They Are Easy to Get At**

This picture was taken before the wiring was completed. The large starter is for controlling a 15-hp. slip-ring motor. Three sets of wires will have to be brought into this starter for the line, the stator leads, and the rotor connection. The small starter, mounted next to the large one, controls the same size motor but one of the new self-starting type.

next to it is all that is required for the 15-hp. self-starting motor. This is nothing more than a remotely controlled magnetic switch and has no connection to the rotor circuit of the motor. The other three small starters in the picture are those used with the 5-hp. motors operating the small conveyor and loading booms.

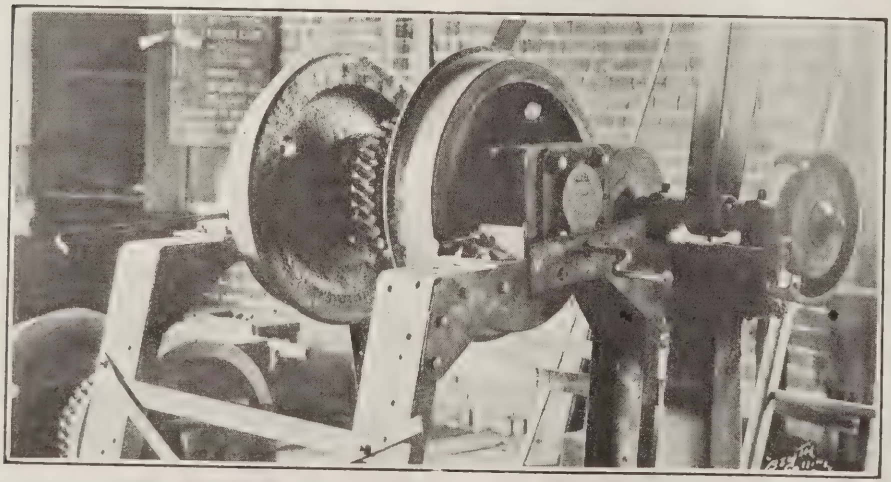
The new type of motor is not different in general appearance from an ordinary squirrel-cage induction motor. High torque and low current starting characteristics are made possible by the use of a double squirrel-cage winding on the rotor. One winding is embedded in the bottom of deep slots. The starting winding is mechanically connected and disconnected. The action is governed automatically by the inherent change in the path of the magnetic flux as the motor approaches synchronous speed.

---

## Home-Made Wheel Grinder Does Good Work

The accompanying illustration shows how the locomotive wheels of the Abbey Coal Corporation of Collinsville, Ill., are finished after the worn spots have been filled. In the building-up operation, the wheel treads are filled with manganese steel. The metal is welded into place and all depressions are built up so that the wheel is as nearly a true circle as possible.

Before the wheels are again placed under the locomotive they are ground by an emery wheel. The frame on which the wheels are mounted is set close to the emery grinder. The wheels themselves are driven while being ground. This method of finishing insures an absolutely true job. The wheels being finished when the photograph was taken belong to a narrow-gage locomotive having a worm drive.



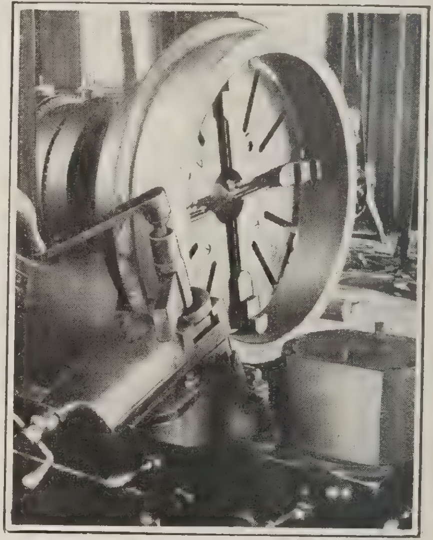
**Grinding a Set of Wheels to a True Circle**

After these wheels were built up with manganese steel they were mounted on a special frame and finished by an emery wheel.

---

## Inclined Tool Rest Raises Lathe Capacity

In many instances the lathe purchased for the mine shop is not large enough to accommodate locomotive tires. Many types can be blocked up, but if the swing is increased to any appreciable extent by this method, the carriage will be found to have sufficient travel to bring the tool post into the right position or turning large parts.

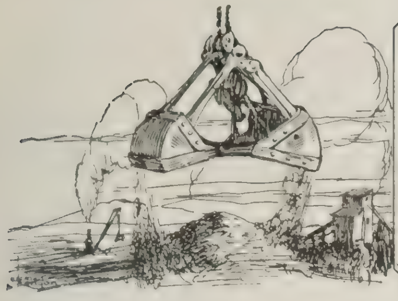


**A 30-in. Tire in a 26-in. Machine Shop Lathe**

The compound rest has been moved from the center to a new position at the end of the carriage. The inclined support, which is of cast brass, makes this possible.

A way around this difficulty is illustrated in the photograph taken in the Wayland, Ky., shop of the Elkhorn Coal Corporation. Here a 26-in. lathe has been blocked up to swing 34-in. material, and an inclined support provided for bringing the tool post into the correct position for turning 30-in. tires.

The new support was made at the Wayland shop. Through necessity it was cast from brass, the shop not being equipped to make iron castings. On the bottom of the support are machined projections which fit into the grooves of the carriage. When tires are to be turned the compound rest is removed from its regular position in the center of the carriage and is bolted to the inclined block.



# Production And the Market

## Soft-Coal Market Develops Healthier Tone; Anthracite Trade Gains Gradually

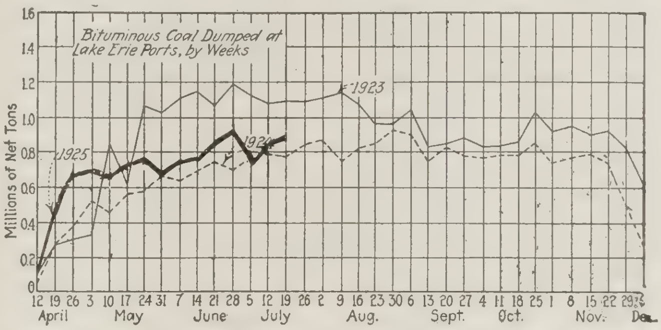
Optimism is a little more prevalent in the soft-coal market. Perhaps the best feature of the improved sentiment is the fact that it seems to have a healthy basis quite apart from the threat of a hard-coal strike. Consumers apparently are beginning to be alive to the situation, with reserves far from large and prices low, and it is expected that demand will gain in momentum steadily from now on. No doubt news from the wage conference at Atlantic City will play its part in the market as already the threatened tie-up of British mines has stiffened the market at Hampton Roads.

The Midwest market is showing more signs of life, and while the improvement has been largely on Eastern coals it is expected that Illinois and Indiana operators will soon share in the betterment. Demand is picking up steadily in Kentucky and prices are beginning to climb. The advance in prices is being accepted in a way that would seem to indicate that business is due to improve steadily. Eastern Kentucky screenings in particular are unusually firm for midsummer. Conditions are extremely dull at the head of the lakes, the iron mines having failed to open, as expected. The situation in the Southwest is somewhat firmer, a few mines in Kansas having reopened and several in Arkansas are preparing to resume. Trade is dragging in Colorado and Utah.

The Cincinnati market is somewhat complicated, embargoes on the B. & O. causing a backwash, with a slight softening of prices. Lake buyers, however, have come into the market instead of sellers having to go after them. Domestic demand continues to improve gradually in southern Ohio and the steam trade remains about normal. A slightly better tone is in evidence in eastern Ohio, though steam buying is largely limited to current needs. The Pittsburgh market is stagnant. New England, New York and the other Eastern markets bear a somewhat healthier aspect, soft spots being less in evidence.

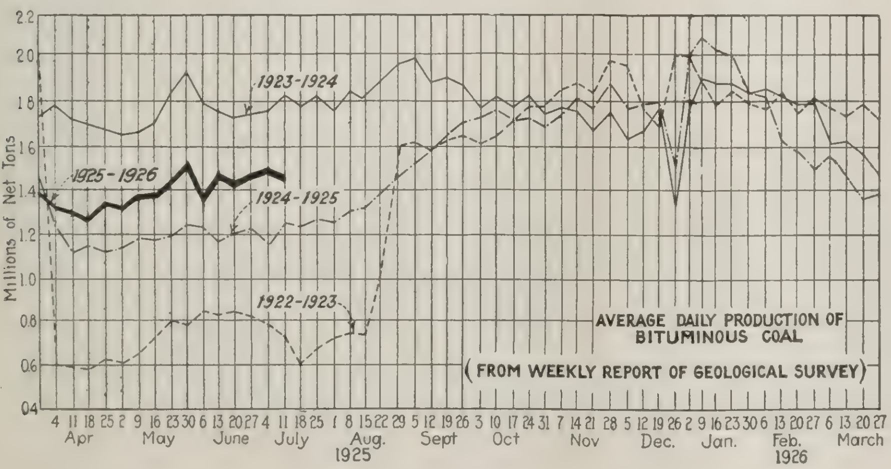
A gradual increase in demand accompanied by greater firmness of independent prices marks the anthracite trade, though the gain has not been as great as was expected.

Bituminous coal output in the week ended July 11 is estimated by the Geological Survey at 8,631,000 net tons, compared with 7,352,000 tons in the holiday week, preceding. Anthracite production in the week ended July 11 was 1,854,000 net tons, compared with 1,514,000 tons in the week ended July 4.



*Coal Age* Index of spot prices of bituminous coal showed no change during the past week, standing on July 20 at 160, the corresponding price being $1.93.

Dumpings at Lake Erie ports during the week ended July 19, according to the Ore & Coal Exchange, were: Cargo, 831,252 net tons; steamship fuel, 50,131 tons—a total of 881,383 net tons, compared with 831,890 tons in the preceding week. Hampton Roads dumpings in the week ended July 16 totaled 351,037 net tons, compared with 468,804 tons in the previous week.



### Estimates of Production

(Net Tons)

| | 1924 | 1925 |
|---|---|---|
| **BITUMINOUS** | | |
| June 27 | 7,608,000 | 8,662,000 |
| July 4 (*a*) | 5,913,000 | 7,352,000 |
| July 11 (*b*) | 7,742,000 | 8,631,000 |
| Daily average | 1,290,000 | 1,438,000 |
| Cal. yr. to date | 243,427,000 | 247,763,000 |
| Daily av. to date | (*c*) 1,503,000 | 1,528,000 |
| **ANTHRACITE** | | |
| June 27 | 1,918,000 | 1,844,000 |
| July 4 | 1,296,000 | 1,514,000 |
| July 11 | 1,871,000 | 1,854,000 |
| Cal. yr. to date | (*c*) 48,312,000 | 47,803,000 |
| **COKE** | | |
| July 4(*a*) | 94,000 | 120,000 |
| July 11 (*b*) | 106,000 | 126,000 |
| Cal. yr. to date | (*c*) 6,204,000 | 5,477,000 |

(*a*) Revised since last report. (*b*) Subject to revision. (*c*) Minus two days' production to equalize number of days in the two years.

## Midwest Trade Shows Signs of Life

The Chicago market tone is infinitely more encouraging than it has been since the close of the winter season. As was intimated a week ago, the market is beginning to pick up and show some signs of life. Most of the activity and the improvements to date have been on Eastern coals, but it is confidently expected that better conditions are in prospect in the near future for the Illinois and Indiana operators.

Relative to improved conditions in the East, a number of the smokeless operators represented in Chicago have been forced to withdraw all prices temporarily on high-grade smokeless coals. Eastern Kentucky and splint operators have raised their quotations from 10c. to 25c. a ton. Low-price contracts on smokeless mine-run offered to dealers and not accepted to date have been withdrawn and a new set of figures showing a considerable advance submitted in their place.

Franklin County and Saline County operators report a little better business on domestic coals, which also is true of Indiana Fourth Vein operators in the Clinton and Linton districts. Steam coals are erratic and there is a wide variance in quotations on screenings from the same field, principally because some operators are in good shape and others not so good. Renewed interest in contracts is being shown by industrial consumers, with some operators holding back, going on the basis that having gotten along so far without contracts they can probably finish up the year without them.

There is a little activity in spots in the Franklin County field—a couple of mines have opened, but working time is not good. There seems to be heavy railroad buying in the last ten days from this field and from the deep-shaft mines. This has enabled some of them to make some good showings. On good authority it is learned that a few Western railroads are putting in storage coal. One road is reported as considering a storage pile of 100,000 tons for July and the early part of August. This is helping the situation in the Williamson and Franklin County field and to some extent is helping the Harrisburg field.

There has been a little pickup in domestic movement of lump and egg, which indicates that from now on an improvement can be looked for steadily.

Steam is fairly active in screenings but slowing up in the nut sizes. Strip mines are making good working time on both steam and domestic, and all mines still continue to do some crushing. Working time at the shaft mines still runs from one to three days a week, with the usual exceptions. Conditions show no improvement in the Duquoin field. One and two days a week, with one mine getting three days, is the rule, but the strip mines show good working time and stripping developments in this section promise to increase.

## Current Quotations—Spot Prices, Bituminous Coal—Net Tons, F.O.B. Mines

| **Low-Volatile, Eastern** | Market Quoted | July 21 1924 | July 6 1925 | July 13 1925 | July 20 1925† |

**Coal Age Index of Spot Prices of Bituminous Coal F.O.B. Mines**

| | 1925 | | | 1924 |
|---|---|---|---|---|
| | July 20 | July 13 | July 6 | July 21 |
| Index | 160 | 160 | 160 | 163 |
| Weighted averaged price | $1.93 | $1.93 | $1.94 | $1.98 |

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States, weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and, second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke; 1913-1918," published by the Geological Survey and the War Industries Board.

In the Mount Olive field conditions are still bad. A little tonnage is moving, for steam principally, and one or two days a week is considered good working time. A little railroad tonnage also moves.

In the Standard field there is little improvement. The movement of early storage for St. Louis did not develop as was expected; all mines have "no bills" on hand, and domestic sizes are hard to move. Railroad tonnage is high and one and two days a week is good working time. Prices are unchanged.

At St. Louis there is a little activity in early storage of southern Illinois high-grade coal, but other than that, retail conditions are slow. Apartment-house early storage is not developing fast for Standard coal, and Mount Olive seems to be at a standstill. There is no activity in anthracite or smokeless and very little in coke. Wagonload steam is slow, and carload is active for screenings only in a fair way. Country domestic in spots shows improvement, but country steam is slow.

### Demand Improves Steadily in Kentucky

A much better spirit is prevalent in the Kentucky coal trade than at any previous time in months. Demand is improving steadily and prices are starting to advance. Buyers are taking to increased prices a little better than had been anticipated, and it is believed that business will steadily improve.

In western Kentucky prices have started advancing on prepared, but screenings are a bit weaker as a result of larger production. In eastern Kentucky block is a trifle stronger, while all other sizes are firm. Movement is generally better, however.

Western Kentucky is now quoting block at $1.50@$1.65, with some prime 6-in. at $1.75; lump, egg and nut, $1.40@$1.60; mine-run, $1.10@$1.25, and screenings, 80@95c.

Eastern Kentucky is selling some block at $2, but prices are closer to $2.25@$2.50, with some fine grades even higher. Lump and egg are $1.75@$2.10; nut, $1.50@$1.75; mine-run, $1.35@$1.75, and screenings, $1@$1.25.

A feature of the market is the firm price on eastern Kentucky screenings, at $1 and up, which is unusual for midsummer, but made possible by a good general industrial, utility and steam demand, as well as a larger movement than usual to the lakes for bunkerage use.

### Faint Signs of Life in Northwest

The situation is still very dull at Duluth as far as shipments from the docks go. A little more anthracite moved last week than before, however, and there seemed to be some sign of life in the bituminous industry. The unexpected move of anthracite probably is due to the big consumers, who burn hard coal regardless of price, filling their bins for the year, and in some instances the small man's fear of a curtailment of the supply.

Coal men say, however, that unless there is a material reduction in the price of hard coal, more Pocahontas will be burned this year than ever before. The spread in price between the poorest hard coal and Pocahontas is more than $5 a ton, delivered.

Forty-nine cargoes arrived last week, which was an improvement over the week before. Of these, only three were hard coal, showing that the docks are leary of putting in too big a supply of anthracite. There are 14 cargoes on the way, of which three are hard coal.

Mines on the range are proving a disappointment, as they are not opening up. Prices remain the same all through the list, with no signs of weakening.

Both dock managers and retail dealers in Milwaukee reported a better demand for coal last week. Householders evidently have been moved to action by talk of a possible strike in the anthracite region in September, as the temperature has been high enough thus far during July to keep them serene as to fuel requirements. But the bins must have filling in a few weeks, and the activity now noted is the forerunner of a steady demand that will draw heavily upon dock supplies. Cargoes are coming to Milwaukee quite steadily. Receipts during July, up to the 16th, aggregate 216,766 tons—45,100 tons of anthracite and 171,666 tons of bituminous coal. This carries the total for the year thus far to 1,333,139 tons, against 1,118,381 tons during the same time in the season of 1924.

### Firmer Tendency in Southwest

The Southwestern market is becoming firmer. Dealers are beginning to buy in small quantities, though the principal demand continues to be for school storage and threshing. Some operators are preparing to reopen their Arkansas mines, where now there is little activity. Several small mines have been reopened in Kansas in recent weeks, though a market sufficient to warrant a general resumption of work is not expected now before late in August.

There is very little change, if any, in the coal conditions in Colorado. Mines are operating about two days a week, demand for domestic coal being virtually nil, as dealers are holding off orders until the new rates become effective.

The coal business continues draggy in Utah. Orders from industrials are no better than they were and the hot weather has reduced domestic consumption to practically nil. Coal for storage purposes is moving slower than normal. Prices are as steady as ever. Prominent retail concerns are issuing circular matter urging the public to store coal now for winter use. These circulars predict an advance in coal prices in the fall. Prices have not been changed here since last September, when there was an adjustment following the granting of storage rates. There is little contracting and business is quiet all over the territory served.

### Embargoes Bring Softness at Cincinnati

Embargoes by the Baltimore & Ohio against coal moving from south of the river to Toledo caused a slight backwash at Cincinnati that was felt principally by shippers and handlers of mine-run during the past week. This caused a little softening, and those with a Chesapeake & Ohio outlet turned their offerings to tide. On the other hand, lake buyers, probably for the first time this season, came to the market instead of sellers going to them, and this is always a healthy sign.

In the bituminous line-up lump and block still lacked activity. The mid-month price advance by some of the Logan County (W. Va.) producers added a better tone, inquiries too were better, but quite an amount of tonnage still could be picked up around $2 in spite of the fact that $2.25 was asked and $2.40 was sought by some southeastern Kentucky shippers. Egg and 2-in. are unchanged, and slack, in spite of the softening of mine-run, stood at the old figures.

Smokeless coals are firmer in price than for the past couple of weeks. Some direct-sales offices are making a determined effort to get $3 for lump, though a distinction is still made against egg. Some mines ask $2.85 for egg, a 10c. advance, and mine-run is firm at $2 with little of the standard offerings below that mark. Screenings have had a better inquiry, but the price is practically unchanged.

There has been no change in the retail situation, though an advance Aug. 1 seems certain. If this happens it will be the first upward change since last March.

Recent rains have given the river a good stage and assurance of decent depth for some time to come.

The gradual improvement in the domestic demand in Columbus and central Ohio continues. Retailers in many sections are placing better orders in view of the fact that more householders are coming into the market. Rural dealers are buying in order to take care of the threshing business, which, however is not nearly as important as formerly. Retail prices have stiffened to a certain extent with smokeless, splints and Kentucky block the favorite varieties.

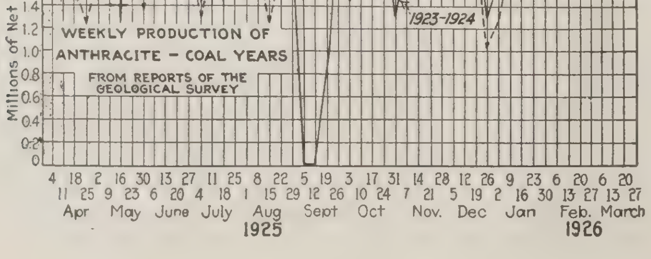
Steam business is running along about as usual, with some larger orders coming in where reserves are unusually low. But contracting has not been increased although some of the larger users are making inquiries on large tonnage. Railroads and utilities are the best steam buyers. Manufacturing concerns have not been able to increase their operations and are playing safe on the fuel proposition. The market has been kept fairly clean because of buying by general steam users and there is little distress coal reported on the Columbus market. Open-market buying is still the rule among larger users. Screenings are still firm, largely through the curtailment of lump output. The tone of the steam trade has improved materially during the past two weeks and producers as well as distributors believe that better things are in store during the latter part of July and in August.

The lake movement continues steady with some of the tonnage coming from Ohio mines, especially those working under the 1917 scale. Lake contracting is slow, however, as most of the shippers have placed their contracts for the season.

Production in the southern Ohio field shows little increase and is estimated from 20 to 25 per cent of capacity. Some trouble is reported following agitation on the part of union officials in sections where co-operative mining is prevalent. A few more mines are opening with the 1917 scale as a wage basis.

## Improved Tone in Eastern Ohio

In eastern Ohio last week saw a stronger demand for slack and nut-and-slack, with an enhancement in spot prices of 5 to 10c. per ton. Spot prices on other grades show practically no change. The market manifests a slightly improved tone, however; retailers are beginning to purchase and store for fall trade and inquiries from steam consumers are more active. The major portion of the steam trade nevertheless is adhering to small-quantity purchases for current use.



During the week ended July 11 the total output in eastern Ohio was 226,000 tons, an increase of 43,000 tons over the preceding week, which consisted of only five workdays.

## Pittsburgh Market Stagnant

The Pittsburgh market continues as dull as ever. The movement between operators and regular customers, such as it is, keeps up, but the amount of inquiry in the open market for mine-run and lump is almost negligible. As usual, there is some trading in slack and there is occasional inquiry for nut.

There is room for hopes of improvement in the general coal situation, but the Pittsburgh district is so far out of the competition as to meeting prices in its formerly widespread markets that a little improvement would do it no good. For months past the district's market has been almost entirely a local affair.

There is no change in the bituminous situation at Buffalo. Prices are at the bottom and will remain there for a while at any rate. Shippers are pleased if they can grab up enough business to pay expenses. Many assert that they are unable to do it. Quotations are $1.60@$1.75 for Fairmont lump, $1.40@$1.50 for mine-run, $1.25@$1.40 for slack; $2.25@$2.50 for Youghiogheny gas lump, $2@$2.25 for Pittsburgh and No. 8 steam lump, and $1.40@$1.60 for slack; $1.75@$2 for Allegheny Valley mine-run. Cambria County smokeless sells at the curb, for house furnace use, at $6.

## New England Steam Market Healthier

The steam coal market has a more wholesome appearance in New England. Much less tonnage is being forced on reluctant buyers and enough sales have been made in the last fortnight to eliminate most of the soft spots that were typical when July came in. Receipts continue on a light weekly basis, but the trade is more hopeful and there is an inclination now to be deliberate about futures. Coal is still being sold for September delivery at today's quotations for spot shipment, but the range of prices is at least 5@10c. higher than a week ago. A few orders that have come into the market in the past week were taken at better prices than had obtained for several weeks, and unless some group of smokeless operators make overshipments here there is reason to think the market is already on a sounder footing than has been the case for many a day.

It is doubtful whether there will be any marked response on the part of buyers; so many favorable predictions have been made in the past three years that most of them will be very slow in reacting. At the same time there is quite an aggregate tonnage to be placed before November, and all these conditions in the steam coal trade will call for careful handling in the next few weeks.

Accumulations at Hampton Roads did not bulk so large last week, and admittedly there is a better feeling among the agencies. The British labor situation has been a source of some encouragement, although no tangible results have as yet appeared.

Pocahontas and New River of the higher grades are being held at $4.25@$4.35 per gross ton, f.o.b. vessel, with slack commanding close to $4 at the same ports. On cars Boston there have been sales recently at $5.35@$5.40, although for 1,000-ton lots a discreet buyer could doubtless cover at $5.25@$5.35.

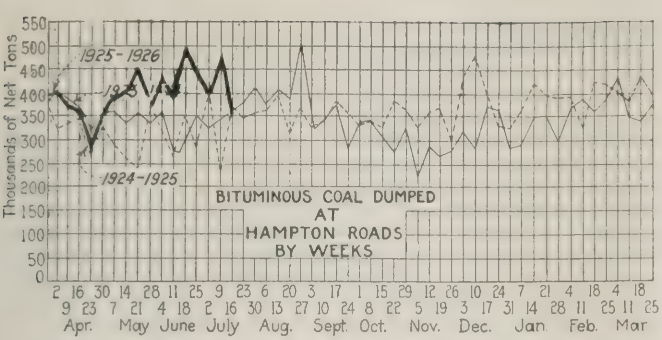
In Pennsylvania coals all-rail there is next to nothing doing. The few mines that are in operation are still selling on about a cost basis.

## Tonnage Moves Better at New York

Better feeling and a slightly improved movement of bituminous coal are apparent at New York and lead to the belief that notwithstanding their apparent indifference, consumers are looking into the future. They are watching the anthracite situation closely and producers of screened coals are prepared to take advantage of conditions should there be a suspension of mining.

Cheaper grades apparently are in the discard due to the low prices at which the better grades can be purchased. With the improvement becoming stronger salesmen look for the placing of many orders that have been held back for some time.

The tidewater market remains practically unchanged. Shippers are cautious in sending tonnage to the piers.



Mid-July has brought no improvement to the Philadelphia soft-coal market, although there has been a little contracting on account of some agreements having expired. Part of the trade reports more business, although all deplore the fact that it is about an even break so far as profit is concerned.

Producers are trying to induce regular customers to stock up coal, as the tonnage above ground is close to the smallest on record and anthracite strike talk is in the air. The possibility of trouble in the British coal fields has not escaped the attention of local operators.

Slack continues to be a wanted fuel, and the large users of this coal are in the market for surplus fuel for stocking as well as for current consumption. The demand has been quite well met of late, but, of course, there has not been sufficient to meet all calls.

Tide trade is as quiet as ever, although there seems to be an occasional better demand for bunker coal. No charters for overseas shipments have been closed for weeks.

One week is almost like another these days in the Baltimore coal trade. A few companies handling better grades have contracts that cover considerable of their production possibility for some months, but a number of others are far behind in the average contract situation and are selling a considerable part of their present reduced production at prices that are far from satisfactory. It is true that there is more inclination to store as fall approaches and the possibilities of an anthracite strike affecting the bituminous situation prove more acute. Some of the large industries have abandoned the policy of merely buying for immediate needs and are creating reserves, but this is far from general. Less desirable coals are especially difficult to sell, bringing prices that prevent profits. In the face of European production complications export movement is flat. Quotations are about the same as for several weeks past, high-grade steam coals being easy to obtain at from $1.65 to $1.85.

At Birmingham disposition of domestic coal is still most troublesome. With unusually hot weather dealers are doing little business, most of them having ample coal on hand to meet straggling demands. There is little spot buying and deliveries on contracts are being extended and restricted to a menacing degree. There is scarcely any movement of the cheaper grades of lump and other domestic sizes.

The commercial market is about holding its own. Inquiry is light and sales of spot coal have not increased materially, if at all. A few new contracts are reported, but coverings are mostly confined to renewals. The Central of Georgia Ry. and the Ocean Steamship Co. completed the list of the large utilities to make contracts when they closed last week for something over 800,000 tons of washed coal from the mines on the Central lines. The bunker trade is still dull and requirements light.

Prices f.o.b. mines are reported remaining within the schedules which have ruled for the past month or more. While demand is limited for both steam and domestic grades, mines are operating with this situation in mind and there is no surplus of serious proportions of any grades.

## Hard Coal Trade Gains Gradually

Demand and quotations for independent anthracite showed several changes at New York last week, with the result that prices for individual coals registered an increase. Demand is not as strong as expected in view of the uncertainty of wage negotiations, but this does not seem to bother consumers, who apparently believe there is enough coal above ground to take care of their needs no matter if there should be a suspension.

Some of the larger companies are said to be sold up on egg and stove but find difficulty in disposing of chestnut unless taken with either egg or stove. Independent coals are moving steadily with the exception of chestnut. Pea is in good shape and No. 1 buckwheat has picked up considerably. Surplus tonnages of rice and barley are going to the storage piles.

Retail dealers complain of the slowness of business and are endeavoring to stimulate the storing of winter fuel.

At Philadelphia the anthracite trade is a bit improved, though the operators seem to have as much difficulty as ever to move their coal. The real impetus comes from the conference at Atlantic City, for even dealers who were inclined to withhold buying are now ordering better.

Independents are reported to be moving blocks at 25c. under company price on nut and as much as 50c. on pea. Retail prices are little, if any, changed. Some few dealers have increased about 25c., while others are anxious to do so, but are afraid of the effect it will have on their business. So far most of them have absorbed all the monthly raises.

Steam sizes are extremely quiet and the storage yards of company shippers still get a surplus that cannot be sent to market. The independent shippers are selling off price from 25 to 50c. on buckwheat and about 25c. on barley and rice. Of all the sizes barley continues to be in strongest demand.

Among dealers in Baltimore the feeling is growing that there probably will be a strike, but that it will not be of great duration. Fair stocks are on hand, as the public has not been buying heavily and the majority of coal merchants have kept ahead each month in receipts as compared with orders on their books. While some dealers may add additional supplies during the coming months, it is not likely that there will be any heavy storing unless conditions change materially. It is pretty sure that the retailers here will have to advance retail prices Aug. 1. The present schedule was created for June, the retail trade absorbing the wholesale advances that took place July 1.

At Buffalo there has been a better sale of anthracite lately, apparently in the belief that there is to be a strike. The increased demand is not insistent, but it will be if the meetings on the wage question come to nothing, as seems likely. Most of the retailers report that up to this time they have sold less coal for house use than in former summers.

New concerns are offering coke, so it seems that that trade is to be pushed anyhow, and besides that there is a new smokeless vein developing that is to be put on the market. The oil distributors also are active.

Lake shipments are still running down. For the week they were only 17,800 tons to Duluth and Superior and 2,000 tons to the Sault. Rates are unchanged.

## Connellsville Coke Market Hopeful

The accumulation of furnace coke on track at Connellsville has now been practically all worked off. The high point was about the middle of May, with more than 25,000 tons. This was in strong hands, not disposed to peddle or sacrifice it, and the bulk of it was gradually worked off on contract shipments, a little being exported.

There is talk now that the spot furnace coke market is stronger. It seems still to be quotable at $2.75@$2.85, but some sellers seem to hope soon to be able to get $3. This is doubtful, however, for it has just leaked out that one of the last contracts made was at $2.85, this being for the entire half year. Contracting in general was at $3. It is now said that with a fairly heavy operation there would be no loss at $2.85.

Spot foundry coke is moving a little better, but in general must be described as dull. The market remains quotable at $3.75@$4.25, this being for standard foundry coke, i.e., 72-hour selected. Some coke is sold for foundry use at lower prices, not fully standard.

# Foreign Market And Export News

## British Coal Market Unsettled by Threatened Suspension

Conditions in the Welsh steam coal trade are growing more disquieting owing to the unsettled situation created by the prospect of the termination of the miners' wage agreement at the end of July. The trade is most concerned about whether there will be stoppage at the end of July. New business has not come forward very readily of late, but in view of the possibility of a stoppage the colliery owners, while willing to sell coal for spot shipment on the basis of recent levels, are asking enhanced figures for later delivery. They anticipate that depot owners and other consumers abroad will come on the market for considerable supplies for stock to meet the contingency of a general stoppage.

With so much uncertainty in the national coal position it was inevitable that local conditions should be somewhat erratic in the Newcastle-on-Tyne coal trade. The possibility of a stoppage may have a stiffening effect, but it is not apparent yet, and in any case will be an artificial improvement. In the coal tonnage chartering market rates have been fairly steady, but, owing to local holidays, the volume of business has been on a small scale. The only important inquiry in the market is that of the Latvian State Rys. for 50,000 tons of Northumberland, Durham, Yorkshire, Scottish or Monmouthshire steam coals to be delivered from September to the close of navigation.

Production by British coal mines in the week ended July 4, a cable to *Coal Age* states, totaled 4,675,000 tons, compared with 4,420,000 tons in the preceding week.

### Hampton Roads Trade Unsettled; Market Tone Firm

Business at Hampton Roads last week was unsettled, pending the outcome of negotiations on which a possible hard-coal strike will be based. No coal was being sold ahead under any circumstances, everything being on a spot basis. Prices, however, remained practically unchanged. The output coming to this section was about normal, all mines running on a basis of three days a week. Some impetus has been given trade by foreign shipments, said to be provided for in anticipation of a British strike. The tone of the market was firm.

The Smokeless Fuel Co., agent at Norfolk for the P. L. M. French line of steamers, has arranged for shipments of about 500,000 tons of coal to French and English ports. It will be carried on the P. L. M. line, and several shipments have already gone forward.

### Purchases at Low Level in French Market

The French coal market continues quiet. Orders cover only the most urgent needs and then not overgenerously; concessions in consequence, have become, for the time being, a commercial habit.

Since July 1 the Loire collieries have reduced the men's salaries from 0.50f. to 0.30f. daily. In manner of protest against this measure, extremists have resorted to provoking agitation, but it is not likely that a strike will intervene.

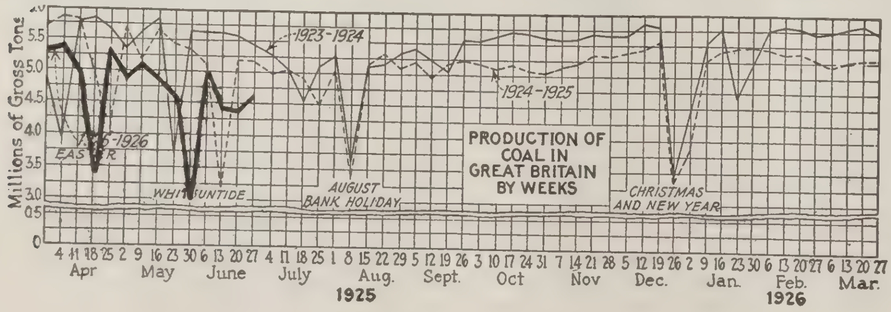
The promises made to the North and Pas-de-Calais mines, relative to a reduction in transport tariffs and the reestablishment of import licenses on German coal not having been kept it is possible that these collieries will eliminate entirely the allowance for high cost of living, which had been cut to half of its original amount.

Beginning July 10 anthracitic sized coals from the Ruhr (reparation fuels) were advanced 10f. per ton.

### All Grades Quiet in Belgium

The Belgian coal market is as unsettled as ever on industrial grades, the outlet for which is worse since consumption by metallurgists has fallen to naught, due to a strike. The slide of the franc, however, hinders foreign competition.

With regard to household fuels the situation is by no means bright, except for anthracite, which continues scarce.



Negotiations on a new wage convention have missed fire. The employers had proposed that wages be established in harmony with the basis furnished by the index number, but that in case of a crisis or a boom, salaries should be swayed by the price of coal, without, however, falling below 15 per cent of the basis furnished by the index number. A cut of 5 per cent was to have been applied July 1, but in consideration of present circumstances the operators have decided to postpone its application until Aug. 1.

# News Items From Field and Trade

## ARKANSAS

Chancellor W. E. Atkinson early in July granted an injunction to mine operators of the Clarksville Chancery District against District No. 21 of United Mine Workers and all local unions, restricting them from interfering with the operating of mines in this district, all intimidating methods and destructions and all wrongful assembling which would cause any violation of those restrictions. The plaintiffs are: Bernice Anthracite Coal Co., Collier-Dunlap Coal Co., Werner-Dunlap Coal Co., Arkansas Mining Co., of Clarksville; Semi-Anthracite Coal Co., of Coal Hill. It is not believed the injunction actually will prohibit public gatherings of the miners, such as were held at Clarksville, Paris and Russellville so long as the men conduct themselves in such a manner as will comply with the terms of this injunction.

J. G. Puterbaugh, of McAlester, Okla., announces that the tipple of the Backbone mine, Excelsior, near Fort Smith, is to be rebuilt at once. It was destroyed by fire late in June.

Lewis Noland and Albert Wilson, of the Pleasant View community, northwest of Atkins, have struck coal in their new shaft.

## ILLINOIS

Frank Lutz and Orley Grissom are sinking a new coal mine just east of Astoria. The shaft will be about 50 ft. deep and a steel cage will be installed to be operated by electricity. The bed of coal is 5 ft. thick and is of excellent quality.

The prolonged slump which the mining industry has undergone in Illinois, as well as in many other states, was reflected in an interesting manner when Attorney Cairo A. Trimble, Princeton, filed a petition with the board of review of Bureau County asking that the assessed value of the coal rights owned in that county by the Spring Valley and St. Paul coal companies be reduced from $10 an acre to $1 an acre. Mr. Trimble, in his petition, alleges that coal mining in northern Illinois, as an industry, has been practically wiped out and that the assessed valuation of the two coal companies which he represents is much too high.

The Kerens-Donnewald coal mine at Worden, owned by the McKinley System, which has been closed for a year and a half, has steam up again and a corps of men have been put to work cleaning up the débris in the mine. The movement to start the mine has been launched by the residents of Worden, who expect to operate it as a home trade mine if their venture is successful. Some time ago it was made known that the McKinley interests did not expect to operate the mine again, but intended to junk the machinery. The mine was originally sunk by the Kerens-Donnewald Coal Co. about 25 years ago.

The McLean County Coal Co., Bloomington, plans to reopen its mine in the near future, with M. B. Stewart, a graduate of the mining engineering department of the University of Illinois, in charge.

Mine No. 7 of the Franklin County Coal Co., at Royalton, which had been down since last February, resumed operation July 16.

Stoughton, Bates and Foster, who operate the new coal mine at Repatee, a few miles from Galesburg, have their new mine in working order. The mine is located on the main highway between Maquon and Farmington.

"Old North," the Taylor Coal Co.'s mine at Royalton, started work on July 15. The mine suspended operations last April. An agreement was reached July 11 between union officials and company representatives concerning certain points in the working agreement that were in dispute.

The Ladd mine, a few miles from Princeton, has been sold by the Illinois Third Vein Coal Co. to Peter Bergandi, a former coal miner, for $5,000. The property consists of sixty-five acres of surface land and all buildings which have been left upon the premises. The mine, once the largest in northern Illinois, has been closed since last fall, when the stockholders concluded to abandon the mining business at Ladd because of heavy financial losses caused by the inroads of non-union West Virginia and Kentucky coal. In its palmy days this mine property was worth at least $100,000. Twenty of the sixty-five acres has been grazing land for mine mules for at least thirty years and is rich, fertile land.

The Nason Coal Co., Nason, has received an order for a carload of coal from Houston, Texas, which makes the eleventh state into which coal from Jefferson County is being shipped at the present time. The Nason mine is disposing of all the coal it can mine at this time and is making arrangements to increase production as rapidly as possible.

The coal mine of the Indiana & Illinois Coal Corporation, of Chicago, located in Nokomis, was closed down recently, throwing 800 men out of employment. Officials of the company announce that the mine will be reopened about Aug. 1, when repairs now being made on the main shaft are completed. All the mines operated by the corporation in Montgomery County, located at Nokomis, Witt, Taylor Springs and Kortkemp, are closed down at the present time. The shaft located at Nokomis has a hoisting record of over 6,000 tons per day, and when running at full capacity employs over 1,200 miners.

## INDIANA

Following not guilty verdict by a jury at Terre Haute in the case of Vincent Povelight, mine shotfirer accused by state mine inspectors of firing illegal shots, the question came up of whether the other forty-odd miners facing similar accusations should be tried or dismissed. "I will put the case up to the state mine inspectors," said Assistant Prosecutor Littlefield. "If they wish to try the cases, we will go ahead, either separately or make one case out of all, as they wish. Otherwise, the remaining cases probably will be dismissed."

The Eastern Coal & Export Corporation has filed a certificate of withdrawal from the State of Indiana.

The United Electric Coal Co., a Delaware corporation and operating in two Illinois fields, plans the expenditure of about $2,225,000 in the next eighteen months in developing of tripping operations in Vigo and Sullivan counties. The company will erect two units this year, two next spring, two a year from now and two the following spring. Each unit will consist of one stripping shovel and one loading shovel. This machinery is capable of mining and loading about 1,000 tons of coal daily. Operations will continue the year round. It is the intention to build an enormous steel tipple at some convenient place in the field so that not only mine-run but various kinds of screened coal may be shipped.

## IOWA

The Pershing Coal Co. has obtained options in Whitebreast township, near Laomi, and expects soon to begin drilling for coal.

In order to demonstrate the advantages of coke as furnace fuel, the M. W. Warren Coke Co., of St. Louis, in co-operation with the Carbon Coal Co., Des Moines, local agent for the former company, has fitted up a furnace demonstrator on a truck. The exhibit makes the rounds of Des Moines streets. A representative of the coke company accompanies the lighted furnace, which is drawn about the streets of the city with a team of horses. At intervals he stops the truck and explains coke burning. The furnace was lent by the Green Foundry & Furnace Works of Des Moines.

## KANSAS

Repairs at mine No. 51 of the Central Coal & Coke Co., in the southeastern Kansas field, which was closed down several weeks ago, have been completed by July 15, and the mine is in condition to be reopened. Its normal production is between 1,100 and 1,200 tons a day. It employs 350 men.

The Kansas Supreme Court on July 11 decided in two appeals from the Crawford County District Court—E. M. Bird against the Young Coal Co. and Felix Corvi against the Crowe Coal Co. —that district judges have the right to review awards in compensation cases. The Supreme Court held that the District Court may review an award and make changes in either the amount or duration of time over which compensation payments are to be made. These cases were appealed to test the principle involved and the decisions affect a large number of claims for compensation for injuries suffered by mine employees.

## KENTUCKY

A delayed shot at the Wilson Mines, Bon Harbour, near Owensboro, on July 9, resulted in the death of Mayfield House, 20 years of age, a shotfirer, who was found with his head blown off.

The Munro-Warrior Coal Co., with headquarters at Birmingham, Ala., and operating extensively in both the Alabama and Kentucky fields, is planning major improvements and betterments at its mines at Nortonville, the extent and character of the work not having been announced as yet. The Kentucky mines of the company are reported to be operating on a better basis in recent weeks, the larger part of the output being shipped into Illinois and Indiana territory, the demand for all grades of both steam and domestic having shown material improvement of late.

Failure of the First State Bank at Elkhorn City, Pike County, which recently closed its doors voluntarily, is said to have been caused by slow business in the coal fields and frozen assets.

The mining towns of Haymond, Hemphill and Neon were reported flooded by raging waters in mountain streams on July 13, as a result of cloudbursts in the hills.

## MISSOURI

Governor Baker has appointed members of the State Board of Geology and Mines as follows: Elias S. Gatch and Phillip N. Moore, St. Louis; C. T. Orr, Webb City, and Edward M. Shepard, Springfield. Their terms expire on May 22, 1929. The appointments are subject to confirmation by the State Senate at its next session in 1927.

**Mine No. 1 of the West Kentucky Coal Co.**

This operation, located near Madisonville, Ky., is one of the St. Bernard group, which has a daily capacity of 15,000 tons. This group was acquired by the present owners in May, 1924.

O. A. Quisenberry, has struck a good bed of coal in the mine he is sinking on his farm just west of Vandalia, on Highway No. 22. At first the miners struck what is generally termed a valley in the vein and it was extremely difficult to cut through this, but in leaving the main entrance the coal struck was as fine a bed as has ever been found in this locality. This valley will be of some value to them in driving their entrance as it will form a splendid base at the bottom of the shaft.

## MONTANA

Edward Davies has been appointed state coal mine inspector by the Industrial Accident Commission to take the place of George N. Griffin, of Roundup, resigned. Mr. Davies also is a resident of Roundup. Griffin has held the position six years but because of failing health and eyesight was forced to resign. Davies, who was endorsed for the position by the state Federation of Labor at its meeting at Missoula, is 41 years old, was born in Pennsylvania, and his mining experiences cover six states and fields in England. After spending years in quartz mining he began mining coal 13 years ago.

## NEW YORK

For the three months ended June 30, Burns Bros., New York City, report a net income of $416,855, against $319,968 in the corresponding period last year.

The Delaware, Lackawanna & Western R.R. has filed plans for the erection of a 40,000-ton concrete trestle at its crossing of Delaware Avenue, in the northern part of Buffalo, to be used for the retail coal trade. It already has half a dozen such trestles about the city.

Following the closing of the Buffalo office of the Maher Collieries Co., of Cleveland, consequent on a merger of companies there, O. E. Southard, who opened the branch office, has formed a copartnership with Ralph K. Ford, coal operator of Columbus, Ohio, and an office has been opened at 182 Main Street, under the name of the Buffalo-Ford Coal Co.

Dr. T. H. Agnew, coal dealer, of Medina, has taken as Buffalo resident partner William J. Smith, late of the Maher Collieries office, and an office has been opened by the firm at 522 Marine Trust Building, under the name of the Agnew-Smith Fuel Co. Dr. Agnew will continue his residence and coal business in Medina.

## OHIO

A heavy rain on July 16 flooded the Provident mine of the Clarkson Coal Co. at St. Clairsville. Several hundred men were made idle. In addition to water pouring into the shaft, the boiler house was flooded, causing a cylinder head in the hoisting engine to blow out.

H. C. Cain, Columbus purchasing agent, has awarded the contract for 21,000 tons of Pomeroy nut, pea and slack for the municipal light plant, garbage disposal plant and other departments to the W. S. Harman Coal Co., of Columbus, at $1.14 per ton, f.o.b. mines. The freight is $1.26 per ton. The coal is to be shipped from the Co-operative Coal Co.'s Hobson and Blackstone mines, near Pomeroy. Bids for 8,700 tons for the Municipal Water Works department were rejected and will be readvertised.

Workmen are dismantling the tipple and machinery at the Gosline mine, near New Lexington, owned by Gosline & Co., Toledo. The owners say the machinery is too valuable to remain idle.

Suit was entered for an ancillary receiver for the Marmet Coal Co., of Cincinnati and Raymond City, W. Va., before Judge Smith Hickenlooper in the U. S. Court for the southern district of Ohio on July 14 by the Fourth and Central Trust Co., of Cincinnati, as trustee for the holders of $1,250,000 of bonds of the coal company. Main proceedings for the foreclosure of the mortgage were filed in U. S. District Court for West Virginia, after the coal company failed to meet its interest obligations and defaulted in the payment of 10c. a ton on coal produced, which was to go into a sinking fund for the payment of the bonds. That Court appointed V. L. Black, G. W. Williams and E. L. Waddell as receivers of the property of the company in West Virginia.

In his order Judge Hickenlooper assumed ancillary jurisdiction and ratified the order of the West Virginia federal court, granting the bank's petition and naming Messrs. Black, Williams and Waddell as receivers in this jurisdiction.

Two large coal companies in the New Philadelphia field will soon resume operations after an idleness of some time. The Midvale-Goshen Coal Co., of Cleveland, is cleaning up two mines and will start operations soon, employing 200 men. The Underhill Coal Co., of Cleveland, also will open three mines soon, after an idleness of about fourteen months.

In closing up the affairs of the Burton-Townsend Co., of Zanesville, one of the subsidiaries of the R. L. Dollings Co., Romert M. Pfeiffer, a Columbus attorney, bought in the assets at receiver's sale for $200 000. He has sold the two operating brick plants to the Zanesville Clay Products Co. and three sand and gravel plants to the Ayers Mineral Co., of Zanesville. He is now trying to dispose of four small coal mines in the Crooksville field in order to close up the affairs of the company.

David Watkins, president of Sub-District No. 6 of the United Mine Workers, addressed a large gathering of miners at New Lexington, recently, calling upon the men to "stand pat" for the Jacksonville scale. Union representatives will be sent to all mines in this section operating under the 1917 scale and use peaceful means to induce the men to cease work.

## PENNSYLVANIA

The Consolidation Coal Co. resumed operations Monday, July 20, at Mines No. 104 and 106, in the Meyersdale field. These mines have been down since April 1. The company has found a market for 16 to 17 cars a day, which will keep the mines working part time each week.

William M. Henderson, president of the Henderson Coal Co.; Albert R. Budd, of the Hillman and Diamond companies, and Floyd B. Lockhart, general sales manager of the Hillman Coal & Coke Co., all well known in Pittsburgh, recently, had Jerome G. Farquhar, treasurer of the Plymouth Oil Co., a Delaware concern, arrested on charges of false pretense and issuing false statements in connection with the promotion of the Plymouth Oil Co. The plaintiffs are minority stockholders. The fraud concerns the alleged issuance of 1,000,000 shares of stock instead of 350,000 shares. An equity suit was also filed in Delaware against officials connected with the Benedum & Trees interests, well-known oil operators, who control the Plymouth company, the stock, which was originally issued at $1.50 a share, rose as high as $37 a share. The plaintiffs declare that as a result of issuance of more stock the value of their stock has dropped to $10, while the defendants claim the market value of the stock is $28 a share. All the parties in the suit got their stock at the "inside" price.

The weekly report of the Pittsburgh Coal Producers' Association, released July 16, covering statistics of the previous week, shows that of a weekly capacity of 629,880 tons, the total production of the district was 42,607 tons, or 6.8 per cent. These reports cover practically all the large commercial interests of the Pittsburgh district, including the Pittsburgh Coal Co. The percentage of operations compares with 8.3 per cent for the week ended July 4 and 31.6 per cent for the week ended July 12, 1924. Sixty-seven out of 80 reporting mines are idle. The production was divided as follows: Rail, 34,259 tons; river, 6,918; used 1,430.

What is said to be the largest cargo of anthracite ever put aboard ship for transportation by sea was shipped this week by the Philadelphia & Reading Coal & Iron Co. The cargo consisted of 6,500 tons, compared with normal cargoes of 1,500 to 1,600 tons. It was loaded on the steamboat Bristol at Port Richmond, Philadelphia, July 21, consigned to Providence, R. I.

Four miners were seriously burned in a gas explosion at the Truesdale colliery of the Glen Alden Coal Co., at Nanticoke, July 15. The cause of the blast is not certain, but the finding of a partly burned match at the scene of the explosion leads to the suspicion that one of the men was smoking, in violation of the mine laws. The men were wearing electric lamps.

The Jefferson & Indiana Coal Co. has opened an additional mine at Tide, where the company is producing 400 tons daily. Another at Coal Run has been opened. This company is now mining 7,000 tons daily in the various mines leased from the Rochester & Pittsburgh Coal & Iron Co. and, operating on the 1917 basis, expects soon to be mining 10,000 tons daily.

The new $2,000,000 coal breaker under construction at Lansford for the Lehigh Coal & Navigation Co. will be able to handle the coal taken from three different collieries.

Changes affecting the Woodward, Bliss and Storrs mines of the Glen Alden Coal Co. were announced last week. Joseph A. Reynolds, who for some time worked as superintendent at the Woodward colliery, in Edwardsville, and who was relieved for a vacation, is now superintendent of the Storrs colliery. G. P. Troutman, superintendent of the Bliss mine in the Nanticoke region, has succeeded Mr. Reynolds as Woodward superintendent. The superintendency of the Bliss mine has been taken over by James Garvin, who was employed at the Storrs colliery for some time.

Secretary of Labor and Industry Richard H. Lansburgh has appointed Melvin G. Lehman, of York, chief adjuster of the Bureau of Workmen's Compensation, as assistant director of that bureau. Lehman will continue his duties as adjuster and will act as the general assistant of William H. Horner, director of the bureau, having charge of the bureau in his absence. The appointment is in keeping with the recent appointment of a deputy to the Secretary. There has never been anyone authorized to act in the absence of either the Secretary or the bureau chief.

**A Trip Emerging from Nisbet Mine**

This mine—No. 11—located near Earlington, Ky., is one of the St. Bernard group of the West Kentucky Coal Co.'s holdings.

## TENNESSEE

L. T. Dee, of the Superior-Rock Springs Coal Co., with headquarters in Ogden, has been named as one of the forty directors of the National Coal Association. He will represent Utah and Wyoming on the Board and is the first Ogden man to receive such a distinction. The election took place at the recent Chicago meeting.

The Liberty Coal Mining Co., Commercial Bank Bldg., Memphis, of which Fred M. McDonald, Sr. is president, has increased its capital from $100,000 to $250,000.

## UTAH

Two more Utah coal leases were announced early in July by the Secretary of the Interior. One of them comprises 1,800 acres in Book Cliffs region, about eleven miles south of Sunnyside. The government royalty is 12½c. a ton for coal mined and there must be a minimum investment of $75,000 during the first three years with a minimum production of 50,000 tons a year beginning with the fourth year of the lease. The other tract includes 800 acres in Pleasant Valley, Wasatch Plateau, about three miles west of Clear Creek. The royalty is on a basis of 10c. for each ton of coal mined, and the minimum investment must be $90,000 during the first three years with a minimum production of 50,000 tons a year beginning with the fourth year of the lease. The sale of these leases will be made in Salt Lake City in the near future.

### WASHINGTON

The Bellingham Coal Co. has obtained control of the Tiger Mountain Mine, 4½ miles south of Issaquah, and is preparing to open up the property at once. It is reported that eight veins of a superior grade of coal from 5 to 10 ft. thick are indicated on the property. Lawrence and George Campbell, of Issaquah, have taken a contract to drive a 90 ft. rock tunnel on which they have started work. This tunnel should cut a 10 ft. bed at a point to provide a 400-ft. lift. By the last of August the company expects to be in a position to produce 500 tons of coal a day.

### WEST VIRGINIA

E. L. Douglass, receiver for Jewett, Bigelow & Brooks, by order of the U. S. District Court of West Virginia, has been empowered to turn back to the owners of the land the properties of the Seminole Gas Coal Co., no bids for the properties having been received. The J. B. B. Co. expended about $365,000 on this plant at Gypsy, and it produced about 18,000 tons of coal a month. The same process will be followed with the property of the Guyon Mining Co., at Manbar, which produced about 22,000 tons per month. Steps have been taken in the United States courts to turn this property back to Miss Irene Hichman, owner of the land.

Howard W. Showalter, president of the Continental Coal Co., announces that the Monongahela and B. & O. Railroads have agreed to recognize Sands mine of the company, at Rivesville, as a joint mine.

An involuntary petition of bankruptcy was filed on July 6 in the U. S. court for the Southern District of West Virginia against the Synn Glen Fuel Co., of Newlyn, Fayette County, on the application of the Charleston Hardware Co. The creditor claims that the coal company owes in excess of $1,000 and that it committed an act of bankruptcy in executing a deed of trust last February to C. B. Floers, trustee for the Banks-Miller Supply Co., of Huntington, to secure a claim of $6,103.41.

Fire was discovered in the Osage Mine of the Brady-Warner Coal Corporation, at Osage, July 10, soon after the day shift had left the mine. The fire, according to officials, is burning in an abandoned section of the mine. R. M. Lambie, head of the state Department of Mines, was notified of the fire and District Mine Inspector William Moore arrived at the mine soon after the fire was discovered and began the work of extinguishing the flames. Mine rescue crews from both the Preston and Marion divisions of the Bethlehem Mines Corporation were sent to fight the fire. They were under the direction of Robert Reid, safety engineer of the Bethlehem corporation. Inspector Moore reported the fire under complete control July 11.

State mining inspectors say that the mine fire at the plant of the Eureka mine of the Bertha-Consumers Co., near Morgantown, has been extinguished, but that it will require 30 days to clean it up. The main fire started March 16.

A judgment of $900 was awarded Shannon Bros. against the mines owned by Henry Ford at Twin Branch, in McDowell County, in the federal court at Bluefield. The plaintiffs sued on an alleged breach of contract for the sum of $3,800.

### CANADA

Foreign coal continues to arrive in Montreal in large quantities. In the past few days the steamer Baron Elinbank, from Glasgow, discharged 2,435 tons there. Other colliers to reach the port with cargoes are the Glencorrie, Glendochart, Keybar and Maple Hill. At Levis, Chicoutimi and Port Alfred a number of steamers are discharging cargoes of United States coal.

Eighty men employed by the Marcus mine, in the Edmonton district, Alberta, who had been out on strike on a wage disagreement since midnight on June 30, returned to work July 8. The men will work at the old scale until such time as the Edmonton quota for the Ontario coal shipment is mined and loaded. The other strikers decided to await the arrival of Fair Wage Officer Harrison, who was expected to try to bring about an agreement between operators and miners.

## Traffic

### I. C. C. Again Defers Cut in Rates from Kentucky

Suspension of the revised tariff on coal from eastern Kentucky and West Virginia mines to Mississippi River points and beyond has been extended until after a hearing is conducted by the Interstate Commerce Commission.

Illinois coal operators opposed the revision, which would have allowed the Kentucky and West Virginia operators a reduction of 15c. a ton on coal to Iowa territory and certain Mississippi River points.

The reduction had been allowed by the Louisville & Nashville R.R., the Chesapeake & Ohio R.R. and the Norfolk & Western Ry. last March, but was never put into effect, the Interstate Commerce Commission suspending the revision until a hearing could be conducted.

The hearing was to have been held in Chicago July 8, but none of the parties interested was ready for trial and the hearing was postponed. As the time for expiration of the suspension was near at hand, the suspension was extended. The Illinois operators contend that the proposed rates would discriminate against them. They assert that they are already working under rate and wage handicaps as compared with the inner crescent pits in the East.

### Southwest Coal Men Ask Refund Following Rate Cut

At the conclusion of a hearing in Kansas City, Mo., July 15, attorneys for about four hundred coal dealers in Kansas and Nebraska who are demanding a refund on freight rates from railroads carrying Colorado coal into their districts, and attorneys for the railroads fighting the refund demand, were instructed by Alfred S. Knowlton, examiner for the Interstate Commerce Commission, to file briefs with the commission not later than Sept. 1. The dealers base their claim on a recent decision of the Commission reducing freight rates from the Colorado field into Kansas and Nebraska. They ask a refund of the difference between the old and new rates on coal shipped them in the last two years. Those in the western part of the two states, where the reduction was greatest, were most interested in presenting their case before the commission examiner.

### Orders Cut in Hard Coal Rates To Staten Island

Rates on anthracite from the Pennsylvania mines to Staten Island, N. Y., were declared unreasonable and unduly prejudicial on July 15 by the Interstate Commerce Commission, which ordered the railroads to establish rates not more than 13c. above the rates now applying to Bayonne, Jersey City and other points in northern New Jersey taking the same rate. A differential of only 10c. above the northern New Jersey rate is allowed to certain points via the Pennsylvania R.R. The change is to be effective Sept. 1. At present the rates to Staten Island are in some instances 70c. per ton higher than those to northern New Jersey.

### Sanction New Rates in New York

The Public Service Commission of New York has approved a new freight schedule of the Lehigh Valley R.R. on bituminous coal and coke, including coke breeze, dust and screenings, carloads, from Buffalo, East Buffalo and Harriet to various stations on its lines and on lines of other carriers; changes effect reductions; effective July 30, 1925.

A new regulation of the Delaware, Lackawanna & Western R.R. filed with the Public Service Commission provides for switching absorption of 38c. per ton (net or gross, as rated) at Corning, N. Y., on coal and coke, carloads, switched by the New York Central.

## Industrial Notes

**P. S. Gardner,** American Rheolaveur Corporation, with Andrews Allen, of Allen & Garcia, left July 15, on the S.S. Mauretania for Europe, where visits will be made to plants in Belgium, France, England and Germany. The purpose is to see some of the 150 Rheolaveur washeries located in Europe, the total capacity of which is 40,000,000 tons annually.

**The Worrell Mine Tie Manufacturing Co.** has been organized with a capital stock of $50,000 and expects to begin operations before Aug. 1. This company will manufacture steel mine ties and also do general electrical work. The officers of the company are J. Hugh Miller, president; J. G. Durant, vice-president; R. H. Worrell, manager; J. C. Durant, Jr., secretary-treasurer. R. H. Worrell, the manager, formerly was with the E. E. White Coal Co. at Stotesbury, as chief mechanic for a number of years.

**A. T. Shurick** leaves for London Aug. 1 to study the Thornley briquetting binders, manufactured by the Thornley Binders, Ltd., 37-41 Gracechurch St., London, England. The plant of the British company is at Stromness, in the Orkney Islands.

**Arlington Bensel,** formerly vice-president and general sales manager of the Driver-Harrison Co., has announced his connection with the **"Hybnickel" Alloy Products Co.,** as exclusive sales agent, with offices at 300 Madison Ave., New York City.

**The Morrow Mfg. Co.,** Wellston, Ohio, announces the opening of a branch sales office at 1018 Fulton Building, Pittsburgh, Pa., in charge of V. T. Barkley, who has been associated with the coal-mining industry for the past fourteen years. Mr. Barkley will be glad to confer on and plan coal-handling problems.

## Association Activities

The third quarterly meeting of the Pittsburgh Coal Mining Institute was held July 11 in the Chamber of Commerce, Pittsburgh. H. N. Eavenson, mining engineer, delivered the principal address at the afternoon meeting. S. C. Reynolds, safety inspector, handled the question-box discussions. S. A. Taylor delivered the chief address at the evening session, when C. P. Byrne, state mine inspector, handled the question box. A good attendance was noted.

## Coming Meetings

**Rocky Mountain Coal Mining Institute.** Summer meeting, Aug. 26-29 at Price, Utah. Secretary, Benedict Shubart, Denver, Colo.

**American Institute of Mining and Metallurgical Engineers.** 132d meeting, at Salt Lake City, Utah, Aug. 31 to Sept. 3. Secretary, F. F. Sharpless, 29 West 39th St., New York City.

**Oklahoma Coal Operators' Association.** Annual meeting, Sept. 10 at McAlester, Okla. Secretary, A. C. Casey, McAlester, Okla.

**New York State Coal Merchants' Association.** Annual convention, Sept. 10-15, at Richfield Springs, N. Y. Executive Secretary, G. W. F. Woodside, Arkay Bldg., Albany, N. Y.

**National Safety Council.** Annual meeting Sept. 28 to Oct. 2, at Cleveland, Ohio. Managing Director, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

**Tenth Exposition of Chemical Industries,** Sept. 28 to Oct. 3, at Grand Central Palace, New York City.

**Canadian Institute of Mining and Metallurgy.** Annual western meeting Nov. 3-5, Winnipeg, Manitoba, Can. Secretary, George C. Mackenzie, Drummond Bldg., Montreal, Que., Can.

**Fourth National Exposition of Power and Mechanical Engineering,** Nov. 30 to Dec. 5, at Grand Central Palace, New York City.

**Coal Mining Institute of America.** Annual meeting, Dec. 9-11, Pittsburgh, Pa. Secretary, H. D. Mason, Jr., P. O. Box 604, Ebensburg, Pa.

# New Equipment

## New Shovel Is Largest Mounted on Tractors

The new Marion Model 125 shovel, with its all-steel boom, firebrick arch, high-pressure boiler, heavy gantry frame, extra large roller circle and improved hoisting unit with pressure oiling, is said to be the largest and heaviest excavator that has ever been mounted on crawling traction trucks. A number are now in coal stripping use.

This new shovel is full revolving, has large dipper capacity, and is designed throughout for the hardest work and toughest digging. The design and construction are such that the main upper frame, which carries all the machinery, including the boiler, piping and cap, can be shipped as a unit on railroad trucks. Because of this, a minimum amount of erection is necessary in the field.

The machine is mounted by three-point suspension on four crawling traction trucks and equalizing is accomplished by means of a pivoted, cast alloy-steel axle. In traveling over uneven ground the front trucks with their axle are free to adjust themselves in a vertical plane without a tendency to create stresses or strains in the frame, or cause a steering movement.

The lower frame is constructed of 30 in. I-beams which, at present, are the deepest manufactured. The top of the frame is covered with heavy 1-in. gusset plates. The lower circle is made of 80-lb. rails and is 16 ft. in diameter.

Propulsion is entirely through gears to all four of the crawler trucks. Any one of the trucks can be disconnected by a clutch. This makes steering easy and permits a small turning radius.

The boiler is a locomotive type with a fire brick arch as standard equipment. This arch is not only a fuel economizer but it also eliminates tube troubles by preventing cold air from reaching the tubes while firing.

Hoist, swing and crawl main bearings are equipped with a lubrication system similar in design to that of an automobile engine and consisting of a motor-driven oil-circulating pump, sump tank, conductor and drainage piping. The makers believe this is the first power shovel to be equipped with a pressure oiling system.

## Strong Briquet Binder Will Harden with Age

A new binder for briquets that shows unusual cohesion will soon be introduced in this country from England, where the process has been in course of development for the past three years, a commercial plant involving an expenditure of something over $500,000 being put in operation during the fall of last year.

At the plant of the Rose Patent Fuel Co., in Great Britain, large briquets, weighing 12 and 24 lb., such as are manufactured quite commonly in Great Britain were dropped from a height of 36 and 40 ft. onto railroad iron, and were fractured only at the point of impact, whereas the same test applied to coal-tar briquets resulted in their breaking up into small bits.

Another distinctive feature of this new binder is that it has the remarkable characteristic of hardening with age, much the same as cement. Thus, instead of disintegrating when not used at once, the briquets continue to harden for an indeterminate period.

The manufacturing process with this binder is exactly the same as with coal-tar pitch, except that less power is required for the grinding, and the plugging. The admixture of the binder with the fines is readily made at tempera-

**Large-Type Crawler Shovel on the Job in a Coal Pit**

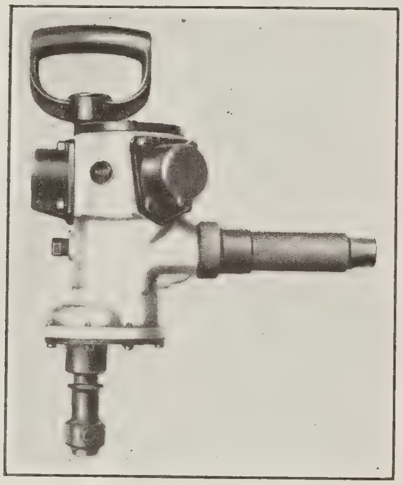
This new shovel is built for hard work in places which it can reach on its own tractors. Heavy construction throughout and the incorporation of a number of advanced ideas in shovel design are counted on to make this excavator popular in coal mining.

tures of 70 to 80 deg., as compared with 110 to 120 deg., as required with coal-tar pitch.

A series of exhaustive steaming tests made at the New River Yard of the Metropolitan Water Board, in London, England, show that these briquets have an appreciably higher calorific value than those formerly used, which were manufactured from coal-tar pitch. Under conditions of forced draft, in the furnace, the briquets "cauliflower" uniformly, thus favoring combustion; there is no tendency to soften, break down or disintegrate while burning. A. T. Shurick, Athens, Ohio, will introduce the new binder into this country.

## Wood-Boring Air Drill Has Renewable Cylinders

A new-size, light-weight, reversible, pneumatic wood-boring machine, brought out by the Ingersoll-Rand Co., has cylinders which are renewable and interchangeable. This is a valuable feature, as any cylinder after long service, easily may be replaced and the motor made as good as new at slight cost. This new drill is known as size DD and is suitable for wood boring up to 1-in. diameter holes. The construction of this machine is similar to cylinder drills which this company manufactures.



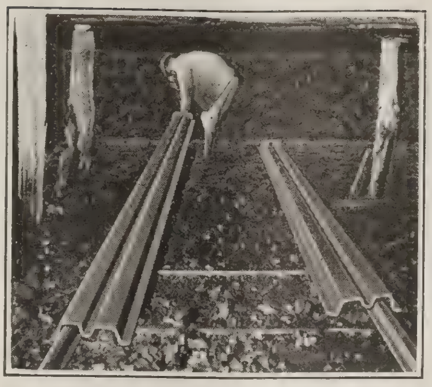
**Three-Cylinder Boring Machine**

This light-weight air drill weighs only 15 lb. It is specially suited for boring wood. A 1-in. drill may be used with it.

The main features of this type machine, in addition to the special cylinders are, briefly: special three-cylinder motor; light-weight aluminum case, with steel bushings cast in position in all the bearing holes and the throttle hole and renewable crankpin sleeve.

The three-cylinder motor has its rotating parts all accurately balanced, eliminating vibration and reducing wear and tear on the machine. The drill is economical in cost of maintenance, is high powered, and, moreover, every part is readily accessible for inspection.

These drills are furnished with a spade handle and bit chuck. A breast plate or feed screw can be substituted in place of the grip handle when so desired and a drill chuck in place of the bit chuck. Thus the drill can be adapted to a wide variety of work.



**Tompkins Extension Rails**

These devices, especially helpful in mines using loading machines, were patented by Harold P. Tompkins of Charleston, W. Va. The ease with which each rail can be moved into place after each length of track is laid, can be appreciated from this illustration showing a man sliding a rail into position. The bail acts as a car stop when it is laid back over the end of the rail. Tompkins extension rails are distributed by the Midland Steel Products Co., of Cleveland, Ohio, and the Banks-Miller Supply Co., of Huntington, W. Va.

## Obituary

**Thomas D. Cassidy**, 69 years of age, coal operator of Lexington, Ky., president of the Cassidy Coal Co. and vice-president of the Elkhorn Coal Co., recently died in that city after a long illness. He was a native of Flemingsburg, Ky., going to Lexington thirty years ago. A son, Tilford J. Cassidy, and his wife, survive.

**Hugh Bone**, first secretary-treasurer of District 14, United Mine Workers, died July 13 at the home of a daughter in Kansas City. He was 76 years old at the time of his death. He served in the Kansas House of Representatives during the Populist era. A native of Scotland, Mr. Bone came to Kansas in 1885 and was active in organizing the district union of the miners in 1892. He left the Kansas district for Kansas City five years ago.

## Publications Received

**Surface Machinery and Methods for Oil-Well Pumping**, by H. C. George, Bureau of Mines, Washington, D. C. Bulletin 224. Pp. 148; 6 x 9 in.; illustrated.

**Bituminous Coal as Generator Fuel for Large Water-Gas Sets with Waste-Heat Boilers**, by Wm. A. Dunkley, Bureau of Mines, Washington, D. C. Technical Paper 335. Pp. 43; 6 x 9 in.; illustrated. Summarizes tests made of bituminous coal in water-gas sets, shows the practical efficiencies obtained and discusses phases of the process.

**Electrical-Machinery Erection**, by Terrell Croft. McGraw-Hill Book Co., 370 Seventh Ave., New York City. Price, $3. Pp. 306; 5½ x 8 in.; illustrated. Describes the methods and processes used in modern practice in the mechanical installation of electrical machinery.

**Personal Leadership in Industry**, by David R. Craig and W. W. Charters. McGraw-Hill Book Co., 370 Seventh Ave., New York City. Price, $2.50. Pp. 245; 5½ x 8 in. Gives complete and practical treatment of what the manager of men faces in getting work done.

**Structure of Herrin (No. 6) Coal Seam Near Duquoin**, by D. J. Fisher. Department of Registration and Education, Division of the State Geological Survey, Urbana, Ill. Report of Investigations—No. 5. Pp. 34; 6x9 in.; illustrated. Describes the results of a geologic study of the Herrin (No. 6) coal seam, including the lay or amount of dip of the coal bed and the faults, splits and other features which interrupt its continuity. The physical characteristics and modes of origin of the coal and its inclosing beds also are briefly treated.

**Third Annual Report of the State Board of Registration for Engineers of West Virginia for Year Ending June 30, 1924.** Pp. 59; 6x9 in.

## New Companies

M. A. Pishner, Carrie Pishner and Joseph Nugnola, of Pittsburgh, Pa., contemplate the incorporation of a new coal company to be known as the **Pishner Fuel Co.** The new company plans to operate a mine. It is expected that a Pennsylvania state charter will be granted within a few weeks.

**The Federal Coal Mining Co.** was incorporated in Henryetta, Okla., early in June, with a capital stock of $15,000, by Patrick J. O'Hara, John P. Johnson and others.

**The Warren Coal Co.** was incorporated in Birmingham, Ala., late in June by H. A. Warren, David McCarty and others.

Papers have been filed chartering the **Byesville Coal Co.**, Byesville, Ohio, with an authorized capital of $12,500 to mine and deal in coal. Incorporators are Fred H. Peters, Alex Ramage, Mike Novotny, H. P. Muhlbach and William Grandy.

## Trade Literature

**Static Condensers for Power Factor Correction.** Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa. Circular 1670-Ed. 2. Pp. 20; 8½x11 in.; illustrated. Effects of low power factor, power factor correction, selection of corrective device, theory of static condensers, chart to determine kva. required, table of sizes are some of the contents of this bulletin.

**Ash and Soot Disposal at Milwaukee Sewerage Plant.** Conveyors Corporation of America. Chicago, Ill. Pp. 16; 8¼x10¾ in.; illustrated. Tells how the ashes and soot are handled by conveyors from the stokers, combustion chambers, economizers and chimney.

**Mesta Automatic Plate Valves.** Mesta Machine Co., Pittsburgh, Pa. Bulletin D. Pp. 16; 7½x10½ in.; illustrated. Describes the use of these valves (Iversen patents) on all types of compressors. Charts giving temperatures of air delivered by compressors and blowing engines and showing curve for flow of gases through orifices and nozzles are included.

The Falk Corp., Milwaukee, Wis., recently issued bulletin No. 38, 47 pp.; 8¼x 10¾ in., illustrated, on its **Herringbone Gear Speed Reducers.**

**Model "D" Megohmer.** Herman H. Sticht & Co., 15 Park Row, New York City. Bulletin No. 130. Pp. 7; 6x9 in.; illustrated. Besides describing this instrument, instructions for its use are given.

**Standardized Substations.** Delta-Star Electric Co., Chicago, Ill. Bulletin No. 12. Describes new line of standardized steel tower outdoor substations intended for installation by utilities serving customers buying power from high-tension distribution lines.

**Maag Gears.** Niles-Bement-Pond Co., New York City. Pp. 19; 9 x 11 in.; illustrated. Circular No. 265-1. Describes the advantages and construction of these gears.

**Modern Practice in Mining**, by Sir R. A. S. Redmayne. Longmans, Green & Co., 55 Fifth Ave., New York City. Third Edition. Vols. I and II. Price, $3.75 each. Vol. I covers the occurrence of coal, value and method of boring. It has 231 pp.; illustrated. Vol. II is on sinking of shafts. It has 273 pp.; illustrated. Both books are 6 x 9 in.

**Our World Trade in 1924.** Foreign Commerce Department, Chamber of Commerce of the United States, Washington, D. C. Seventeenth quarterly issue. Pp. 31; 6 x 9 in. Gives the value and volume of principal exports and imports between the United States and chief foreign markets.

**Microscopical Structure of Anthracite**, by Homer G. Turner, assistant professor of geology, Lehigh University, Bethlehem, Pa. Circular No. 2. Reprinted from the Transactions of the American Institute of Mining and Metallurgical Engineers. Pp. 21; 6 x 9 in.; illustrated.

**Grinding, Pulverizing and Separating Machinery.** Raymond Brothers Impact Pulverizer Co., Chicago, Ill. Catalog No. 17. Pp. 50; 8 x 11 in.; illustrated. Describes the difficulties of grinding and their solution. Plant layouts are shown covering proper arrangement for various materials.

## Those Terrible Mines?

EVERY ONCE in a while comes the plaint of the miner against the unfortunate conditions under which he works. He really does not wish to labor in the open with the carpenter and mason, but he does want extra pay for toiling underground. It is true, mining work is done in the dark and in the dirt, but it is not done under a wilting sun or in the frost. The carpenter and mason have much harder physical conditions than the miner. The plasterer, the grader and the trench digger and backfiller have just as dirty work and have to face the climatic variations also.

The miner is really fortunate. He has no hot and no cold days. True, he may have a wet place, and if the water falls from above he may have to put up sheet iron or wear slickers, but carpenters, masons, graders and trench diggers often work in the rain and when it gets beyond their endurance they quit work and lose pay for the days or part days they are idle. We all irk somewhat under the compulsions of industry, whatever we may be doing, and the miner is to be excused for his long-drawn sigh, but that is no reason why he should receive sympathy, instead of the congratulation to which he is entitled. He knows he has the better fate, for he almost never leaves the industry, and when he is asked to work outside he refuses or he accepts the new occupation with more complaints than he ever leveled at his accustomed job and with the intention of getting "below" again as soon as he can.

## Before or After Taking

CONTACT with the actual problems of mining before or after receiving collegiate training in engineering is necessary if a man would be a successful and competent mining engineer. The technically trained man must either start from the earth or come down to earth before he can be successful at supervision. It is true that the young man who has worked in the mines is sometimes so enamored of his job that he resents being sent to college "to cram" as he expresses it and that the man who goes to college first wants to sit behind the mahogany and issue orders as soon as he returns. But neither plan gives good results.

Not only technological training specific to the industry but information that can be attained only from personal contact with the actual work is necessary for the man who walks around and gives orders. It is just as well to make up one's mind to that. Even in Europe actual experience of this kind is customary. One would say that the "physical training" should be as long as the academic and the closer it is to the actual work the better, the more the atmosphere is absorbed and the closer are the observations that are made.

Six to eight years, half academic and half in actual field contact, is not too long a period in which to make a real start. A man thus trained should be occupying a really responsible position at the age of 30. Many a man by the old route without college training and with hard work gets to such a position in less time, but such advancements are usually made in small corporations, and the men that get them usually stay for the rest of their lives either just where they are or find employment with a company of no larger size.

## Less than One in a Thousand

GREAT BRITAIN REPORTS that the fatality rate per thousand in its coal mines is lowered to 0.98. Last year it was 1.06. In the same year the fatality rate in the United States was 2.87 per thousand employees or nearly three times as high as in Great Britain, and that in a year of relative depression. It must be remembered, however, that Great Britain also suffered from a depression and that the number of working hours in a day is only seven.

Perhaps it would be best to make a comparison per thousand 2,000-hr. workers. The British rate in 1924 we figure as 1.20, whereas our rate during 1923 was 3.63 or about three times as great. Many believe the British miner is exposed to more natural hazards than the American. That is always difficult of proof, but the figures given are disquieting, to say the least, and only by an investigation of the rate per million tons produced can any relieving consideration be found.

The fatality rate per million tons of coal mined in this country was 4.15, whereas in Great Britain it was 4.36, so the tonnage was obtained in the United States at a lower blood cost per ton. In the matter of ease of production America certainly has the advantage, so it can hardy be wondered that it has a lower rate per million tons mined. The marvel is that we have not been able to make the difference more considerable.

## If Coal Cutting Failed This Is the Reason

SAYS John L. Lewis, the president of the United Mine Workers, in his book "The Miners' Fight for American Standards," which should read for "Standards Higher than Those Normal to American Labor:" "Fifty years have passed into history [it should be only a little over half that length of time but let that pass] since the first undercutting coal machine designed to relieve the strength-sapping strain on the miner's body and [to attain] materially lowered production costs was introduced; yet coal mines continue to be opened, the owners of which have neither the capital nor intention to provide this essential machine."

In judging the conclusion that this is a "sin of management in the bituminous-coal industry" we will pass by the generally admitted fact that the mine workers opposed this great innovation and are still opposing it where it is not introduced, though it saves a "strength-sapping strain on the miner's body," and we will proceed to call attention to the fact that the miners through their unions repeatedly have attempted and almost everywhere succeeded in establishing a differential that makes the introduction of the machine a doubtful source of profit and the use of the better classes of cutters productive of only indirect gain. Machine coal in many instances is more economical than what is termed "hand-mined coal" (but rather should be called "powder-mined coal") only because it is not so badly shattered and because its production reduces the area to be developed and maintained and saves in the construction of houses.

In cases where the use to be made of the coal does not demand the production of large sizes the advantage of the machine is slight except in so far as it removes the danger of solid shooting. The union is responsible largely for this being a hazard. There is little evidence that "powder mining" is strength-sapping. Its chief disadvantage is its danger, and where the coal is soft and easily shot and precautions are taken, as in the Connellsville region, which, by the way, is non-union and uses proper methods of shooting, the statistics show that the dangers can be avoided. In union fields, where the union men insist in overloading their holes and in firing them or having them fired, and where face sprinkling is unknown, the hazard of "powder mining" is extreme.

This charge of Mr. Lewis falls to the ground. We rejoice to see machine mining develop, but only because of secondary, almost impalpable economies and because of safety and not because the mining by machine is *per se* any cheaper in most cases than "powder mining" or true "hand mining." In the cost of machine mining the cost of powder, repairs, interest and depreciation have, of course, to be considered and when they are the machine has only incidental advantages over hand mining. The union has seen to that. Yet Mr. Lewis uses the fact that the use of machines is only 67 per cent instead of 100 per cent as a club against the operator. Being with his back to the wall, we suppose he will be excused for using what weapons come to his hand to the best advantage, even though he cannot prove the right of ownership.

In the anthracite region the use of the mining machine has been made practically impossible by the action of the union. It has introduced into the contract made with the operators a provision that has caused the arbitrator in his belief no option but to give such a decision to the mine workers as makes the operation of mining machines unprofitable. Mr. Lewis has uncovered a mare's nest. His attack on coal operators calls renewed attention to the union's studied opposition to mine-operating efficiency.

## Waiting for Others

FROM COLONIAL times the farmer has waited for others to find a way for him. Fortunate, indeed, it is that the Department of Agriculture and the state agricultural colleges have developed fertilizers, insect poisons, new systems and plant varieties so that the farmer has been able to overcome the steady impoverishment of his soil, droughts and the attacks of plant plagues.

Coal men have followed a similar course to the farmers. They have left progress in the use of their product to chance. It is true that the early anthracite companies urged and assisted the consumer, or possible consumer, to make use of anthracite. In the early days the Delaware & Hudson Co. was quite active in inducing steamboat owners, householders and industries to use that fuel instead of wood. The anthracite companies are fostering the use of fine coal, but they have invented few or none of these devices. Eckley Coxe, it is true, made important efforts to put the automatic stoker in the steam field, but on the whole, coal men have left to the manufacturers the work of devising new stokers and ascertaining the best method of employing them.

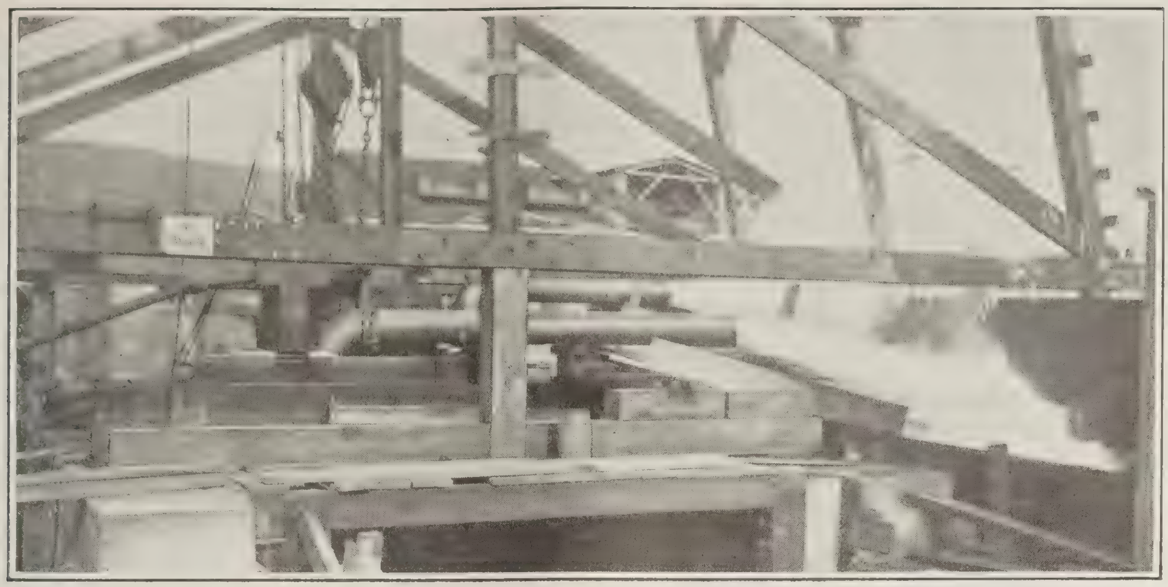
By and large, the coal men have done little. They wanted the consumer to provide his own expansion of the coal industry, and the development that made the small sizes saleable slowly came about, thanks to the consuming public, not to the operator.

In Great Britain the mine owners are contributing to research. They are trying to expand their narrowing market. As the British and Continental industries are more wasteful of fuel than ours, they have to face a greater restriction in the sale of coal than we have. Our operators probably already have encountered the worst of their troubles, but in Europe the long period that has passed without much advance in combustion methods will make conditions desperate when once the tide sets full for economy with our progress serving the economizers as a guide. In the United States almost the only studies being made are those of the National Coal Association and the Bureau of Mines. It is only a beginning but it is suggestive of a brighter future. It looks forward to the time when petroleum will be driven not only from the steam field but also from the internal combustion and lubricating fields. This is only a small part of the progress necessary. Coal should have a leading place in our organic chemistry field and that industry should be immensely more important than it is now.

The electrical industry is taking time by the forelock with its Society of Electrical Development which is finding further uses for electricity. Fortunately the problems of the public utility companies are small compared with ours, for theirs is largely an attempt to hurry the inevitable change in the habits of mankind, whereas the coal industry is seeking to find new devices for the conversion of one chemical substance into another. Probably the coal industry would do well to try also the method of that electrical society, inducing the public to use more heat, to refrigerate their houses, offices and public buildings, to cease burning wood and to use small, instead of large, coal, paying a better price for the small sizes. The Copper and Brass Research Association and the American Zinc Institute are promoting the use of copper and of zinc respectively. The brick manufacturers are associated in an endeavor to popularize brick. Coal men have a lot of good exemplars to follow and they should get in touch with them and learn their ways and, where possible, co-operate with them, especially the Society of Electrical Development, in the promotion of the refrigeration plan.

The natural means for doing this work as far as the bituminous field is concerned is the National Coal Association. It can be the bituminous coal men's Coal Research Institute and its Society of Coal Development.

Why wait for others? Let us find a place for our coal and instead of the present ruinous competition we can find employment for all. But let us be practical, tackling the easiest roads to increased demand most energetically and leaving the larger and less obvious problems for secondary consideration.



# Air-Lift Pumping System Quickly Raises Water From Flooded Anthracite Mine Areas

## Ordinary Dewatering Methods Could Not Easily Be Used at First — Now Air Lifts Water Part Way Up Shaft and Centrifugal Units Pump to Surface

By E. J. Gealy
Associate Editor, *Coal Age*,
New York City

UNUSUAL METHODS are being employed to reopen the Neilson mine of the Shamokin Coal Co. in the city of Shamokin, Pa. For many years the property had been idle and the water had risen in the shaft to within about 30 ft. of the ground level. All of those parts of the coal beds which had been previously mined were, therefore, full of water and it was necessary to start any unwatering operations from the outside.

The officials of the company decided that the best way to start unwatering the mine was by means of an air-lift pumping system. Probably the fact that the mine will need air-compressing equipment when it gets into operation had much to do with selecting this method of raising the water. Nevertheless, something different from ordinary mine-pumping machinery had to be used so as to obviate the necessity and expense of providing preliminary structures for pumps and buckets.

On Nov. 9, 1924, one air lift was started. It consisted of a 190-ft. column line of 10-in. wrought iron pipe supported in the old mine shaft. This length of pipe was considered sufficiently long to obtain satisfactory submergence, although the shaft was 1,200 ft. deep and the vertical depth of the water was greater than this because of the basins in the steeply pitching beds.

The air supply for the lift was furnished by a compressor located in a large building a few feet from the shaft. In December another similar air lift was installed in the shaft and the two lifts were kept in operation as much of the time as possible. The air lifts were stopped only when it became necessary to add extra lengths of pipes to maintain sufficient submergence to obtain satisfactory results.

In the air-compressor house two large compressors driven by 2,300-volt synchronous motors supplied the air. One compressor was a 1,500-cu.ft. per minute unit driven by a 300-hp. motor and the other a 3,500-cu.ft. per minute machine connected to a 600-hp. motor. Both machines were directly connected to their respective drives.

The cooling water for the compressors was circulated to a tank located on a hillside a short distance from the compressor house where it was cooled by being discharged upon a screen mounted a few feet above the top of the tank. The water dropped through the perforations in the screen and separated into fine streams which permitted the particles to cool and then drop into the tank and be conducted back to the water jackets on the compressors.

Passing from the compressors, the air was conducted through an 8-in. wrought iron pipe. Near the top of the shaft this pipe was connected to two 4-in. pipes which supplied the air to each lift. Suitable control valves were placed in the air lines so that the quantity of air could be regulated or stopped whenever it was necessary.

Several novel features were incorporated in the design and operation of the lifts by B. C. Osler, superintendent of the mine. The foot piece was constructed

---

The view in the headpiece shows the two air lifts in operation. At first the water was within 30 ft. of the ground level. By means of these lifts the water was lowered to a point 505 ft. below the surface of the ground. Now air lifts raise the water to the No. 12 level and it is relayed to the surface by two 1,000-gal. per minute centrifugal pumps.

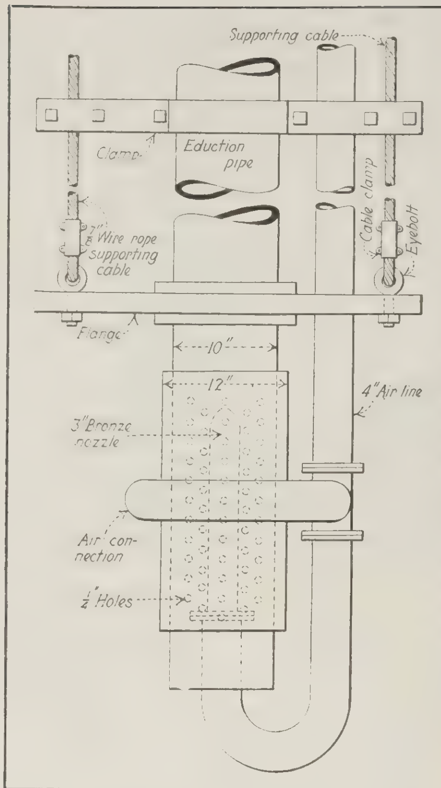


FIG. 1

**Foot Piece and Fastenings**

The air was broken up into small streams by entering the eduction pipe through ½-in. holes. Both a jacket and a nozzle assisted in introducing the air into the pipe. All the weight was taken on wire cables attached to a flange fastened to the junction between the last whole section of pipe and the foot piece.

out of a straight 5-ft. section of 10-in. pipe drilled full of ½-in. holes except near each end, as shown in Fig. 1. Around the perforated part of the pipe a short section of 12-in. pipe was welded in such a manner as to form a jacket or chamber. At diametrically opposite points in this outer pipe connections were made to the air line. An additional part of the foot piece was a 3-in. bronze nozzle also connected to the 4-in. air line. Thus the construction of the foot piece was such that a large volume of air broken up into many fine streams had easy access into the eduction pipe.

The ideal design of an air lift eduction pipe or discharge line is one which properly tapers throughout its whole length in proportion to the expansion of the air bubbles as they rise in the pipe. Such a tube is hardly practical because the length and taper of the pipe would be different for every different air lift. However, to approach such a characteristic the air lift discharge lines at the Neilson mine were made of three different size pipes. When the air lifts were stopped from pumping directly to the outside surface they consisted of a lower section of 10-in. pipe 200 ft. long to which was attached another 200-ft. section of 11-in. pipe and at the top was still another section of 12-in. pipe about 240 ft. long.

The ultimate total weight of one of these eduction pipes was nearly 20 tons and, consequently, required strong supports. In addition to suspending the air and discharge pipes, arrangements had to be such that extra pieces of pipe could be added and the whole column line lowered as the water level receded.

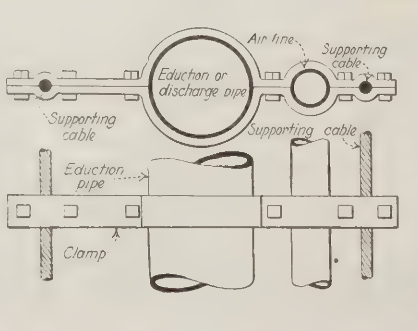

FIG. 2

**Pipe and Rope Clamp**

To keep the eduction and air pipes properly aligned, clamps were placed at various points along the line. In this manner the total weight of the pipes was suspended on the cables.

One of the most essential features effecting the successful operation of an air lift is the submergence of the eduction pipe. Obviously, as the level of the water in the Neilson shaft became lower the pipes had to be dropped so as to maintain sufficient submergence. To accomplish such adjustments as efficiently and quickly as possible, all extra sections of pipe were added to the top and the whole eduction pipe was suspended on ⅞-in. steel hoisting cables.

At the junction of the foot piece and bottom section of pipe a large round collar or flange was inserted. Sufficiently spaced from the outer edge of this ring two eye-bolts were attached as shown in Fig. 1. To these bolts the ⅞-in. supporting ropes were attached. At various positions along the discharge pipe, clamps similar to those shown in Fig. 2 were used to hold the pipe to the ropes and also tie the 4-in. air line to the large pipe.

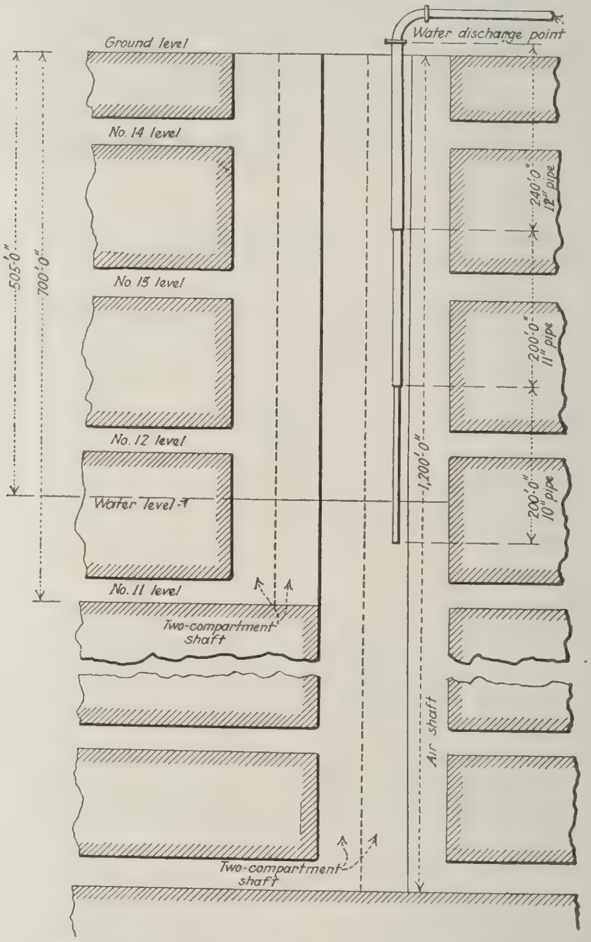

**Fig. 3—Sketch Showing Air Lift and Shaft**

Two compartments extend to the No. 11 level and two to the bottom level. The air lift was first used to discharge the water to the ground level as shown here. Now pumps are located on the No. 12 level and the air lift has been moved down the shaft so that it discharges into a basin in the No. 12 level from which it is relayed to the surface by two 1,000-gal. per minute, centrifugal pumps.

The support at the top of the shaft was as shown in Figs. 4 and 5. Two rope clamps 10 in. long were attached to each rope and the weight of the pipes was supported on a yoke or cross member which in turn rested on heavy beams. Each rope extended over the headframe onto a reel from which it was unrolled as required.

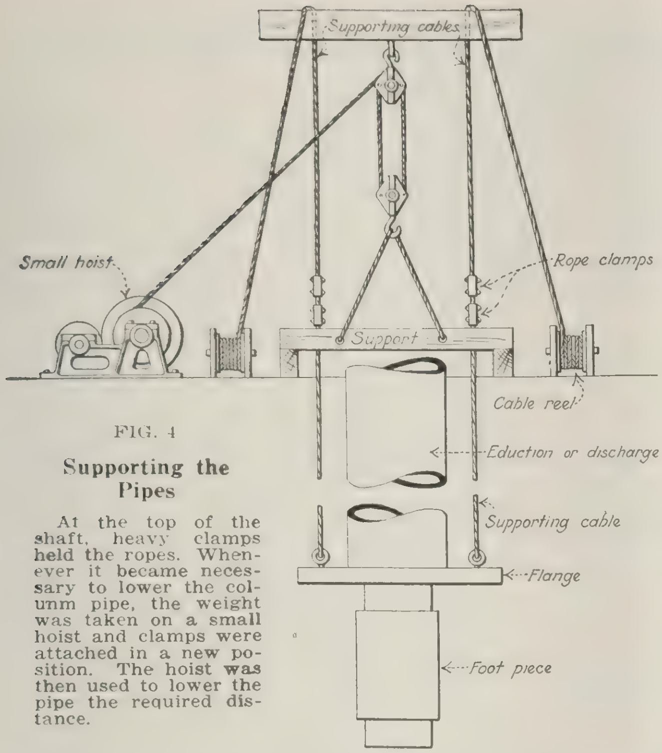

FIG. 4

**Supporting the Pipes**

At the top of the shaft, heavy clamps held the ropes. Whenever it became necessary to lower the colunm pipe, the weight was taken on a small hoist and clamps were attached in a new position. The hoist was then used to lower the pipe the required distance.

When it became necessary to attach additional sections of pipe and lower the column line, other clamps were placed on the ropes farther up near the top. When this was done the weight of the pipe was placed upon large pulley blocks which operated through a cable connected to a small hoisting engine. In this manner the pipes were lowered until their weight again rested on the new clamps. See Fig. 4.

During the period between Nov. 9, 1924, and Feb. 19, 1925, one or the other or both of the air lifts were in almost continuous operation. As a matter of fact, only about 65 hr. of operating time was lost in making the various changes to the lifts.

On Feb. 19, when the lifts were stopped from pumping to the outside surface, the eduction pipes were 640 ft. long and the water had been lowered about 475 ft. This indicates that the water level dropped at the rate of about 4½ ft. every 24 hr. It has also been estimated that during part of the time 5,000 gal. per minute was pumped and a total of about 335,000,000 gal. was raised to the surface.

The discharge from the air lifts varied, as would be expected, depending upon the amount of submergence and depth from which the water had to be raised. Best results were obtained when the submergence was about 200 ft. and the lift about 100 ft. Averaged over the whole range of operation the cost of raising the water was slightly over 6.5c. per 1,000 gal.

Although the total depth of the shaft at this mine is about 1,200 ft., the mine workings extend about 200 ft. lower. Obviously, the work of unwatering the mine was not complete when, on Feb. 19, the air lifts were stopped from pumping to the surface.

Fig. 3 shows the arrangement of the shaft. Two compartments go down to the No. 11 level which is about 700 ft. from the surface at this point. The two other hoisting compartments extend to a point 1,200 ft. from the surface. An airway also goes to the bottom level. In all, probably sixteen coal beds are cut by the whole shaft.

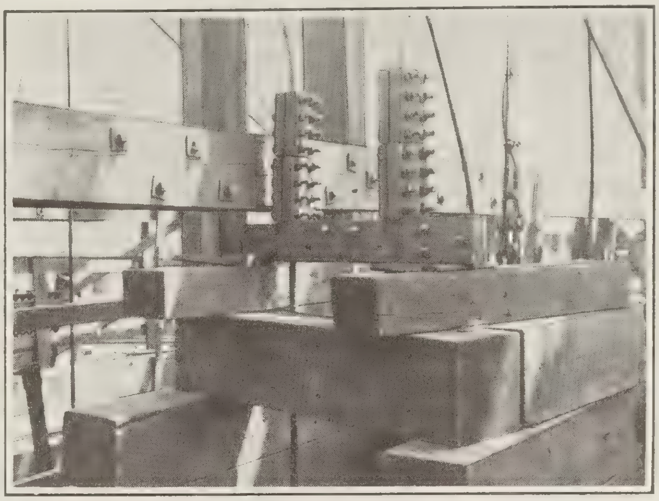

**Fig. 5—Rope Clamps Prevent Cables from Slipping**

Two large clamps were fastened to each wire and the weight of the pipes supported on cribbing which spanned the mine shaft.

The dewatering of the mine having reached the point attained on Feb. 19, air-lift pumping to the surface was discontinued so as to finish the job as efficiently as possible. Since then two 1,000-gal. per minute pumps have been set up in the No. 12 level and the air lift discharges to these units which in turn relay the water to the surface. In time, two more centrifugal pumps will be located in the No. 11 level and the water relayed

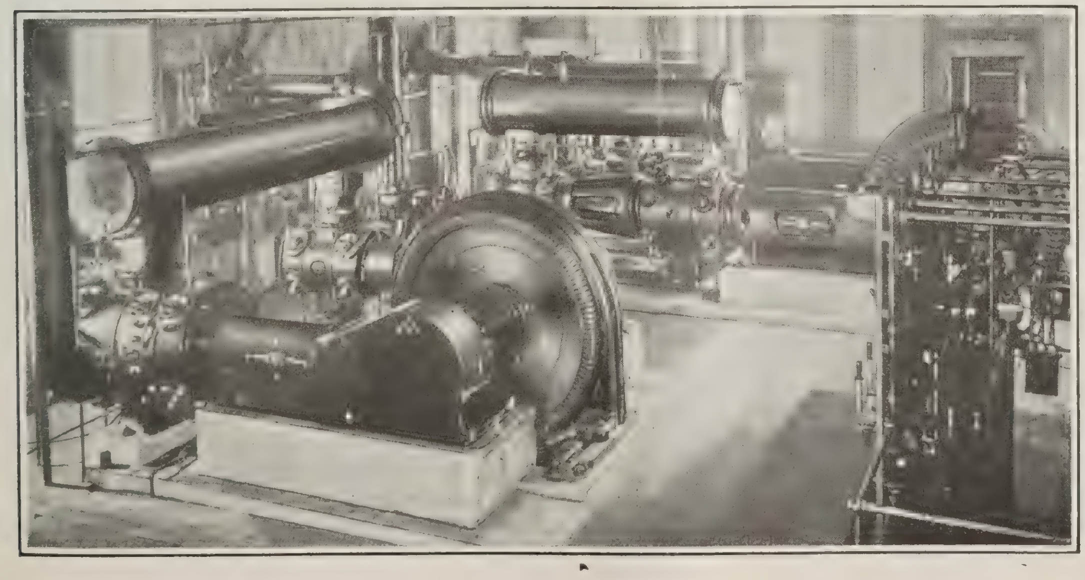

FIG. 6

**Compressors for Air Lifts**

Both of these units worked together to supply air to the two air lifts. An 8-in. pipe conveyed the air to the shaft and from there it was dropped into the shaft through two 4-in. air pipes. Each air line was attached to the outside of the discharge pipe.

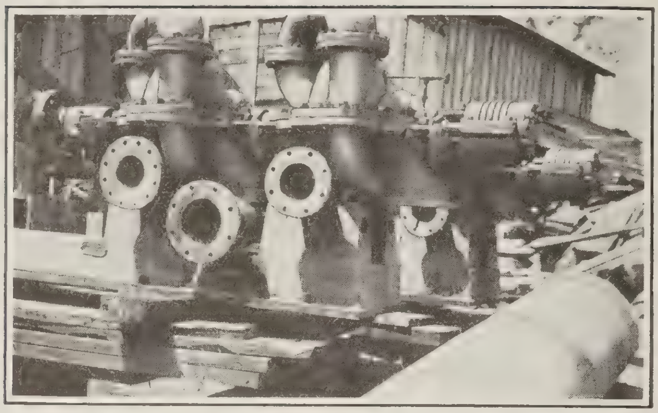

**Fig. 7—Units for Permanent Mine Service**

These are two of the centrifugal pumps which will be permanently located inside the mine to take care of the regular inflow after the coal beds are unwatered.

to them by the air lift. In this manner it is intended to carry the unwatering plan until the air-lift system will be impractical for further use here.

The success of the Shamokin Coal Co. with the air-lift method of raising water recalls to memory three other important applications of the system in the anthracite region. These were made by the Glen Alden Coal Co. at Hampton Water Shaft, the Hudson Coal Co. near Carbondale, Pa., and the Madeira, Hill & Co.

# Natal Mines Four Million Tons Of Coal Yearly

### Seams Are Thin and in Most Cases Split —Volatile Matter Varies Widely but Is Always Low—Dolerite Sheets and Dykes

Coal was discovered in Natal in the year 1838, but beyond this bare statement no further information is obtainable. "On Aug. 20, 1842," says W. J. Wybergh in his small monograph on "The Inland Coalfields of Natal," Vol. II of "The Coal Resources of the Union of South Africa," published by Geological Survey of that commonwealth, "Captain Smith, writing from Pietermaritzburg to Sir George Napier, stated that there was no doubt that coal existed in considerable quantities about 130 miles from the coast and advocated the formation of a company to work it." In 1888 a number of mines were opened, of which the Newcastle Colliery, Elandslaagte Colliery and Dundee Coal Co. mine still exist.

During the first year the coal was transported by bullock wagon, but before the year was over a branch was constructed by the company from Glencoe to Dundee, since taken over by the Government and made part of the Glencoe-Vryheid-Piet Relief Ry. In that year the bunker trade was successfully inaugurated on a commercial scale, a total of 686 tons being taken by six steamers. The total tonnage, coal and rock mined in 1923 was 5,618,404, of which 1,124,947 short tons was classified as waste. The total coal sold was 4,302,892 short tons for which $8,251,390 was received, or $1.92 per ton.

There are three main fields—the Klip River, the Vryheid and the Utrecht. In the Klip River are only two seams of commercial value the "Top" and the "Bottom." In only a few collieries can both seams be worked over the whole area, though in most cases at least a portion of both have been considered workable under existing economic conditions. The coal is quite usually gaseous, even in some cases where it is covered by only 70 ft. of cover.

Some have ascribed this to the action of igneous sheets which are from 25 to 380 ft. thick and are found from 60 to 398 ft. above the coal. Some declare that these sheets prevent the gas from escaping, but the author quotes Mr. Steart to the effect that the sandstones and shales are more impervious than the dolerite sheets. The effect of the dolerite on the percentage of volatiles in the coal does not seem to accord with any rule, certainly not with the rule that the effect will be found to vary with the thickness of the sheet ($T$) and inversely as the thickness of intervening measures ($D$). In one place $D \div T = 1.8$, that is, the protecting measure is thicker than the molten sheet. Here the percentage of volatile matter is 8.48 and the coal is practically an anthracite. In another place the $D \div T = 0.7$, that is the protecting measure is thinner than the molten sheet, yet the percentage of volatile matter is 20.77. The thickness of the sheet is 310 ft. and the thickness of the intervening strata only 206 ft. Nevertheless, the coal is distinctly semi-bituminous and not anthracite.

As the author states "It is more than likely that not merely the ratio $D \div T$ but the absolute distance from the coal irrespective of thickness" must be considered.

"Of course," says Mr. Wybergh, "where the percentage of volatiles is unexpectedly low, this may, in some cases, be due to the proximity of a vertical or highly inclined dyke not disclosed by the borehole, or conceivably, but improbably, to the existence of another sheet below the coal." At the New Campbell colliery a dyke over 1,200 ft. thick was struck about 100 ft. from the shaft, at which point the coal contained 4 per cent of volatile matter. At a distance of 1,200 ft. from the dyke it had 15 per cent of volatile matter and at 1,400 ft. it had 19 per cent, and the coal showed indications of coking.

### Splits Reduce Value of Seams

The coal is extensively faulted and the parting between the Top and Bottom coals varies from a few inches to 40 or 50 ft., and even in a single colliery from one foot to 50 ft. The thicknesses of these splits vary from less than 2 ft. to 10 ft. or more but in the greater part of the area are between 3 ft. and 5 ft. thick. The ash percentage in the coal as used at Capetown varies from 9.89 to 15.60.

In the Vryheid district are four commercial seams, the Alfred, Gus, Dundas and Coking seams and others of lesser importance. The Gus seam is usually unsplit and runs from 4 ft. to 6 ft. 8 in. The Coking seam is thin and runs from 1 ft. 2 in. to 2 ft. 6 in. The Alfred and Dundas seams frequently split, but in one place the latter contains two layers 4 ft. 7 in. and 4 ft. 3 in. respectively, with a shale parting. The sulphur in these seams is quite low, 0.50 to 1.20 per cent. The ash runs from 7.44 to 15.95 per cent and the volatile matter from 10.22 to 26.06 per cent. Here, also, are igneous sheets, dykes and faults.

The Utrecht coal field has no railroad, but it contains some of the best coal in Natal. The same seams are found as in the Vryheid district. Thus at the Utrecht colliery the Alfred seam is 6 ft. 1 in. thick, the Gus seam 5 ft. and the Dundas seam 2 ft. At Dumbe Mountain these seams are 6 ft., 3 ft. 6 in. and 6 ft. 5 in. respectively, with the Coking seam 3 ft.

# Alternators Supplying Mine Loads Are Easily and Safely Paralleled and Operated

## Fluctuating Loads Make Special Precautions Necessary—Synchroscopes Can Be Made from Lamps and Voltmeters—Diagrams Explain Bad Effects of Poor Power Factors

By **J. A. Erskine**
Pittsburgh Terminal Coal Co.,
Pittsburgh, Pa.

THE INCREASED use of electricity in the working of mines necessitates in many cases a power plant comparable in size with that for supplying light and power for a fairly large sized town. The colliery electrician has, therefore, to take charge of a plant where alternators frequently are required to run in parallel and connected to a load which is certainly not helpful to good parallel operation. The aim of this article is to show how this difficulty can be overcome.

The work of paralleling alternating-current machines is a more difficult operation than is the case with continuous-current generators. With direct-current generators the only important point is that the voltage of the incoming machine should be the same as the busbar voltage.

With alternating-current machines not only must the voltage be the same but the periodicity also. Further than this, the machines must be in phase; that is to say, it is not sufficient for the periodicity of the machines to be exactly the same, but the voltage of the machines must rise and fall at the same instant.

The process of bringing machines into phase is called synchronizing. "Synchronous" means that the pressures and currents rise and fall exactly at the same time. Two alternators to be connected in parallel, must both be of the same pressure and current at the same instant; each must be at the positive maximum of pressure and current at the same instant; each must be at zero pressure and current at the same instant. At any instant the pressure furnished by each machine must be exactly the same.

When connecting three-phase machines in parallel, like phases must be connected together; that is to say, referring to Fig. 1, phase *1* of the two machines to be paralleled must be connected together; phase *2* of the two machines connected together, and so also with phase *3*. If phase *2* of one machine is connected to phase *3* of the other machine, and, say, phase *3* of the first machine to phase *2* of the second machine, the machines will not parallel, and large currents will pass between them.

Fig. 1 shows diagrammatically the three phases of two machines that are to be paralleled, and how the connections should be made. It will be noticed that phase *1* of the left-hand machine is connected to phase *1* of the right-hand machine, phase *2* of the left to phase *2* of the right-hand machine, and phase *3* to phase *3*. Fig. 2 shows diagrammatically the same two machines, but with their phases connected incorrectly. From this diagram it will be seen that while phase *1* of the left-hand machine is connected as before to phase *1* of the right-hand machine, phase *3* of the left-hand machine is connected to phase *2* of the right-hand machine; and phase *2* of the left-hand to phase *3* of the right-hand.

The difference in the arrangement of the phases between the right-hand machine and the left-hand one will be recognized as that which is used to reverse the direction of rotation of an induction motor. And this provides the test for ensuring that the phases are in proper sequence. Before connecting two alternators to run in parallel, if there is any doubt as to the sequence of the phases of the two machines, each of them should be tried upon an induction motor. If the motor runs in the same direction with the currents from both machines, they may be safely connected in parallel; if not, it will be necessary to alter the connections of one of the alternators, so as to bring them into the proper sequence as shown in Fig. 1.

When an alternator is to be connected in parallel with others that are running, it is first brought up to about the speed at which it will run when taking its share of the load. The exciting current of the field magnets is then brought up to the strength that will give the pressure the machine is to furnish when running in parallel. The third step is to bring the machine into exact synchronism. Synchronism is obtained by varying the speed at which the incoming alternator is running. Having the speed near that at which it is it to run, the revolutions are slightly increased or decreased, until the phases of the incoming machine are exactly in synchronism with the machine already at work.

The main object of synchronism is to prevent the

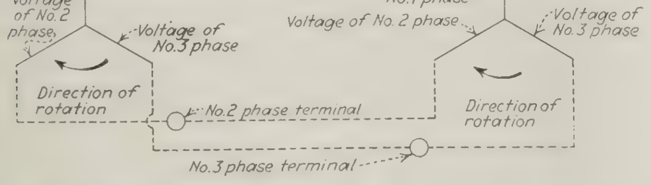

**Fig. 1—Three-Phase Machines Connected in Parallel**

It is important that each phase be properly arranged so that the circulating current will be low.

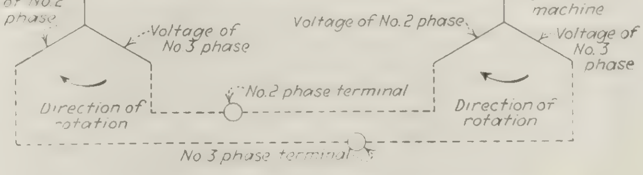

**Fig. 2—Incorrect Phase Arrangement**

The phase rotation in each circuit must be the same before the machines are switched together.

passage of useless current between two or more alternators when running. If any alternator is out of step with the others, currents will pass between the machines, the power for which has to be furnished by the prime movers. These currents operate against the successful working of the units. The operation of getting the incoming machine into exact synchronism requires a certain amount of nerve to throw in the switch at the right moment, and, of course, some form of synchronizing apparatus is required. When a lamp synchronizer is used, it is the usual custom to also have a synchronizing voltmeter. The lamp synchronizer is not so good a guide as the voltmeter, but the two together should enable the engineer in charge to know the exact moment to close the switch.

With low-tension machines, the lamp is connected between two similar phases of the two machines; or say, between a certain phase of the incoming machine and the same phase of the busbars. This arrangement is shown diagrammatically in Fig. 3, and for simplicity the connections between the other phases are omitted. When the machines are in synchronism, the pressures delivered by the phases of the two machines to which the lamp is connected are exactly equal at all parts of the cycle, and therefore no current passes through the lamp.

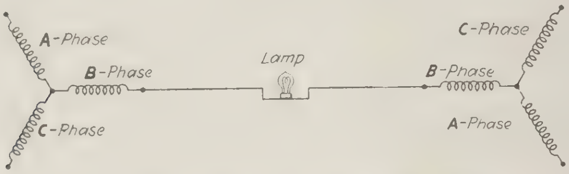

**Fig. 3—Lamp Used to Synchronize Generators**

Note that the lamp is connected into one conductor only. If the phase rotation, voltage and frequency are correct, a lamp in one line is all that is necessary to determine when to close the paralleling switch.

For high-tension machines, a modification is shown diagrammatically in Fig. 4. A transformer is wound with a primary coil for each generator; or, say, a primary for the busbars and another primary for the incoming machine. The secondary of the transformer is connected to the lamp. The primaries are so wound that they oppose each other; and when the two machines are in phase, no lines of force are created in the magnetic circuit of the transformer. Therefore, there is no secondary pressure at the terminals of the lamp, and no current flows.

In a further modification of the arrangement shown in Fig. 4, the primary coils are so wound that when the machines are in phase, sufficient pressure is induced in the secondary coil to light the lamp to which it is connected to its full brilliance.

In another arrangement connections from the different phases are made so that certain lamps light and certain others are dark when the machines are in synchronism.

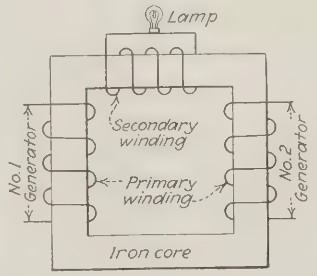

FIG. 4

**Lamp and Transformer**

When a heavier voltage than the lamp can withstand is used, a transformer reduces the line voltage. Care must be taken to connect the transformer and lamp, otherwise incorrect results will be obtained.

S
P
P
One of the alternators already running
Alternator to be switched in

**Fig. 5—Voltmeter Aids Work of Synchronizing**

The light of a lamp varies and, therefore, it is sometimes quite difficult to tell when it is at its maximum brilliance; a voltmeter is often used with a lamp to overcome this difficulty.

With the lamp and voltmeter synchronizer shown in Fig. 5, the method of synchronizing is as follows: The primaries *pp* of the two step-down transformers are connected, one to the two busbars, and the other to the machine to be synchronized; while the secondaries *ss* are joined in series and connected to an incandescent lamp and a voltmeter, as shown in Fig. 5. The lamp should be a carbon-filament one, so as to be very susceptible to changes in the current through it. It also must be suitable for the full voltage of $s + s$.

The windings of the transformers are so connected that when the voltages in the secondaries are in step, they work together; but if out of step, they oppose each other more or less. If the frequency of the alternator to be switched in is not correct, the lamp lights up and goes out at rapid intervals. The speed of the machine must then be adjusted until the light of the lamp rises and falls only a few times a minute. This shows that the speed and, therefore, the frequency also are correct. The machine is then switched in at the moment the lamp is fully lighted and the voltmeter reading is at its maximum. This indicates that the machine is in synchronism with the others. Before closing the switch, the alternator voltage must, of course, be adjusted to correspond with that of the busbars.

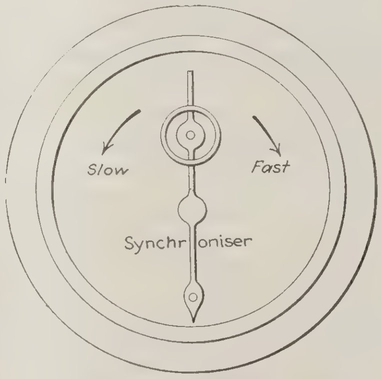

FIG. 6

**Rotary Synchroscope**

This instrument indicates whether the machine to be put on the line is running too fast or too slow.

A more recently developed arrangement than that shown indicates not only synchronism but also whether the incoming alternator is running too fast or too slow, or if it is simply out of phase.

This type, an example of which is given in Fig. 6, is termed a rotary synchronizer. It has a rotating pointer which moves in one direction or the other while the incoming machine is out of synchronism. If the pointer rotates clockwise, the incoming machine is too fast; if counter clockwise, the machine is too slow.

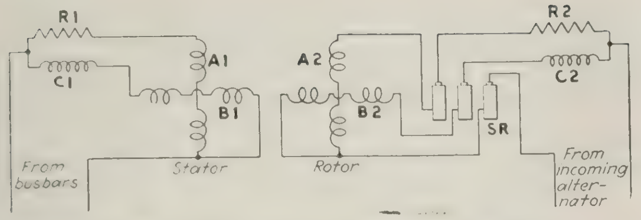

**Fig. 7—How the Synchroscope Works**

The device contains a simple slip-ring motor which runs at a speed and direction depending upon the frequency of the current supplied to its stator and rotor.

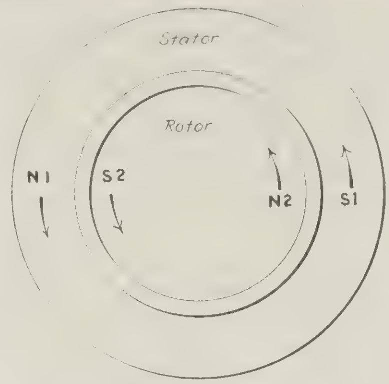

FIG. 8

**Fields Establish Speed**

The rotor circuit drives the indicator needle by the force tending to hold the magnetic fields together.

The principle of this instrument is shown in Figs. 7 and 8. The essential part of the apparatus consists of a miniature slip-ring motor. The stator and rotor are both wound for two phases, and in series with these are connected non-inductive resistances *R1 R2* (in the form of incandescent lamps) and choking coils *C1 C2;* The connections to the rotor being made by means of three slip-rings marked *SR.*

In Fig. 7, the windings *A1* and *B1* produce a rotating field, the speed of which depends upon the frequency of the busbar supply; and windings, *A2* and *B2* also set up a rotating field, whose speed corresponds to the frequency of the incoming alternator.

The device is arranged so that these two fields, indicated by *N1 S1* and *N2 S2* respectively in Fig. 8, shall rotate in the same direction; and it will be evident that owing to magnetic attraction between *N1 S2* and *N2 S1*, the rotor field *N2 S2* will always try to follow the stator field.

If the two fields are rotating at the same speed, that is, if the frequency of the incoming machines is the same as that of the busbars, the rotor will remain stationary. But suppose the two frequencies are not the same, and that *N1 S1* is rotating at, say, 1,500 r.p.m., and *N2 S2* at 1,400 r.p.m., when the rotor is at a standstill; then, in order that *N2 S2* may still keep pace with *N1 S1*, the rotor must turn in the same direction, namely, counter clockwise in Fig. 8, at the rate of 100 r.p.m. The pointer which is attached to the rotor would thus travel around the dial in Fig. 6, at 100 r.p.m. in the direction marked "Slow." On the other hand, suppose *N2 S2* is rotating at 1,600 r.p.m. when the rotor is held stationary due to the incoming alternator running at too high a frequency; then for *N2 S2* still to keep in step with *N1 S1*, the rotor will turn backward, or clockwise, at a speed of 100 r.p.m. This would be indicated on the dial by the pointer indicating "Fast."

Now, in addition to equality of frequency, the voltage of the incoming alternator must also be in phase with

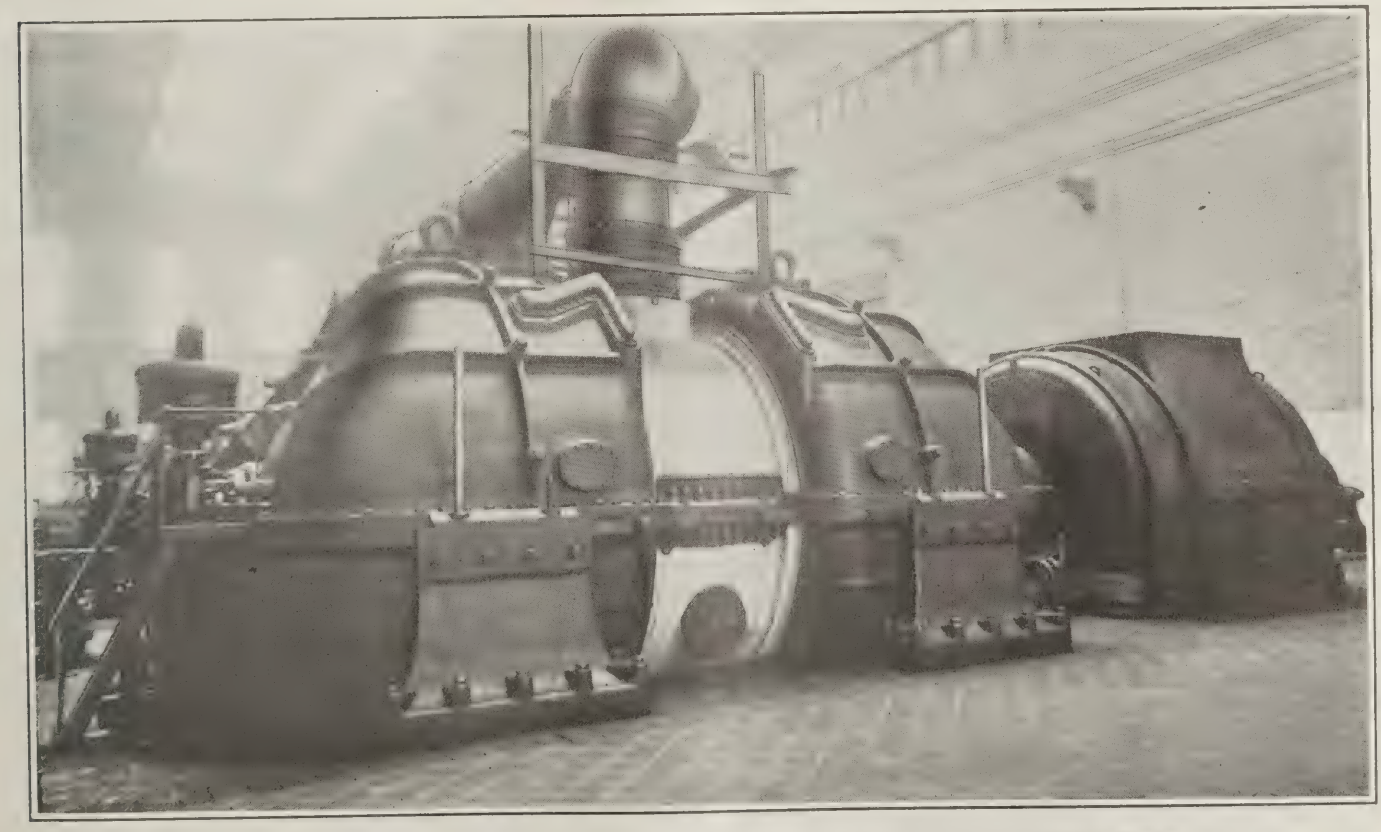

**Fig. 9—High Fuel Economies and Reliability Have Reduced Power Generating Costs**

Only by using modern type generating units can a power house supply electrical energy at an economic rate today. Recent advances in the design and construction of large turbo-generator units such as this have made them so highly efficient that the savings which they make over old types justify the expense of replacing the old units that of the busbars. This is indicated by the synchroscope pointer being vertical. If it is in any other position, the voltages are out of phase, the deflection of the pointer from the vertical being an indication of the phase difference.

As regards the actual process of synchronizing, the speed of the alternator is adjusted until the pointer of the synchroscope is rotating very slowly, say at about 2 or 3 r.p.m.

Then, after adjusting the voltage of the alternator to that of the busbars the alternator switch is closed just as the pointer is coming to the vertical position.

For high-voltage circuits, the synchroscope is used in conjunction with a small step-down transformer, the secondary voltage of which is usually arranged for about 100 volts. The transformer used for this purpose is referred to as a potential transformer.

In collieries there is usually a large number of induction motors, and the power factor is low. Where the power factor is less than unity the current lags behind the pressure, and the exciting current has to be larger than with unity power factor. The lagging current tends to weaken the field, and an increase of the exciting current, therefore, is necessary to make up for this weakening.

Following this idea it will be found that if any particular alternator is overexcited, it will furnish a lagging current. In this matter its action is the reverse of that of a synchronous motor, which is, of course, an alternator run as a motor. When a synchronous motor is overexcited, it furnishes a leading current to the service, and on this occasion such a motor is often employed for the purpose of raising the power factor of a particular service.

When two or more alternators are running in parallel, if one of them is overexcited it commences to furnish a lagging current, and as a consequence, the others tend to furnish a leading current. Induction motors have comparatively low power factors, and, therefore, demand lagging currents, which the alternators have to supply.

If one alternator has a higher excitation than the others, it tends to supply more of the lagging current, and the other machines tend to work at nearer unity power factor, or, in other words, tend to furnish a smaller lagging current, or a leading current. On the other hand, an alternator, if under excited, gives a leading current, which is again the opposite to the action of a synchronous motor.

The question of the action of its excitation upon each particular alternator must not be confused with the action of the speed. It is the speed which practically determines the amount of load which each alternator takes to itself. Any increase of speed of an individual alternator causes it to take up more of the load and the other machines to drop a portion of it. But it is the variation of the exciting current of each alternator which causes the variation in the power factor of each alternator.

When the current is constantly changing in a circuit forming part of an electro-magnetic system, as in an alternating-current generator or motor, a voltage is induced in the circuit, which opposes the change of current. This pressure depends upon the rate of the change of current, its maximum value occurring when the current is passing through its zero value, that is where the maximum rate of change takes place. The minimum value occurs when the current is at its maximum, or when the rate of change is least. This induced voltage, therefore, is in quadrature with the current.

Fig. 11 shows diagrammatically three poles of an alternator, with one coil of the armature passing in front of the north pole. With the coil in the position shown, and the power factor unity, the volts and am-

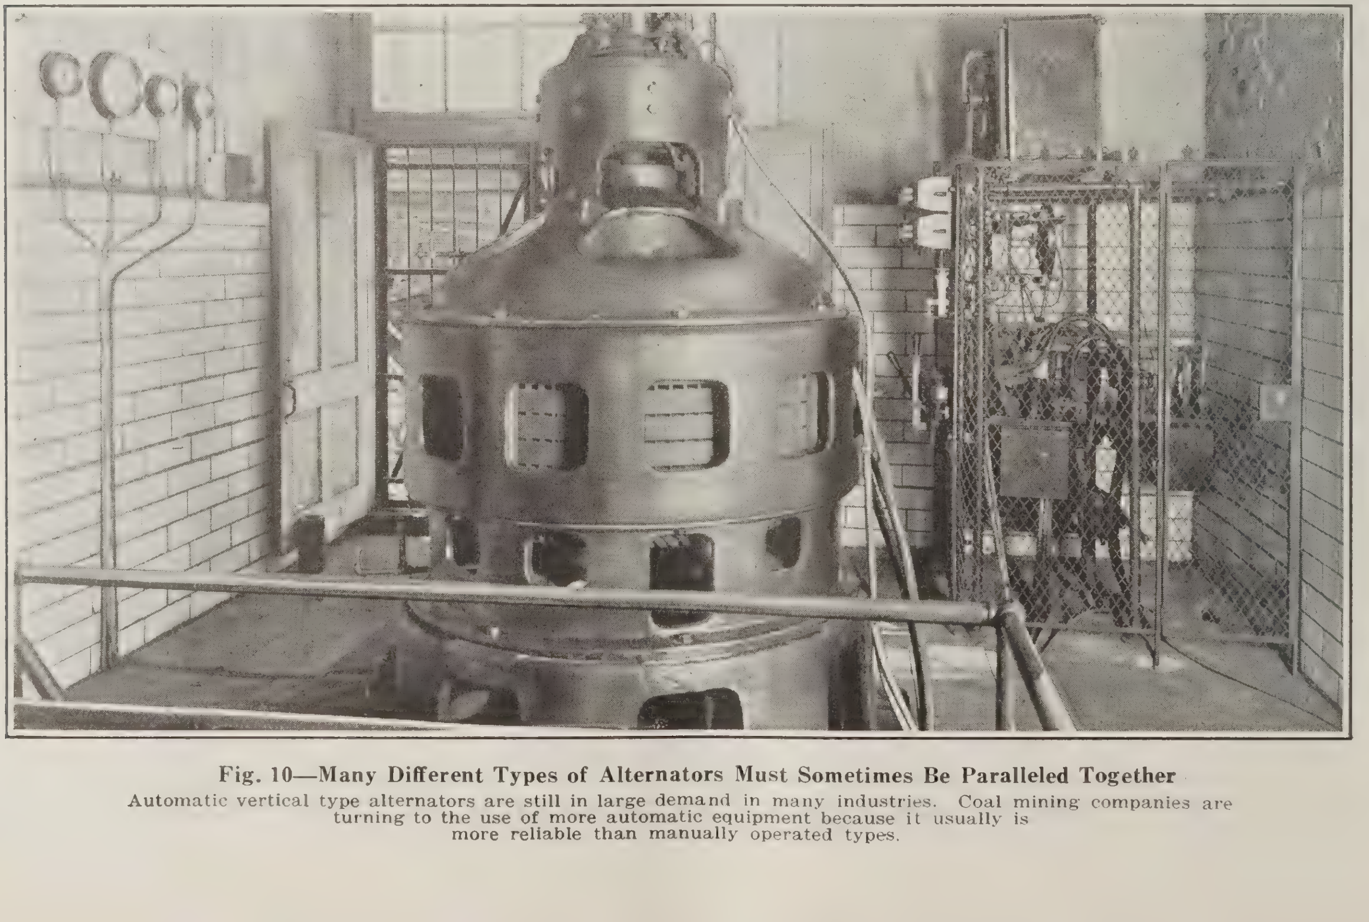

**Fig. 10—Many Different Types of Alternators Must Sometimes Be Paralleled Together**

Automatic vertical type alternators are still in large demand in many industries. Coal mining companies are turning to the use of more automatic equipment because it usually is more reliable than manually operated types.

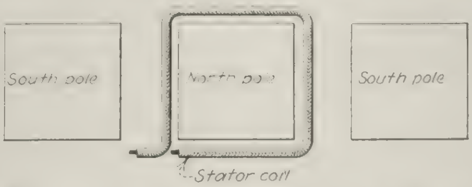

**Fig. 11—Unity Power Factor Load Requires a Normal Field**

With a unity power factor load, an alternator coil in this position exerts no dampening effect on the field pole, but when the current lags the voltage, the current in the stator coil when it reaches this position demagnetizes part of the field.

peres are passing together through their zero values; but should the generator be working on an inductive load, the current tends to lag behind the voltage. As the coil approaches the position shown in Fig. 11, it will still have a current flowing in it which was induced by the last south pole. The direction of this current will be such that its magnetic effect will be in opposition to that of the north pole; consequently, the actual magnetic effect produced by the north pole will be the resultant of these two magnetic influences. It must be less than when the north pole is not opposed by an armature coil carrying a current. This partly explains why an inductive load weakens the field of the generator, and necessitates a larger exciting current to maintain a voltage constant.

Machines which have the same armature reaction run better in parallel than those differing in that respect, because the latter require constant alteration of their exciting currents. When two alternators which have not the same armature reaction are run in parallel, if their exciting currents do not receive constant attention, the effect upon the machine is similar to that which would be produced by improperly varying the excitation. The armature reaction will vary with every change in the inductive load, because the power factor of the circuit—and, therefore, the strength of the lagging current—will be changing.

The protection of alternators while they are running in parallel, and while being synchronized, is an important detail and deserves some consideration. In colliery work, continuity of supply of power is the most important matter to be considered. It is, therefore, essential that, in case of poor synchronizing, both generators shall not be disconnected from the circuit. This is guarded against by fitting reverse current relays on each generator.

These reverse current relays protect either machine from being motored. The relays are set to operate on a small percentage of the full-load current of each machine. They are made on the same principle as an ordinary wattmeter. In case of a reversal of current, the instrument also reverses, and closes a load circuit in which the machine circuit-breaker is included. It is also essential that time-limit relays should be fixed for each generator. The time limit should depend upon the load. Should an incoming machine be running too fast when switched in, and it snatches all the load, a time limit gives the machines a chance to right themselves before they are cut out.

In the working of a colliery power station, synchronizing is often difficult, owing to the inability of the loaded generators to run absolutely steady; this, again, being due to the fact that the prime movers are unable to follow the variations of the load without a small time lag. The variations in the speed of the engine are always a little behind the power demand.

I find it better to have the needle of the synchroscope, where such an instrument is employed, a little fast before switching in, instead of the reverse method, as is sometimes advocated. One may wait a few seconds after the machines are in step, but it may happen that the very moment the switch is closed, either a load comes on, or it is removed from the machine already running, and the machines fall out of step before the switch is properly home. If the synchronizer reads a little fast, the incoming machine will probably fall very nicely into step, as there is always a certain pull upon any machine when first taking its load.

The diagrams apparently relate only to single-phase alternators, since there are only two wires from the machines. But as a matter of fact, these arrangements are also applicable to two- and three-phase alternators, as connection has only to be made to one phase in these cases. Three-phase alternators, for instance, are connected to three busbars, and the two busbar wires of the synchronizer are joined up to two of these bars. The other pair of wires from the synchronizer goes to the corresponding phase of the incoming machine.

---

## Woodward Iron Co. Develops Crockard Mine to Produce 5,000 Tons

The plans of the Woodward Iron Co. for the development of the Crockard mine, announcement of which has previously been made in *Coal Age*, call for a shaft operation with an ultimate capacity of 5,000 tons per day. This mine is located fifteen miles northwest of Bessemer and about three miles from Mulga mine, one of the company's largest producers. The shaft will be 509 ft. deep, with a concrete lining, making a single compartment, equipped with double skips. The shaft measures 7 ft. 1 in. by 17 ft. 8½ in. in cross-section. A manway slope 17 ft. wide by 8 ft. high and 1,024 ft. long will be driven on an angle of 30 deg. The mine is said to tap the thickest coal in the Pratt seam and will have a tributary area of 40,000,000 tons of Pratt coal recoverable through the shaft.

The underground layout of the shaft bottom is somewhat unusual, providing for an elliptical yard with a six-entry system radiating therefrom. Coal will be extracted on the room-and-pillar system, blocked out in panels 2,600 ft. long. Coal will be recovered retreating.

Two commodious dormitories and a dining hall are now under construction, and additional buildings, including a hoist and power house, boiler house, machine shop and blacksmith shop will be provided as needed.

The mine will be served by a spur track four and a half miles long, which will connect with the company's coal railroad at Bone Gap, and over this line the output of the mine will be shipped to the company's large washery at Woodward. There it will be converted into coke at the Woodward byproduct plant and used in the company's district furnaces.

The initial dirt was shoveled from the shaft opening by Joseph and Alan Woodward, sons of Chairman A. H. Woodward, of the Woodward Iron Co., being representatives of the fourth generation of Woodwards, who have owned and operated this property continuously. The new mine is named in honor of Frank H. Crockard, president of the company and one of the most able mine executives in the district.

# New Kentucky Mine Has Some Cost-Reducing Features

### Drop-Bottom Cars and a Single Dump-House for Two Seams Help Justify Investment Made in Face of Trade Depression

New mines opened in the face of the prevailing depression usually are marked by features designed to reduce the cost of coal. The new mine of the Columbus Mining Co., at Allais, Ky., has such features. About two months ago the company, which for some time has operated four other mines in Perry County, Ky., opened No. 5-B directly across the hollow from old No. 5-A.

Each mine has openings in two seams which are separated by an interval of 60 to 70 ft. In both cases rope-and-button conveyors are used to retard the coal in its passage down the mountain side to the common tipple. At the older mine are two dump houses, one equipped with a rotary dump and the other with one of the cross-over type; while at the new mine there is but one dump house for the two seams and this is equipped exclusively for the use of drop-bottom mine cars. This may reduce coal-handling costs.

The rope-and-button conveyor and the common dump house of the new mine are shown in Fig. 1.

The conveyor is 840 ft. long and the average grade is 24 per cent. It is designed for a normal carrying capacity of 1,500 tons in 8 hr. From the illustration it might be construed that the conveyor structure is entirely of steel; but on the contrary the only steel used is that of the several towers or high bents at the bottom end near the tipple. The framing of the rest of the structure is of wood. The roof and sides are covered with galvanized iron.

The upper part of the dump house at No. 5-B is a sheet-iron house covering two through tracks, one of these, the load track, being equipped with a scale and a long pit, the bottom of which forms the conveyor feed hopper. The elevation of the dump house track is somewhat below the center point between the two coal seams, the approach grades being 2 per cent in favor of the loads from the upper seam and 1½ per cent against the loads from the lower steam. Fig. 3 shows the convergence of the two tram roads.

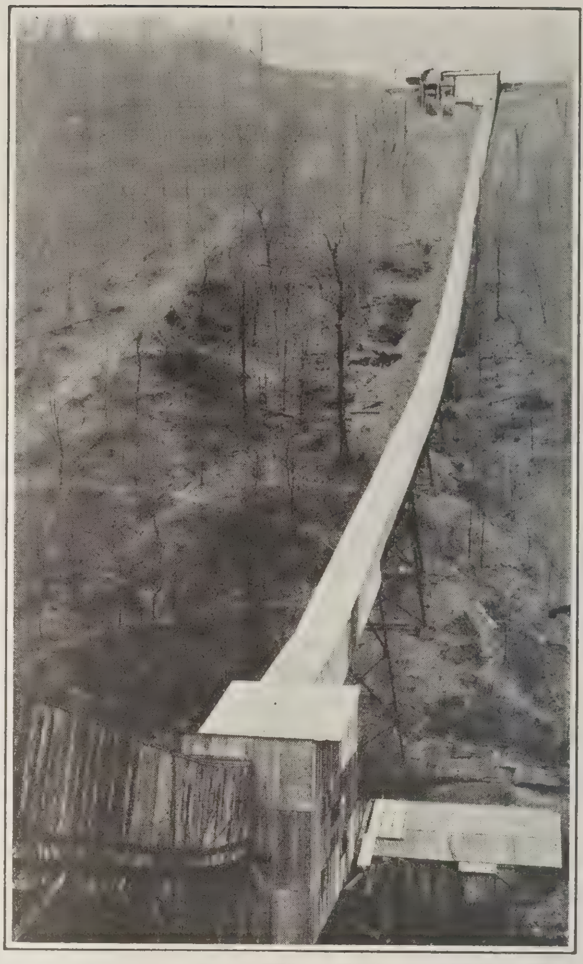

**Fig. 1—New Mine Feeds to Old Tipple**

No. 5-B started to produce about two months ago. The 840-ft. rope-and-button conveyor is designed for a normal capacity of 1,500 tons in 8 hr. Excepting the galvanized iron covering and the few steel bents at the bottom, the conveyor structure is of wood. The metal discs or buttons of the conveyor proper are 10 in. in diameter and are spaced 38 in. apart on the wire rope.

The two features of the new mine, the use of drop-bottom cars, and the one common dump house for the two seams, simplifies the installation to a marked degree. The simplicity is the more marked in this case because of the contrast afforded by the old mine directly across the hollow.

At the new mine, precautions are taken to lengthen

FIG. 2

**New Mine's Outlet**

Another view of the dump house and its approach. The trolley suspension construction is simple, neat, and of a permanent nature. The creosoted wooden railings are made up of gate-like sections of uniform dimensions set up between, and fastened to, the metal trolley posts

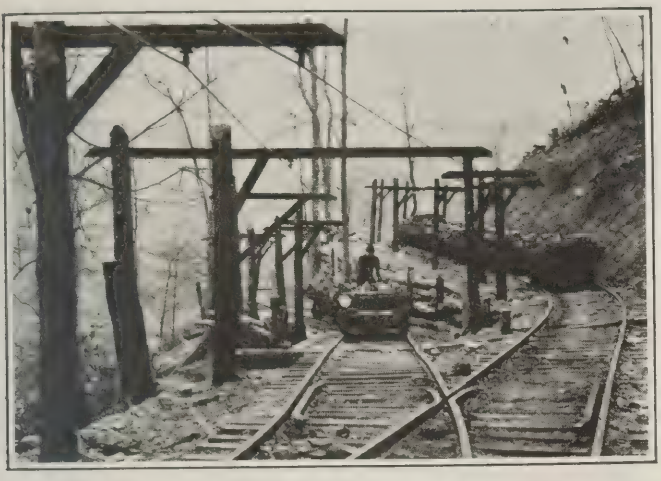

**Fig. 3—Where Coal from Two Seams Flows Together**

The tipple is at an elevation somewhat below the center point between the two seams, which are separated by an interval of 60 to 70 ft. The tracks from the two veins converge at a point about 300 ft. from the tipple. The grade from the upper seam is 2 per cent in favor of the loads and that from the lower seam 1½ per cent against the loads.

the life of the wood structures. All of the weather-exposed wood construction of the conveyor and tipple, and all wood used in the tipple approaches and tram road trolley-line supports has been given a thorough brush treatment of creosote preservative. A. F. Barbieux of Hazard, Ky., general superintendent and electrical engineer of the company's Perry County operations, estimates that the creosote coating will lengthen the life of the wood structures from three to four years. Another precaution is the setting of trolley posts in concrete, which, besides increasing the life of the posts, keeps them plumb.

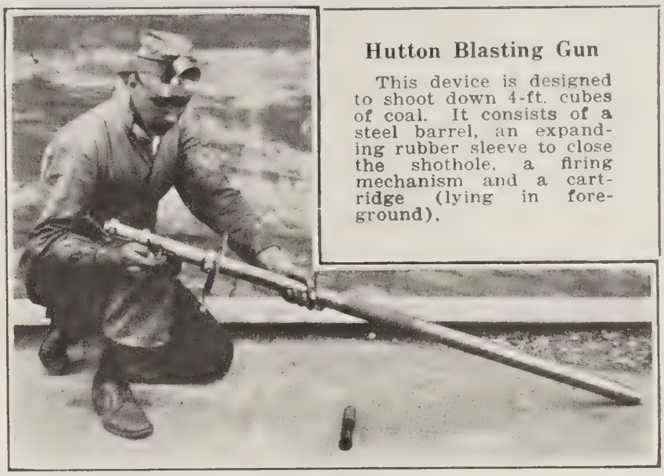
## Hutton Blasting Gun Newest Device for Shotfiring

A DEVICE for firing shots in coal to reduce the quantity of explosive used and thus to raise the factor of safety in mines has been patented by Ernest Hutton of Fairmont, W. Va. It is, essentially, a firing barrel equipped with a detonating mechanism at the "breach," a cartridge chamber at the end which is inserted in a shothole in coal and an expanding rubber sleeve to close the hole. Mr. Hutton perfected it to be used on a combination shooting, loading and conveying machine not yet manufactured but he hopes the gun will find a place for itself in coal mining whether the machine does or not. He thinks mining methods now developing may require small and frequent shots rather than the ordinary heavy charges fired at infrequent intervals.

It has been determined that the best results with the gun are obtained by shooting a block of coal not exceeding, in size, a 3½- to 4-ft. cube which is open on three sides—these three sides being the face, an open end and the undercut. This of course is a small amount of coal per shot as compared with the common methods of shooting where two or three sticks of permissible explosive per shot are used, and it is not anticipated that the gun will displace the present methods of shooting where the old methods of mining obtain.

In general appearance the gun is a piece of 2-in. pipe. It consists essentially of the following parts: First, a piece of steel tubing, 6 to 8 ft. long; second, a firing pin at the inner end where the cartridge is attached which is operated by a hammer inside of the tube, the hammer being tripped by a trigger at the outer end of the gun; third, a rubber sleeve about 18 in. long fitted over the tubing at the proper point to close the outer end of a shothole; fourth, means for expanding this rubber sleeve in the hole, preferably by compressed air, to hold the gun in position and to serve as the tamping.

The cartridge used with the gun is fitted on the inner end so that the firing pin of the gun may come in contact with a combination percussion cap and detonator. The cartridge consists of the following essential parts when ready to be fitted to the gun for firing: First, the shell of the cartridge which is of the proper diameter to receive the ordinary stick of permissible explosive and which has its base arranged to receive the combination percussion cap and detonator; second, the combination percussion cap and detonator which is fitted into the base of the cartridge, and third, the explosive proper, which may be any length from one-third to one full stick of permissible.



**Hutton Blasting Gun**

This device is designed to shoot down 4-ft. cubes of coal. It consists of a steel barrel, an expanding rubber sleeve to close the shothole, a firing mechanism and a cartridge (lying in foreground).

It is estimated that the cost of shooting coal with this gun will not, in general, exceed the cost of shooting by means of electric detonators or by the cap and fuse method, and there is a great probability that the cost per ton will be less. This, however, is not the vital consideration so far as the use of the gun is concerned.

If it finds a wide field as a shooting device, its inventor believes, it will be because of its safety of operation due to the small amount of explosive used, the proper "tamping" which it assures, and the improved quality of the coal it may produce.

**After the Wreck**

This 4-ton locomotive left the track in the tipple of Allock mine of the Carrs Fork Coal Co., at Allock, Ky., in the Hazard field. The motorman was not injured but had a narrow escape. The locomotive remained suspended by its hitching to a mine car. Instead of rerailing it in the tipple, it was lowered through the hole it had smashed in the siding, then it went back up to the mine level on a supply incline.

# New Snubber Increases Yield Of Lump Coal

### Shoulder or Notched Kerf Causes Coal to Break Advantageously and to Be Well Rolled Out Onto Mine Floor

KEEN competition in the production of coal demands that the mine product shall contain a large percentage of lump. Furthermore, the operation of the average loading machine is most efficient and can effect real savings only when the coal to be handled is properly shot and rolled out on the mine floor. The individual pieces of coal must not be too small or they cease to be lumps; on the other hand, they must not be too large or they will bind between the machine conveyor or the car and the roof. In short, present conditions demand a better mining of coal than has heretofore been necessary, and at no material increase in cost. Undercutting the face with the new type 114 Goodman snubbing machine accomplishes this result. This machine, which is shown in the accompanying illustrations, has been thoroughly tested in service with highly gratifying results.

**Fig. 1—The New Machine at Work**

In every respect the snubber resembles the standard undercutter except that it carries a short secondary cutter bar above the regular one and the base is higher. Most of the component parts of the standard machine are interchangeable with those of the snubber.

A snubbing machine is one capable of cutting a kerf resembling that made with a hand pick by the old-time miner. The old hand-made kerf was triangular in section, as shown in Fig. 2. The general shape of a hand cut kerf, with its adequate dimensions, greatly assisted in breaking down the coal and rolling it well out on the floor. It also yielded a goodly percentage of lump with a minimum expenditure of powder. With hand cutting light shots shattered the coal less and produced a larger proportion of lump than usually is obtained with machine mining. Mechanical undercutting, however, has so many important advantages well recognized throughout the coal industry that it has become indispensable.

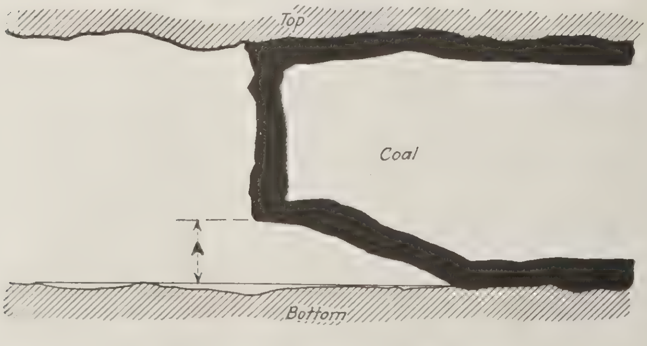


**Fig. 2—Kerf Cut with Hand Pick**

A kerf of this kind is triangular in cross-section. When the coal is shot down it naturally falls and rolls out upon the mine floor instead of merely settling in a compact mass. Light shooting with a cut of this kind therefore is equally as effective as heavier shots in a face that has been machine undercut in the ordinary manner and more lump is produced.

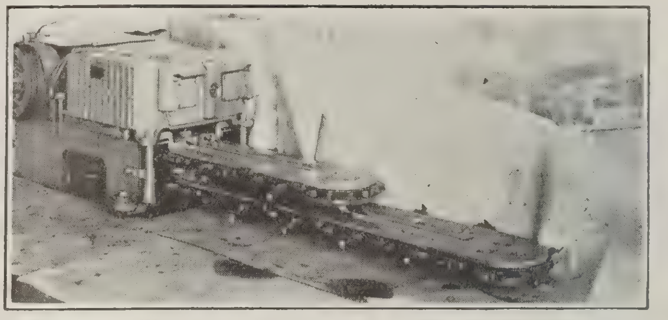

**Fig. 3—Front View of the Machine**

This well illustrates the comparative lengths of the two cutter bars. While it may be advantageous to vary the length ratios of these bars to suit local conditions the upper one usually is made about half as long as the lower.

As shown in Fig. 3 the new snubber is practically a Goodman universal-control shortwall machine equipped with high underframe and two cutter bars carrying similar cutter chains but of unequal length. Necessary reinforcements have been added to withstand the increased load arising from this construction. Wearing parts, however, have not been materially altered and are interchangeable with those of the universal shortwall machine. For this reason adoption of the snubber does not necessitate any great extension in the list of repair parts that should be kept in stock at any mine where the universal-control shortwall machine is now in use.

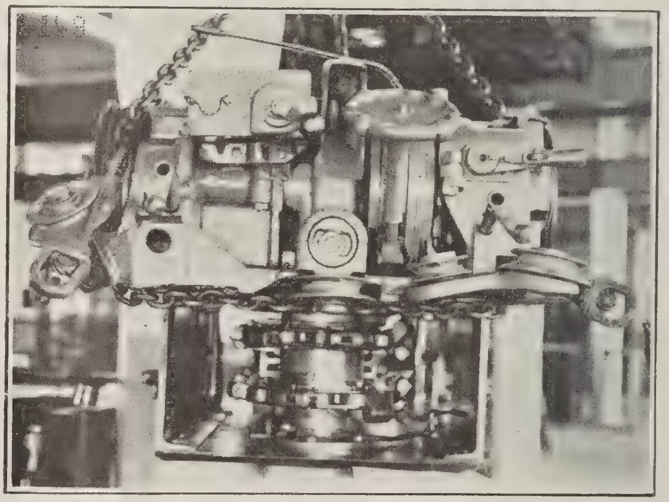

**Fig. 4—Rear View of Snubber**

The high sub-base is here well illustrated. The greater height as compared to the standard undercutting machine is made necessary by the addition of the upper or secondary cutter bar.

This new snubbing machine may be adapted to either direct or alternating current. It has a 50-hp. motor of either the open or government approved inclosed type. Its electrical equipment throughout is interchangeable with that of the universal machine of the same specification. The over-all dimensions also, except for an increase of 7 in. in height, are the same.

As shown in Fig. 3, this machine has an upper bar about half the length of the lower one. The relative lengths of the two bars, however, are subject to variation to suit local conditions. Tests indicate that the irregular shape of the kerf cut by the snubbing ma-

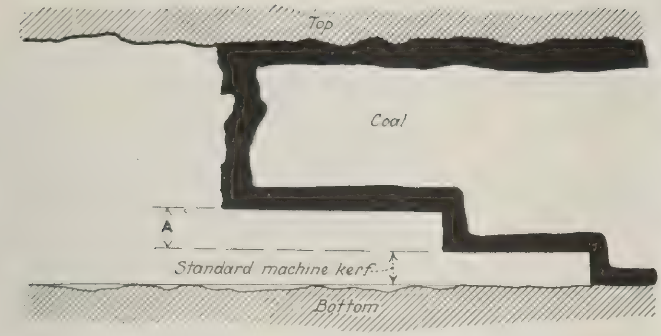

**Fig. 5—Kerf Cut by Snubbing Machine**

This is practically two standard undercutter kerfs of different depths superimposed one upon the other. In cross-section this kerf approximates that made by the hand pick or by the pneumatic puncher.

chine, as shown in Fig. 5, is more desirable than the plain wedge-shaped undercut made with hand picks. The sharp offset, corner or ledge, formed by the upper chain near the middle point of the kerf length appears to have an excellent effect in rupturing the coal when it strikes the floor, just as a notch cut into any hard substance usually forms the starting point of a break.

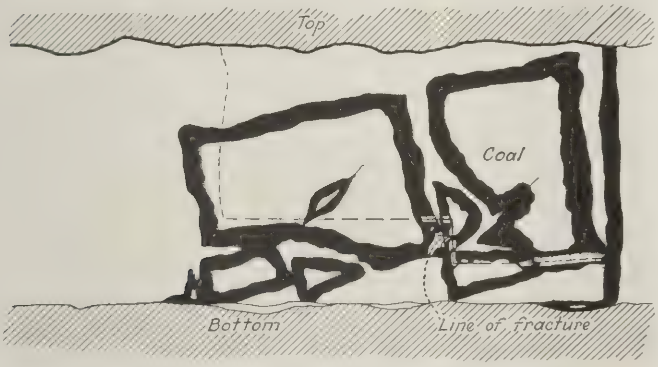

**Fig. 6—Action of Kerf Offset in Blasting**

When coal undercut by a snubbing machine is shot down the shoulder on its lower face, coming in contact with the floor rock imparts an extra shock to the falling mass. Thus not only is the tumbling action of the hand-cut kerf effected but equal results are obtained with less powder.

It seems that this ledge ruptures the coal and causes it to fall in two sections, as shown in Fig. 6, with the result that a smaller amount of powder is required than is necessary with the plain wedge-shaped undercut.

Thus the use of this machine gives a double powder saving, assures an ample rolling action and secures a maximum proportion of lump. Of course this is possible only when the shotholes are effectively placed, the explosive loaded in proper quantity and the shots correctly fired.

This new snubbing machine has given an excellent account of itself under actual mining conditions. It is easily adaptable—principally by varying the length of the two cutter bars—to meet the requirements of divergent mining conditions and the varying natures of different coals.

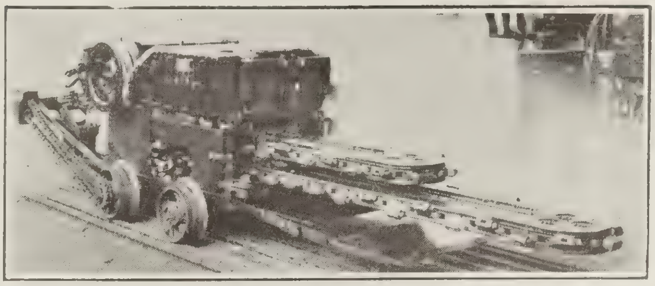

**Fig. 7—Ready for a Move**

The truck and other equipment provided for transporting the snubbing machine is practically identical with that with which the standard undercutter is equipped. The new machine may thus be moved about loaded and unloaded as easily as the machines intended for making ordinary undercuts.

## Wagon Loader Helps Solve Entry Problems Underground

When N. H. McClevey, manager of the Pike County Coal Corp., Petersburg, Ind., decided to speed up entry work in developing territory for his long-face Ace loaders, he purchased an ordinary wagon loader, took it off the regular mounting and mounted it on mine car wheels. The upright frame was pivoted on the base plate of the truck so that this frame can be let down to pass under low places in the mine.

The photograph, from which the accompanying illustration was made, was taken in the coal company's shop at Petersburg, just before the loader was taken into the mine. In actual use the machine has proven to be very satisfactory, loading over 60 tons per shift. In reality the machine is not a loader but is only a conveyor which elevates the coal after it has been shoveled by hand on to the lower end. The entire cost of the unit was not over $700.

**Wagon Loader Goes in Mine**

This outdoor machine was taken off its regular mounting and put on a mine car truck, reducing its headroom requirements. Then it went underground and loaded 60 tons of coal a day in entry work.

## Anthracite Conferees Reach No Agreement on Miners' Wage and Check-off Demands; Parley Runs On

**By Sydney A. Hale**
Special Contributor, *Coal Age*
New York City

Concentration upon the two major planks in the miners' demands—wage increase and check-off—featured the second week's negotiations of the subcommittee of the anthracite operators and miners at the Hotel Traymore, Atlantic City, N. J., July 21-24. The union representatives fought hard to break down the position of the employers that the competitive situation facing hard coal made it impossible to agree to changes in wage rates which would increase the cost of coal to the domestic consumer. Although spokesmen for the operators have conceded the initiative to the Mine Workers by stating that the latter were, in effect, "the plaintiffs" in the negotiations, the union men were on the defensive, seeking to combat the arguments set forth by S. D. Warriner in his reply to the miners' demands made when the scale committee first convened on July 9.

That reply indicated clearly that the operators have in mind a number of counter-demands to present to the miners. They have, however, consistently refused to disclose these demands until the miners have completed the presentation of all the arguments in favor of the program that was framed by the tri-district convention at Scranton the first of July. This does not mean that the operators on the subcommittee have not vigorously answered the contentions made by the spokesmen for the union on that committee; far from it. But they have refused to give a flat acceptance or rejection to any proposition advanced by the miners during the meetings.

### Operators Sidestep Rate Issue

The operators, it is true, have declined to assent to the proposal for a joint petition to the Interstate Commerce Commission to investigate anthracite freight rates. But, aside from the fact that that question is already before the commission, the operators do not feel that it is properly a part of the present negotiations. Their opposition to the check-off also has shown no signs of weakening, so that their position on that question is so well known to the miners that a definite restatement of their attitude would add nothing to the general understanding of the situation. The greater part of the sessions last week were devoted to a discussion of that subject, euphoniously phrased in the miners' demands as "complete recognition" of the union, and it is not a matter of public knowledge that any new arguments were advanced by either side.

Neither side, of course, will make any prediction as to the outcome of the negotiations. It is estimated that it will take another two weeks to complete the presentation of the miners' demands. The operators say that they think they can make their presentation in less time than it has taken their opponents. Spokesmen for both groups express the hope that an agreement will be reached by the present committee, but when Major W. W. Inglis, chairman of the operators' group, asked the miners to eliminate all danger of a suspension on Sept. 1 by joining with the operators in an agreement to continue work after that date, the miners rejected the offer as "premature."

### Discount Bittner Telegrams

Major Inglis' proposal followed the publication of the Van Bittner telegrams to Secretaries Davis and Hoover in which the United Mine Workers' official renewed the threat of a general strike to enforce the Jacksonville agreement. These telegrams were not seriously regarded by observers at Atlantic City, but a statement credited to Mr. Bittner that both anthracite and bituminous workers were included in his threat caused the operators to seek further light. Vice-President Murray of the union disclaimed any intent upon the part of his organization to involve the hard-coal region in the bituminous troubles arising out of the Jacksonville agreement.

In the consideration of the demand for a 10 per cent increase in contract rates and an advance of $1 per day to day men the subcommittee entered into an extended discussion of competition between anthracite and other fuels. The competition between the steam sizes of anthracite and bituminous coal was outlined. Working time and conditions in the soft-coal regions also were touched upon. The miners sought to stress statements made in "The Burning Question" (a monthly bulletin sent by operators to retail distributors) featuring the claims of anthracite as a domestic fuel and the high cost of gas.

Engineers who have looked into the gas question predict growing competition from this source and a material reduction in the cost of gas heating. This prediction is based upon the rapid development of coal-gas manufacture—a development which means the substitution of bituminous coal for anthracite in gas manufacture, as well as a large increase in the tonnage of coke to be marketed through domestic channels—and the work being done in perfecting a combination gas and fuel-oil burner.

In connection with the general discussion on the wage demands there was some argument in the committee on present and past working time in the anthracite regions and the outlook for the future. The miners also sought information as to retrenchment policies evidenced in the closing down of certain collieries and the reasons such action was taken. There also was debate upon the original cost, depletion and present value of the anthracite producing properties. The official communiqués of the week, however, were barren of any suggestion that the miners had offered any economic justification of their demand for higher rates of pay, although Mr. Murray, after the sessions had adjourned over the week-end, promised the press that such an effort would be made.

The subcommittee resumed its sessions on July 28.

### *Americans and British Buy Half of a Stinnes Company*

American and British bankers on July 27 bought a half interest in the Deutsche Luxemburgische Co., one of the largest of the group of Stinnes concerns in Germany, for approximately $4,000,000. This is the first time British and American interests have combined to invest in any German industrials on such a scale as this. The buyers are Dillon, Read & Co., of New York, and J. H. Shroder & Co., of London. The Deutsche Luxemburgische Co. together with the Gelsenkirchen, Bochumerverein and Siemens constitutes the Rhine-Elbe Union, the largest producers of coal, coke, iron and steel in Germany.

# General British Mine Strike May Bring 1,200,000 Men Out July 31 Though Government Is Mediating

Great Britain may experience a general coal-mining strike July 31. Four days before the deadline it appeared possible that the coal-mine operators and the men would continue a joint conference which had begun with a short session on July 24, but there were no indications of results. This conference—the first that had taken place since the operators several days earlier had posted notices at the pitheads all over Great Britain that reduced wages and longer working days would be put into effect Aug. 1—was arranged through government mediation. The mediator was the First Lord of the Admiralty, W. C. Bridgeman. Up to the moment he brought representatives of both sides together neither faction had been willing to grant a single point and each seemed obdurate. Whether the conferences, if they continue up to the night of July 31, will soften the position of either remains to be seen.

Many keen observers in England have been declaring that a general coal strike cannot be avoided. The London *Times* editorially refers to the resumed negotiations as "amiable delusions resting upon vague recollections of former disputes under totally different circumstances." The *Times* says the more the two parties to the dispute get together the less they agree. It holds that the coal industry is sick and that a radical remedy of some sort must be found before labor difficulties can be removed. It warns the English people to awake to this fact. The Archbishop of Canterbury on Sunday issued an appeal to the people of England to pray for guidance that some way may be found to prevent the industrial chaos toward which Great Britain is headed. "Never, so far as I can judge," said he, "has the danger been so grave and so urgent as it is today."

Not only are England's 1,200,000 coal miners on the verge of laying down their tools on the order of the Trades Union Congress, which has the miners' case in its hands, but it is broadly hinted that transportation unions will quit in sympathy. Herbert Smith, president of the Miners' Federation, said that if there was a strike and if German coal began to come in, he "could trust the transport workers" and railwaymen to refuse to handle it. He did not refer to American coal, though inquiry from American shippers was becoming brisk.

In the government's struggle to stave off the mine strike Premier Baldwin agreed to meet the Trades Union Congress special mine committee on the 27th. There was some hope pinned to this meeting. However, the situation seemed to be at deadlock. The nearest thing to negotiation was a proposal made rather indefinitely from the operators' side that wages be adjusted so that allowance be made for the size of a miner's family.

The Miners' Federation has agreed that even if there is a strike, maintenance men shall be left on the job to save the mines from flooding, provided these men receive the present scale of wages no matter how long the strike may last.

---

## Ohio Merger Not Dead Yet

Merger discussion in the eastern Ohio No. 8 field has come to a standstill largely on account of the absence from Ohio of officers of companies whose consolidation has been talked of. Edward Johnson, of the Lorain Coal & Dock Co., Columbus, is in Europe.

The impression got around the coal trade in Cleveland that the merger had been given up or indefinitely postponed, but this is incorrect. The report resulted from the decision on the part of some of the parties to the plan to sell certain properties not needed in the consolidation.

It is expected the project will be taken up in September. Plans call for a $40,000,000 company controlling nearly all the big operations in a field whose business is now principally railroad fueling. The effect of the Interstate Commerce Commission's refusal to alter the freight rates on lake cargo coal is expected, if anything, to increase the sentiment in favor of a merger.

## Ten Dead from Fire and Blast In Tennessee Mine

William J. Snow, superintendent of the Roane Iron Co. coal mines, and nine other men were imprisoned by an explosion in the company's mine at Rockwood, Tenn., early July 23. Two were killed outright by the blast and no hope is held out for the others.

The men had gone into Bryson Dip on the No. 7 entry to combat a fire that broke out some time ago and was walled up in an attempt to extinguish it. The barricade was removed last week in the presence of state and federal mine inspectors, who pronounced conditions satisfactory. At 11 o'clock the old blaze broke out again and a fire-fighting party was organized.

The bodies of Claude Tindell and Raymond Watkins were later brought to the surface. The bodies were horribly mangled and were identified only by their clothing. Another rescue party entered the mine, but hope of finding the other entombed men alive has been abandoned.

The entrance to Bryson's Dip mine of the Roane Iron Co. was sealed July 24 and all efforts to recover the bodies were abandoned until the fire raging in the mine burns itself out. Rescue workers said that the flames may not subside for a month.

---

## Pauley Named President of J. K. Dering Coal Co.

J. B. Pauley, for several years vice-president and operating head of the J. K. Dering Coal Co., of Chicago, has been made president of the company, succeeding the late J. K. Dering. Mr. Pauley also is executor of Mr. Dering's estate. Mr. Pauley has been a rising figure in the coal field of the Middle West ever since he left an important connection with the International Harvester Co. to join Mr. Dering. His dominating strength, keenness, tact and good humor have aided him to become one of the logical leaders among coal operators. He has represented coal operating interests in various capacities, chiefly during negotiations between operators and miners. He is now a director-at-large of the National Coal Association. His company operates both in Indiana and Illinois.

**Tipple Destroyed by Lightning and Fire**

Montour No. 9, of the Pittsburgh Coal Co., two and a half miles northwest of McDonald, Pa., set afire by lightning July 10, causing a loss of about $100,000. The tipple was built in 1917 and was one of the largest in the district, serving two shafts. It was equipped with modern machinery.

## Railroads Put 83,291 Cars in Service in Six Months

The largest number of freight cars on record was placed in service during the first six months this year by Class 1 railroads of this country, according to a report by the Car Service Division of the American Railway Association.

The total number installed during the first half of this year was 83,291, exceeding by 12,417 the number placed in service during the first six months last year and by 4,051 the number placed in service during the first six months in 1923.

Box cars placed in service during the six months period totaled 43,627, an increase of 12,191 over the number installed during the same period last year and 10,541 in excess of the same period in 1923. Coal cars placed in service this year numbered 29,504, an increase of 7,029 above last year but 2,240 below two years ago.

Freight cars on order on July 1, 1925, totaled only 28,197 compared with 60,315 on July 1, 1924, and 96,855 on July 1, 1923.

Class 1 railroads during the first half of 1925 placed in service 927 steam locomotives compared with 1,071 during the same period last year and 1,998 during the same period in 1923. The same roads on July 1, 1925, had 279 locomotives on order compared with 360 on the same day last year and 1,902 two years ago.

These figures as to cars and locomotives include new, rebuilt and leased equipment.

The average capacity of the freight cars owned by the Class 1 railroads on July 1 this year was 44.56 tons compared with 43.88 tons on the same date last year, or an increase of 1.5 per cent.

---

A. B. Lewis, state director of the Department of Mines and Minerals of Illinois, has announced the August itinerary of the Illinois Miners' Examining Board as follows: Aug. 3, Collinsville; Aug. 4, Harrisburg; Aug. 5, Herrin; Aug. 6, Marion; Aug. 7, West Frankfort; Aug. 8, Duquoin; Aug. 10, Staunton; Aug. 11, Springfield; Aug. 12, Taylorville; Aug. 13, Danville; Aug. 14, La Salle; and Aug. 15, Peoria.

*Keystone View Co.*

**Lady Rhondda**

Addressing the first conference of women in science and commerce at Wembley, England, Lady Rhondda pleaded for fathers to take their daughters into partnership. There should be more names reading "John Brown & Daughters" instead of "John Brown & Sons." Lady Rhondda herself was trained in business by her father, one of the richest coal operators in Wales, and she is a director in many companies.

## N. & W. Orders 1,000 Coal Cars

The Norfolk & Western Ry. has ordered 1,000 hopper coal cars from the Ralston Steel Car Co. and is understood to be buying 30 tender engines from Baldwin Locomotive Works. The Richmond, Fredericksburg & Potomac also has ordered two mountain type and two switching engines from the American Locomotive Co.

---

Plans of C. P. White, chief of the Coal Division, Department of Commerce, and secretary of the Advisory Committee of the Bureau of Mines, call for a meeting the latter part of this week of the Advisory Committee. Not more than four of the seven members are expected at this meeting, which will be preliminary to a meeting of the full committee to be held about ten days later, at which Secretary Hoover, who will return from California the first week of August, will be present.

## Industrial Coal Stocks Gain Slightly

Coal stocks on hand in industry July 1 are estimated by the National Association of Purchasing Agents at 39,432,000 tons, sufficient for forty-one days' supply based on the amount consumed daily during June. The June 1 estimate of stocks was 39,317,000 tons.

A survey throughout the United States and Canada shows that 18 per cent of industrial consumers carried about the same amount of coal on hand July 1 as on June 1; 37 per cent had more on hand and 45 per cent had less. Those carrying more coal than on the first of the previous month did not have abnormally large stocks on hand, showing that the increase was due simply to a normal replenishment of used stock.

It is estimated that 28,050,000 tons of coal were used in industry during June. This figure does not include any coal used for heating buildings. This is about one and a half million tons less than May consumption. The difference in daily consumption was only 10,000 tons less for June, however, as May contained 31 days. About 2,000,000 tons less coal was used in June, 1925, than during June, 1924, a decrease of 7 per cent.

## U. P. Old Timers Organize

Nearly three hundred employees of the Union Pacific Coal Co. who have been in the service of the company from twenty to forty years have formed an organization known as the "Old Timers." The organization meeting, at Rock Springs, Wyo., late in June, was featured by a musical program, recitations and a banquet with speeches by notables, George B. Pryde, vice-president and general manager of the company, acting as toastmaster.

The climax of the affair came when Eugene McAuliffe, president of the company, expressed his appreciation of the long and faithful service of the men in the new organization and presented gold buttons to twenty-one men who have been in the company's employ forty years or more. Three of the latter are Chinese.

† Coal loaded into vessels in December, 1924, after close of navigation and forwarded from Lake Erie ports during 1925.

‡ Includes 5,142 tons cargo, 56 tons fuel diverted from Lorain, B. & O.

** Includes 27,868 tons cargo, 1,697 tons fuel dumped at Huron on account of fire at Lorain, June 12, 1925; also 3,631 tons fuel dumped over ore dock at Lorain.

Compiled by Ore & Coal Exchange, Cleveland, Ohio; H. M. Griggs, manager.

# Anthracite Shortage Unlikely Even If Miners Strike, Washington View; Soft-Coal Threat Not Taken Seriously

**By Paul Wooton**

Washington Correspondent of *Coal Age*

Observers of the coal situation with headquarters in Washington are at a loss to understand articles in the daily press intimating that a severe shortage of coal would follow promptly on the heels of an anthracite strike. The opinion of specialists both inside and out of the government service is to the effect that any such a shortage is highly unlikely. While stocks on June 1, when regarded generally, were no more than normal, the probabilities are that they will be built up rapidly before the end of the anthracite agreement. The time is ample to provide a comfortable reserve against a possible shutdown.

The stocks of bituminous coal on June 1, according to the recent report of the U. S. Geological Survey, aggregated 38,000,000 tons. During the time which will have elapsed by Sept. 1 consumers easily could add 2,000,000 tons a week to their stockpiles without straining either the productive capacity of the mines or the carrying capacity of the railroads.

Few of the Washington observers expect the threatened strike in the bituminous mines to materialize. They realize that there are some operators in both the union and non-union camps who would welcome a strike, but the belief is that the great majority of them feel that it would be a great calamity. The sacrifices made to deflate the industry under the Jacksonville agreement would be in vain if a period of high prices should ensue. The thousands of mines now closed would spring back to life. At the end of its debauch the industry would awake with more excess capacity than ever.

### Strike Might Save Lost Cause

It also is appreciated that some of the leaders among the mine workers would welcome a strike as the only way out of an impossible situation, which otherwise spells defeat and ruin for their personal fortunes. Here also wiser counsel is likely to prevail, it is believed. The leaders must take into account the heavy losses which their ranks have suffered. Practically 70 per cent of the current output of coal now is being furnished by non-union workers, as compared with 40 per cent two years ago. The situation in northern West Virginia is typical of union loss of ground. A coal miner from that section says:

"None of the coal in northern West Virginia which ordinarily is referred to as union tonnage is produced in strict compliance with the terms of the Jacksonville agreement. Modifications permit that coal to be produced at a cost much lower than would be possible were the agreement followed exactly. It permits the so-called union mines to compete with non-union operations in that part of the state. They are thirteen in number with a total output of 200 railroad cars per day, which is 12 per cent of northern West Virginia's current production."

To provoke a strike under such conditions obviously would benefit chiefly the non-union operations. The expanded non-union area can produce more than the railroads can haul away. The railroad capacity is 8,000,000 tons a week—enough to keep the country going for a long time. A bituminous strike, all agree, would be the signal for the signing of many new contracts with non-union shippers.

Had it not been for the experience in 1922, when such strong non-union centers as Somerset, Cumberland and Westmoreland were closed, as much to the surprise of the United Mine Workers as to the employers, no one would consider the possibility of non-union men going out this year. The knowledge of the great depression in union fields will be a restraining influence on the non-union miners who might otherwise join in the movement.

### Hard-Coal Stocks for 52 Days

Even in the matter of anthracite supplies are ample for some time. The stock report shows fifty-two days' supply on hand. This does not include stocks in the bins of the ultimate consumer. While few householders buy winter fuel before June 1, the surplus from the preceding winter makes a sizable aggregate. It is admitted, however, that rationing of anthracite would have to begin before the winter was over. The experience of 1922 and 1923 furnishes a yardstick. At that time a five months' strike caused a 40-per cent shortage. While stocks probably are no larger now than then, a large number of consumers have been educated to use substitutes. New England, by reason of experience in the previous strike, has learned that coal can be landed in an emergency in considerable amounts at most of its smaller ports. For these reasons it is believed that a longer suspension would be necessary to bring New England to the point that it was at the end of the last strike.

---

Bituminous coal mines in 1924 used 165,543,000 lb. of all classes of explosives, states W. W. Adams, statistician, Bureau of Mines. This quantity represented 342 lb. of explosives for each thousand tons of coal produced. Of the 342 lb. of explosives, 73 lb. was permissibles, 20 lb. was other high explosives, and 249 lb. was black powder. Permissibles, therefore, constituted about 20 per cent of the total quantity of all explosives used in mining bituminous coal. In 1917 permissibles formed only 11 per cent of the total quantity of explosives used.

---

## *Pittsburgh Coal Co. to Centralize Four Mines*

Pittsburgh, Pa., July 28.—The Pittsburgh Coal Co., it was learned today, has started work on centralization of four of its mines at an approximate cost of $600,000. The mines are the Warden, located in Douglas Hollow, near Douglas station on the Pittsburgh, McKeesport & Youghiogheny branch of the Pittsburgh & Lake Erie R.R.; Ocean No. 2, Lovedale and Forest Hill mines. The last three, it was said, will be connected by tunnels with the Warden Mine, at which a steel tipple will be constructed. In this way all coal taken from the four mines can be loaded on cars at the mouth of the Warden Mine.

Construction work has been started at the entrance of the Warden mine. The project includes the construction of a concrete wall and the laying of a railroad spur through Douglas Hollow from the mine to the Pittsburgh, McKeesport & Youghiogheny branch.

Of the total amount of money appropriated for the work, it was said, $200,000 will be for mine cars.

There is no expectation, company officials said, of opening the mines by Nov. 1, as reported in the press.

## Lake Cargo Rates to Stand

There will be no change in bituminous lake cargo rates to Lake Erie ports this season.

The Interstate Commerce Commission, in a decision by Commissioner Hall, has dismissed the complaints of the operators associations of Ohio, Pittsburgh and the Fairmont district seeking reductions in transportation charges and a widening in the spread in the differentials between the rates from those fields and the charges in effect from southern West Virginia and Kentucky. In taking this action, the commission reversed the report of its examiners, whose tentative opinion (*Coal Age*, March 12, p. 403) was, on the whole, favorable to the contentions of the complainants.

The decision of the commission reiterates, as in the Boileau case, that cost is not the only factor to be considered. Taking all the elements into account, it finds that the existing basis is neither unreasonable nor unduly prejudicial. It points out that the rates from the Southern fields, which formed the gravamen of the complaints in these proceedings, are made by carriers who have no voice in the making of rates from Ohio and western Pennsylvania, so that a finding of unjust discrimination cannot lie. While the minimum rate powers of the commission were invoked, the federal tribunal declined to exercise them. Such powers, it declares, must be used sparingly.

Commissioners Eastman, Lewis and McManamy dissented to the majority decision. Commissioner McChord filed a brief opinion repeating his conviction, expressed in the Ohio-Michigan Coal cases, that Ohio and Pittsburgh rates are still out of line.

# Open-Shop and Union Mines Resume In West Virginia Strike Zone

More mines resumed operation in the West Virginia strike region recently. The Consolidation Coal Co. reopened New England mine, at Watson, near Fairmont. This is one of the older and best known operations of the company and produces thirty cars of coal daily under normal conditions. No difficulty is being encountered in obtaining men for work at the mine, it is reported. With the resumption of work on the 1917 wage scale the New England mine is the most picketed mine in the region at present. Every morning from 300 to 600 pickets, including women and children, are appearing on the picket line, urging miners not to return to work.

The work of cleaning up Riverdale mine of the Consolidation Coal Co. was under way last week and coal will be loaded there soon. The mine has been idle 1½ years.

Rosedale mine No. 2 of the Rosedale Coal Co., at Poland, Pa., resumed work on a non-union basis last week. The tipple of this plant was burned down several weeks ago.

### Two Mines Start Union

Davis & Gilbert Coal Co. mines Nos. 1 and 2, in Scott's Run, resumed operation on a union basis July 23, according to officials of the United Mine Workers. Efforts to work there previously resulted in a disagreement and the union withdrew the men. The mines, it is reported, will employ 450 men. A day shift will be worked at mine No. 1 and a night shift at No. 2, according to reports. The company recently completed a modern tipple at its plants.

Miners employed by the Consolidation Coal Co. under the so-called company contract plan held a meeting in Shinnston on Thursday night of last week, when great satisfaction was expressed over the progress of the new labor organization in this field, according to reports. The plan now is to start a district organization among the miners employed by the company, it is announced, and another meeting has been called for this week to perfect the organization. Grievances were presented and disposed of and minor difficulties were settled, according to press reports. The men are well satisfied with the check weighman plan as used by the company union and it is said that this will be one of the more important features of the big union. John B. Wyatt of Shinnston, counsel for the miners working at company contract mines, has been retained for the big union.

Alleging that he was attacked and beaten up by men carrying out the order of J. W. Devison, of Grant Town, general superintendent, and other officials of the New England Fuel & Transportation Co., Daniel Cronin, Jr., has brought suit through his attorneys in the sum of $25,000, with attachment proceedings, against that concern.

The United Mine Workers continues to hold miners' mass meetings in the field. Meetings were held last week at Everson, Zeizing, Downs, Kingmont and Monongah. Week-end meetings were arranged for Carolina, Barrackville and Laura Lee.

A blast of dynamite which exploded in the early morning of Wednesday, July 22, caused reports to be circulated that depredations were being committed in the region. The charge was set off by Baltimore & Ohio employees, to dislodge accumulations of tar and débris which clogged up a culvert near Fairmont, causing the water that was dammed to wash out a portion of the roadbed. All traffic was tied up 11 hours and the coal movement to the east on both the M. R. branch to Clarksburg and the main line to Grafton was cut off.

Officials of the United Mine Workers issued a statement last week in which they alleged that the non-union coal operators were padding their production reports for the purpose of weakening the morale of the union miners. The statement set forth also that merchants in northern West Virginia realized that the state of business did not lead them to believe that the coal production had reached such dizzy heights as claimed.

Patrick Buckley, president of local union No. 1,643, of Monongah, the largest local union of the United Mine Workers in the region, issued a statement last week in which he asserted that only twelve members had deserted the ranks to work non-union at the New England mine at Watson, and these men, according to Buckley, had gone back to work on the 1917 wage scale at Scott Mine of the Bethlehem Coal Co. prior to this.

### Lull in Panhandle Region

The Panhandle strike has quieted down again. A temporary injunction was granted by Judge J. B. Sommerville of the Circuit Court in behalf of the Pittsburgh, Virginia & Kentucky Coal Co. of Wellsburg, Brooke County, against John L. Lewis, Philip Murray, William Roy, Frank Ledvinka, Lee Hall, Joseph Angelio and 50 other members of the United Mine Workers, prohibiting them from picketing, intimidating employees or in any way intefering with the operation of the company's mines. According to last reports the union officials are making preparations to take an appeal from the decision of the court.

Threat of a general strike in the anthracite and bituminous coal fields in a telegram to the government by Van A. Bittner, West Virginia international representative of the United Mine Workers, who was in Atlantic City, attending the anthracite wage conference last week, caused a mild stir. Much of the sting was removed, however, when hard-coal miners expressed the belief that each industry must stand on its own feet and that the hard-coal fields could not be depended upon in the proposed strike plans.

Deputy sheriffs arrested twelve union men at the New England mine of the Consolidation Coal Co. on July 24, on charges of being disorderly incident to picketing at the plant. Each man was held under $200 bond for a hearing before a magistrate in Fairmont.

Operations in Northern West Virginia produced 5,571 cars of coal in the first four days of last week. Union mines had an output of 856 cars. A new daily peak for non-union coal production was reached July 22, when 1,427 cars, were loaded. Production continues heavy on the Monongah Division, B. & O., where a new daily loading level was reached July 22, when 726 cars were produced. Non-union production continues heavy along the Monongahela Ry.

## *Smelter Shifts to Coal*

The Phelps Dodge Co. will spend approximately $100,000 within the next few months in remodeling its furnaces at the Clifton (Ariz.) smelter to use pulverized coal instead of oil, according to a recent statement by J. P. Hodgson, general manager. The company believes that a material saving can be effected by the change. The equipment to be installed will include a coal pulverizer. Coal from the Phelps-Dodge mines at Dawson will be used by the Clifton smelter and will be prepared for use here exactly as it comes from the mine.

---

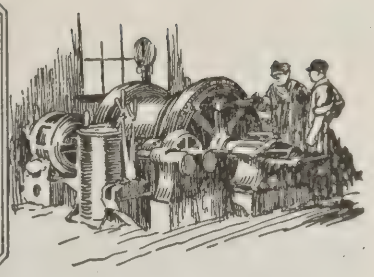
## Drop Injunction Proceedings

Injunction proceedings to prevent directors of the Harmon Creek Coal Co. from extending the lien on a $1,500,000 mortgage, executed in August, 1917, to cover additional properties have been dropped upon the agreement of the majority of the directors that such extension would not be made. A temporary restraining order against H. F. Sinclair, of New York, and J. T. M. Stoneroad, George H. Flinn, R. B. Haverstick and B. H. Jones, of Pittsburgh, had been issued by the Court of Common Pleas at Pittsburgh, Pa., last Friday (July 24) on petition of the Creditors' Committee of the Carnegie Trust Co. The committee charged that the proposal to extend the lien was a conspiracy to deprive creditors of their equity in coal lands sold to the Harmon company by John A. Bell but not completely paid for. A statement issued by Mr. Flinn declared that he and Mr. Sinclair had disposed of their interest in the coal company to Mr. Bell over four years ago and had received mortgage bonds in payment.

---

The Great Valley Anthracite Mines, Inc., which holds leases on 371 acres of coal land at McCoy, Va., on the Virginian Ry. and facing the New River is offering for sale through the Union Trust Co. of Maryland, Baltimore, Md., half of an authorized issue of $500,000 general-mortgage 7-per cent sinking-fund gold bonds. This company recently entered the property and now has a 30-deg. slope down 900 ft. in what is said to be "tough coal over 8 ft. thick."

# Practical Pointers For Electrical And Mechanical Men



## Inexpensive Filter Device Prevents Clogging of Water Mains

Many mining operations and camps experience considerable difficulty in keeping their water mains and pipe lines free from a deposit that eventually will obstruct the water passage and thus prevent a free flow of water. Frequently, this deposit is the result of a certain reaction between calcium or other members of the alkaline earths when they come in contact with the iron in the pipe. Such conditions usually necessitate the digging up of the old line and replacing it with new pipe. This operation is sometimes difficult and is always expensive.

The purpose of this article is to tell the maintenance engineer of a cheap device that has proven efficient. However, the reader must bear in mind that such an arrangement is not suitable for a water softener but is merely intended to prevent the obstruction of water lines.

### MATERIAL EASY TO OBTAIN

The material required for such a device or trap, over and above the equipment already employed in the water system, may be listed as follows: One length of 10- or 12-in. iron pipe about 10 ft. in length, a flange coupling fitted to each end of this pipe, two end plates drilled to correspond with the bolt holes in the flange couplings and one hole drilled and tapped in the center of each plate to accommodate the water main; also an ample supply of ordinary coarse slag. The material listed above usually can be found somewhere about any property. Hence the material cost is lowered to a minimum. As for the slag, after it has been polluted with the deposit it may still be used for roadbeds and many other purposes. Although, I cannot recommend it for any kind of cementing project.

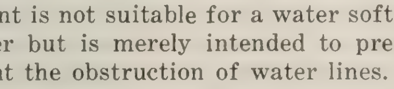


**Fig. 1—Chamber for Slag**

The water which is passed through this pipe comes in contact with materials which take the impurities out of solution.

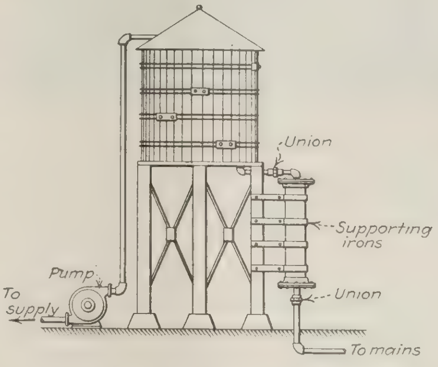

**Fig. 2—How the Filter Is Connected Into the Water System**

Note the filter is connected to the discharge piping of the tank. Here the water travels slower and provides more time for the separation of the impurities from the water.

Fig. 1 shows the assembly of the materials listed above. Now let us make a mental picture of this iron pipe or cylinder, as shown in Fig. 1, full of coarse slag which is porous and rough, ready to collect any solid matter that might pass its way, and connected in series with a water supply system, as shown in Fig. 2; then, we have a clear understanding of the principle on which it operates.

### CONNECT FILTER IN SERIES

It is preferable that this filtering device be connected in series with the discharge line rather than between the pump and the tank, due to the fact that the water usually does not pass out of the tank with as great pressure and speed as it is forced into the tank. Therefore, the slag is given more time in which to collect the sediment and little of it is likely to pass on into the pipe lines.

It is desirable that the cylinder be supported from the tank in a perpendicular position, thus leaving the end plates free for removal when changing the slag. The end plates should be connected to the line by means of pipe nipples and unions so that they may be removed easily. However, when the cylinder stands in an upright position it will be necessary to cover the lower opening with a screen of small mesh to prevent the slag from passing on into the outlet pipe.

The removal and renewal of slag in the cylinder can only be determined through careful observation and experience, as it is obvious this requirement will be governed wholly by the amount of slag employed, the volume of water passing through the cylinder and the amount of solid substance that the water may contain.

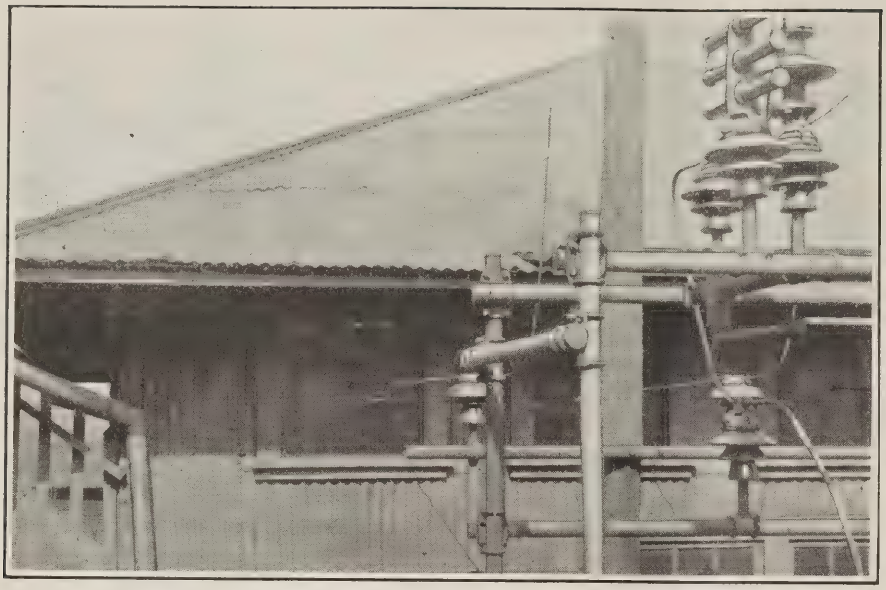
R. L. GRIMES.

## Plate Glass Windows Serve As Wall Bushings

The insulation of high voltage wires at the point where they enter a building is more important when the walls are of wood or metal than when they are of brick or stone. The latter are in themselves fairly good insulators and are not combustible. With a wood or metal-covered building lack of proper insulation may be the cause of a short-circuit or a fire or both. An entrance of rather unusual type is used at the Wayland, Ky., substation of the Elkhorn Coal Corporation.

Here the three-phase 40,000-volt line is brought in through panes of glass rather than through the usual porcelain wall bushings. A 26- x 26-in. single-pane, ¼-in. plate-glass window is provided for each of the three wires. The conductors, which are of solid copper, enter the substation through small holes drilled in the centers of the panes. The three windows are located close to the roof and are protected in a measure from the weather by broad overhanging eaves.

This installation, which no doubt cost less than if porcelain wall bushings had been used, has demonstrated its worth by 12 years of service. It is interesting to note that the leak-



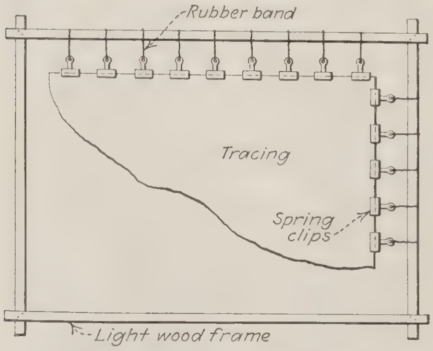
Each Wire Is Carried in Through a Hole in the Glass

Are the windows used as wall bushings or are the wall bushings used as windows? In this case the three upper windows were installed primarily as wall bushings, therefore the light admitted was merely a secondary result. These 40,000-volt entrances which are of $\frac{1}{4}$-in. plate glass have demonstrated their worth by many years of satisfactory service.

age surface on the 40,000-volt plate-glass insulators is 13 in. as compared to 19 in. on present-day porcelain wall bushings rated for use on lines operating at 60,000 volts. In these two cases the length of the leakage path, commonly spoken of as the leakage surface, is practically proportional to the line voltage.

## Home-Made Frame Restores Water-Soaked Drawings

A way to flatten tracings which have been wrinkled and bulged from contact with water is suggested by H. N. Clendening, West Virginia Coal & Coke Co., Logan, W. Va. Several years ago, after a fire he had on his hands a number of tracings which, from severe wetting, resembled bedraggled rags. But the lines, letters and figures on these sheets were still legible, which led him to search for a method to restore the tracings and save the cost of re-inking or perhaps even laying out anew maps from stale notes.



This Frame Is Easily Made

The proper tension around the edges of the drying sheet is maintained by twisted rubber bands to which each clamp is attached.

He hit upon a process which gave satisfactory results. First of all the tracings on the wrong or under side are moistened with a sponge. Then each is stretched on a frame, being held by compression spring clips, arranged at close enough intervals to insure a fairly even stretch on all parts of the cloth, in somewhat the manner of squaring up a house curtain on a stretcher frame. Rubber bands may be utilized to keep the cloth taut, these being tied to the clips on one end and to the frame on the other. The scheme is shown in the accompanying illustration.

Care should be taken to provide uniform tension at all points of suspension so as not to distort the drawing; and only sufficient tension should be provided to take out the wrinkles and bulges. Too great a tension will stretch the drawing excessively out of scale. After the cloth has dried it is well to draw in the indistinct lines and lettering, after which the cloth should be coated with a flexible and transparent water-proofing fluid or varnish. The same general process can be applied to water-soaked drawings on rather heavy paper stock.

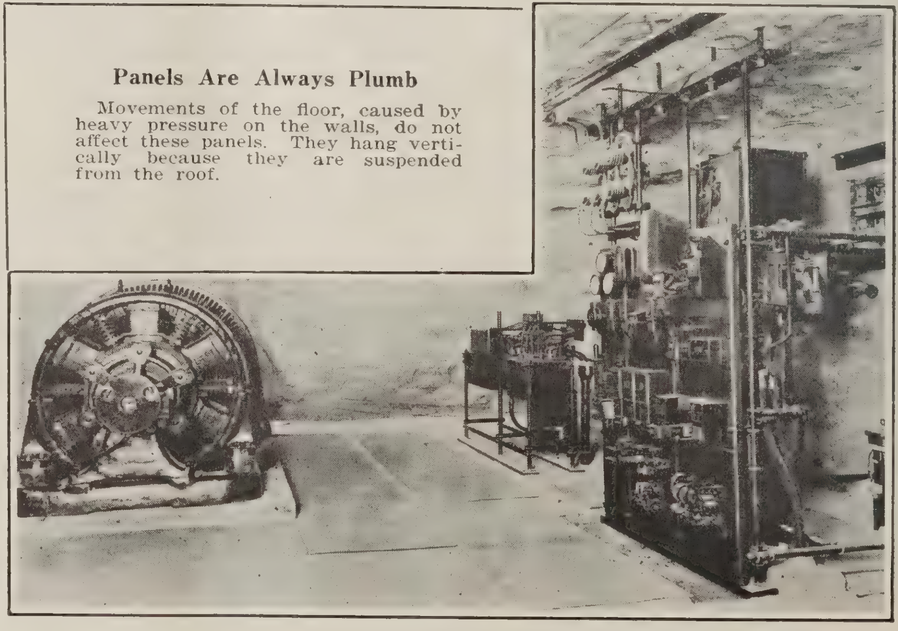
The accuracy of the finished job depends upon the degree of care taken. The lines are bound to be at least slightly distorted and more or less out of scale, but on the whole the drawings will serve their purpose for, after all, what drawing can be scaled accurately to a hair?

## Panels Suspended from Mine Roof Hang Vertically

Some coal mine electrical man may get a helpful idea from the accompanying photograph. It shows a substation in a salt mine. The overhead pressure on the pillars around the substation room was so great that the floor tended to bulge. This unusual condition was met by supporting the automatic substation control panels from the roof.

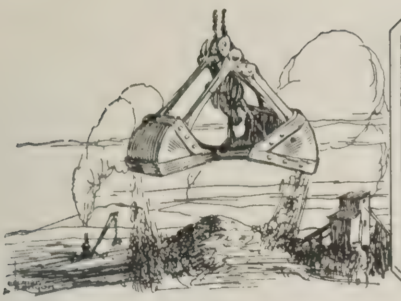
Holes were drilled in the roof of the mine chamber and hangers similar to those used for suspending trolley wires were utilized. By this means the control panels hang in a vertical position. Because the switching equipment provides automatic control it was essential that the panels be plumb at all times.

The motor-generator set was mounted on a massive block of concrete in no way attached to the side walls.



Panels Are Always Plumb

Movements of the floor, caused by heavy pressure on the walls, do not affect these panels. They hang vertically because they are suspended from the roof.



# Production And the Market

## Sentiment Improves in Soft-Coal Market; Anthracite Trade Gains Steadily

Sentiment in the soft-coal trade continues to improve gradually but steadily. Demand is picking up and inquiries are increasing, and the market is better off for the fact that there is nothing of the spectacular in developments. If producers continue to adhere to the present conservative volume of output there is every reason to believe that better things are in store for the trade. As usual, some elements in the business are speculating on the possibilities in the event of a hard-coal strike, but with the railroads giving excellent service there is little likelihood of a runaway market

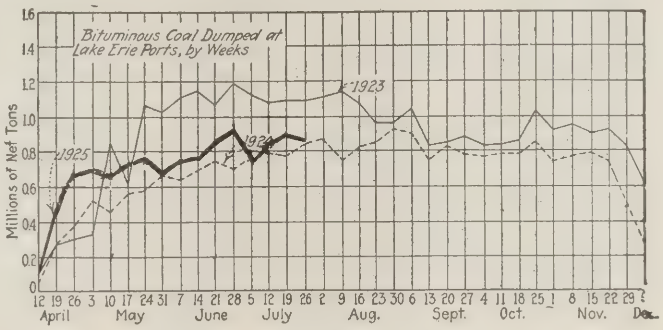
The Midwest market exhibits further strength due partly to increasing retail demand for domestic sizes based on strike talk. Steam coals are quiet, demand being spotty. In Kentucky increasing industrial and domestic demand has brought about a generally improved spirit. Screenings prices in western Kentucky have weakened further, however. The situation at the head of the lakes is disappointing—some inquiries are afloat, but orders are scarce. The docks are heavily stocked, but prices hold firm. Conditions have changed little during the week in Utah, Colorado, Kansas and the Southwest.

Outwardly the Cincinnati market is calm with virtually no change in prices, but a report that part of a big lake contract went to Kentucky and West Virginia producers at 10c. to 15c. under the spot market served to dampen optimism and the hope of better prices. A slight upward tendency is in evidence in southern and eastern Ohio. Apathy still reigns in the Pittsburgh market. The recent betterment in New England, New York and the other Eastern markets continues.

### Hard-Coal Trade Gains Strength

Increasing strength characterizes the anthracite market, stimulated by news of the wage negotiations and the possibility of a suspension. Better demand has stiffened independent prices, but in no case has the advance been extreme. Stove and egg are most active, pea also is moving well, but chestnut is rather slow. Steam sizes likewise are in better demand, buckwheat being perhaps the least active.

Bituminous coal output in the week ended July 18 is estimated by the Geological Survey at 8,972,000 net tons, compared with 8,640,000 tons in the previous week, as shown by revised figures. Anthracite production in the week ended July 18 totaled 1,985,000 net tons, compared with 1,854,000 tons in the preceding week



*Coal Age* Index of spot prices of bituminous coal made a fractional advance during the past week, standing on July 27 at slightly above 160, the corresponding price being $1.94.

Dumpings at Lake Erie ports during the week ended July 26, according to the Ore & Coal Exchange, were: Cargo, 798,567 net tons; steamship fuel, 47,139 tons—a total of 845,706 net tons, compared with 881,383 tons in the preceding week. Hampton Roads dumpings in the week ended July 23 totaled 408,064 net tons, compared with 351,037 tons in the previous week.

(*a*) Revised since last report. (*b*) Subject to revision. (*c*) Minus two days' production to equalize number of days in the two years.

### Midwest Market Gains Strength

The Chicago market is a shade stronger than it was last week. Operators in Illinois as well as in Indiana report a fair volume of business booked from their retail trade. This betterment in current demand is directly due to strike talk, a little demand from the farmers for threshing coal and a number of small orders from school boards for winter coal. Retail dealers are a little more optimistic with this awakening of interest.

Mail-order competition has not cut into the retail trade to any great extent as yet. One of the progressive Illinois operators has circularized his retail dealers with printed matter similar to the mail-order "ads" and has quoted prices which will enable them to compete with the mail-order firms at their own game.

The steam market is quiet, demand being spotty. Some operators are able to maintain prices on screenings and are refraining from forcing sales. Not much steam is being shipped to Chicago on consignment.

Anthracite is moving in good volume, companies reporting heavy bookings for early August shipment. Smokeless coals are strong at $3 for prepared sizes and $2 for mine-run. Some operators have even withdrawn prices until further notice and are taking business only on the basis of quotations current at the time of shipment. Orders for Kentucky block coal eased a little last week, and prices for 4 in. now vary from $2.30 to $2.65, as against a minimum of $2.45 last week.

Domestic business shows considerable improvement in the Williamson and Franklin County fields in some spots and at some mines. This will likely continue to show improvement from now on, but steam is not as active as it has been. Railroad tonnage is fairly good at both shaft and strip mines. Shaft mines are getting two and three days a week, with the usual exception, while strip mines are working practically full time. Some mines continue to crush coal. Prices are unchanged.

In the Duquoin field there is practically no change since last week. In the Mt. Olive field conditions are unusually quiet, the only activity being a little steam, and the mines are still crushing for their steam contracts. In the Standard field coal is selling at about cost. There are no improvements here and conditions are unusually bad. Even steam sizes are lagging and all mines have "no bill" coal on track. Working time is from one to two and three days a week, depending on railroad and steam contracts. Railroad tonnage is light. No change in prices.

At St. Louis there is a little summer activity in the storage of coal, principally of high-grade Illinois. Anthracite, smokeless and coke continue slow and there is very little demand for Mt. Olive, but some summer apartment

**Coal Age Index of Spot Prices of Bituminous Coal F.O.B. Mines**

| | 1925 | | | 1924 |
|---|---|---|---|---|
| | July 27 | July 20 | July 13 | July 28 |
| Index | 160 | 160 | 160 | 163 |
| Weighted average price | $1.94 | $1.93 | $1.93 | $1.98 |

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States, weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and, second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke; 1913-1918," published by the Geological Survey and the War Industries Board.

and school Standard coal is being put in. Local wagonload steam is unusually easy and carload is slowing up. Country steam is quiet and country domestic begins to show activity on different grades in different sections. A good tonnage of western Kentucky seems to be moving into the St. Louis territory, while in Illinois, eastern Kentucky seems to be moving fairly well.

### Outlook Brighter in Kentucky

The Kentucky situation is gradually improving and the outlook is much better than it has been, more confidence being shown and a generally improved spirit in the trade. Industrial, utility and railroad consumption continue active. Movement of fuel to retailers and domestic consumers also is more active in many sections. Lake movement has been very good, and with $1 the minimum on screenings, block selling up to $2.50 and special coals higher, the field on a non-union production basis eastern Kentucky has a very fair business.

Western Kentucky has no accumulation of "no bills" but operators reduced screenings prices and are now getting 80@95c., when they might just as well be getting $1 a ton or better. Block coal, which was at a maximum of $1.50 in early July, has advanced to $1.85 as a maximum and $1.60 as low. Egg and lump are $1.50@$1.60. Mine-run is very low at $1.10@$1.25.

Generally speaking, however, prices are better, and movement much better. Reports are being received from eastern Kentucky stating that some mines which have been down on account of poor prices and weak markets have secured new business at better prices and have resumed operations. In western Kentucky some mines are now up to four days a week or better, whereas not long ago not many mines were working more than two days, except where large companies closed down some of their mines and ran the remaining ones full time.

### Northwest Finds Orders Scarce

Trade remains slow at Duluth, anthracite being practically at a standstill and bituminous showing signs of life as far as inquiries are concerned, but with a deplorable lack of orders.

Strike threats do not worry anyone in either hard or soft coal. The docks are so full that a stopping of shipments might come as a relief.

Dock men evidently expect to sell all the coal that they bring up as prices are holding firm throughout the lists in both hard and soft. In the recent opening of bids for school coal Youghiogheny screenings were bid at $5.10 delivered, which is $1.10 above dock; run of pile was offered at $6.25, anthracite dust at $4.85 and Pocahontas at about the dock price plus cartage. All the dock companies bid the same and the business will be divided among them. Ford bid 20 to 30c. higher than the docks.

Outside towns are expected to ask bids soon for winter coal.

It is reported that 15,000 tons of bituminous coal a day have been landed during the past month at Two Harbors by the Duluth & Iron Range Ry. It is thought that the railroad will sell this coal to employees, use some on the railroad, and consume the balance at the mines on the iron range.

Last week forty-eight cargoes of coal were brought into the port, of which nine were hard coal, and thirteen were reported on the way from lower lake ports—all bituminous. The anthracite situation is getting serious, with storage space becoming limited. It is reported that two docks had to pay demurrage charges on anthracite shipments last week because unable to handle ships when they arrived.

It is estimated that there are 575,000 tons of hard coal on the docks and 3,700,000 tons of soft coal. This is a large stock for this time of the year.

The coal trade in Milwaukee apparently is reaching the end of the annual period of summer dullness. Dock managers report a stronger and steadier outflow of coal to consumers and are looking forward to better demand between now and the winter of 1925-26. Thus far Milwaukee has received more coal by cargo than during the season of 1924. Receipts up to and including July 23 this year total 1,453,469 tons—372,855 tons of anthracite and 1,080,614 tons of bituminous coal. Last year the receipts to the same date totaled 1,191,556 tons—347,238 tons of anthracite and 844,318 tons of bituminous coal.

### Southwest Sticks to Old Groove

Conditions have changed but little in the Southwest since last week. The threshing demand, a small factor at best, is about ended, but dealers still are buying in small quantities. Kansas production is about as it has been for the last two months. Production in the Henryetta (Okla.) field is more or less stable under the 1917 scale and under protection of the national guard. The McAlester (Okla.) district is more free from opposition to the lower scale. In the last two weeks two Puterbaugh mines have been opened in Arkansas under the 1917 scale, one near Greenwood with forty-eight men, and one near Russelville, with twenty.

Colorado reports a slight improvement in the orders for domestic lump and nut coal, but no change in steam coal. Operators expect to increase production the latter part of this month in anticipation of the cut in freight rates to Missouri River territory. Aug. 1 prices on Walsenburg-Canon City coal are: Domestic lump, $5.25; nut, $4.50; washed pea, $3; semi-coking 8-in. lump, $4.85; nut, $3.75; pea, $3; Segundo Salamander coke, $7.50; Segundo nut, $6; Crested Butte-Elk Mountain Nos. 1 and 2 (furnace size) anthracite, $7; Nos. 3 and 5 (base burner size), $7.50; Horace anthracite Nos. 1 and 2 (furnace size), $8.75.

Utah dealers report storage orders as coming in faster than they were, but they say the storage business is below normal for the time of year. Furnace lump is in greatest demand for storage, with nut leading for immediate consumption. A heat wave such as Utah has rarely seen before has hurt the trade. One of the largest producers with headquarters in Salt Lake City reports its best business coming from California now. There seems little doubt that the price of coal will be higher in Salt Lake City this fall.

The best industrial buyers now are the metal mines and smelters and the cement plants, and they are taking slack, dust and coke. Railroads seem to be buying a little, but only for immediate consumption. Here and there an order is being received from the sugar companies for storage purposes. Although the sugar beet acreage this year is well behind that of 1924, present crop estimates place the tonnage as considerably larger than a year ago and the sugar companies will buy more coal than was generally anticipated.

A few coal contracts are being advertised, but there is no big contract business at this time.

### Cincinnati Outwardly Calm

Cincinnati was surprised to hear that part of a large contract for the head of the lakes was alloted to Kentucky and West Virginia producers at from 10c. to 15c. under the spot market for lump, egg and 2-in. This tended to put a damper on optimistic talk and to the hopeful price current that had been backtracking the anthracite wage conference.

High-volatile people had a good place to fall back on in stiffer prices on slack and mine-run and a better situation at tide, which allowed them to put coal there instead of forcing the inland market. In spite of seeming opposing forces, the market maintains outward calm. There has been virtually no change in prices.

The smokeless market still seems to be feeling its way. With August at hand standard producers say they are inclined to hold the figures "as they stand" with a definite demand for $3 on lump and egg. Other companies that have been quoting $2.75 on egg and $3 on lump and making the spot on the latter somewhere between, say that they see no cause to change their attitude. As with domestic lump the urge of the buyer is lacking. There is a disposition to "play the market" with the supposition that retailers and country dealers will come with a rush, and then they will have to pay for the "spot" coal that is available.

Several local retailers have advanced the price on smokeless lump to $8 for August delivery though the general price runs at $7.50; mine-run is quoted at $5.75@$6; bituminous lump $6 and slack $4.25@$4.50.

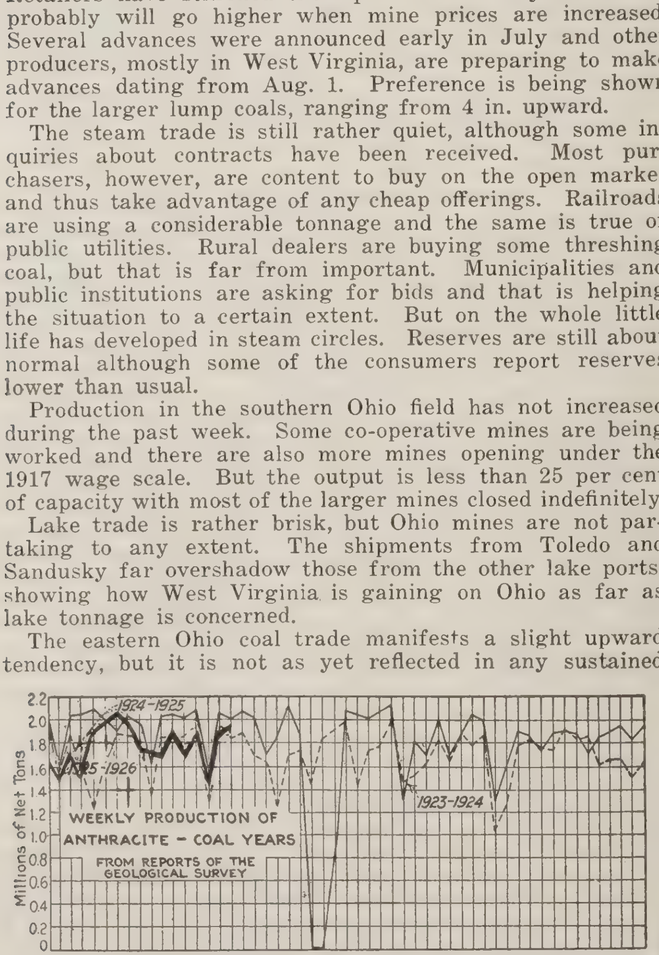
A slightly better feeling in domestic circles in Columbus has developed as a result of better buying of prepared sizes. Retailers have stiffened their prices materially and levels probably will go higher when mine prices are increased. Several advances were announced early in July and other producers, mostly in West Virginia, are preparing to make advances dating from Aug. 1. Preference is being shown for the larger lump coals, ranging from 4 in. upward.

The steam trade is still rather quiet, although some inquiries about contracts have been received. Most purchasers, however, are content to buy on the open market and thus take advantage of any cheap offerings. Railroads are using a considerable tonnage and the same is true of public utilities. Rural dealers are buying some threshing coal, but that is far from important. Municipalities and public institutions are asking for bids and that is helping the situation to a certain extent. But on the whole little life has developed in steam circles. Reserves are still about normal although some of the consumers report reserves lower than usual.

Production in the southern Ohio field has not increased during the past week. Some co-operative mines are being worked and there are also more mines opening under the 1917 wage scale. But the output is less than 25 per cent of capacity with most of the larger mines closed indefinitely.

Lake trade is rather brisk, but Ohio mines are not partaking to any extent. The shipments from Toledo and Sandusky far overshadow those from the other lake ports, showing how West Virginia is gaining on Ohio as far as lake tonnage is concerned.

The eastern Ohio coal trade manifests a slight upward tendency, but it is not as yet reflected in any sustained impetus to mining operations. Steam demand is a trifle better and retailers are beginning to stock for late summer and fall trade, but the latter are laying by principally smokeless fuels from West Virginia and eastern Kentucky. Steam buyers are buying pretty much for current needs only, although some of the larger consumers are said to be giving serious consideration to accumulating reserves soon.



The sharp demand for slack and screenings has subsided somewhat, though the supply is light and only small quantities of these grades are being offered. The spot price on slack and nut-and-slack has weakened 5 to 10c. per ton as compared with a week ago. Other spot prices show little change, but the trade confidently expects increased activity and possibly better prices in another thirty days.

Output in eastern Ohio during the week ending July 18 was 215,000 tons, or approximately 30 per cent of potential capacity. This was a decline of 11,000 tons from the previous week.

Another hope of the Ohio coal trade has been blasted, with the announcement that the Interstate Commerce Commission has denied any relief whatsoever in the freight rates from the mines to the docks on lake cargo fuel.

### Pittsburgh Expects Upturn

The Pittsburgh market continues practically as dull as it has been right along. Prices are unchanged, even in the case of slack. Transactions are generally between consumers and regular sources of supply, inquiries not getting into the open market to any extent. It is predicted in conservative quarters that there will be a decided improvement in demand soon, as stocks are lower than a year ago, when an upturn took place. The majority of mines are idle but most of those working are on part time, and until increasing demand gave these mines full employment prices would hardly advance. Afterward, some increase probably would be requisite to induce idle mines to start.

At Buffalo the coal trade drags along. Now and then a shipper shows a good list of orders, but even he finds trade dropping off again after a little. Several new concerns, mostly organized by members of the trade left flat by retiring agencies, are getting complimentary orders, which make them feel pleasant for the time, but they may find it hard to keep up that sort of trade very long.

The slack market is a little better. Gas slack is a few cents higher, but the demand is not much, if any, larger.

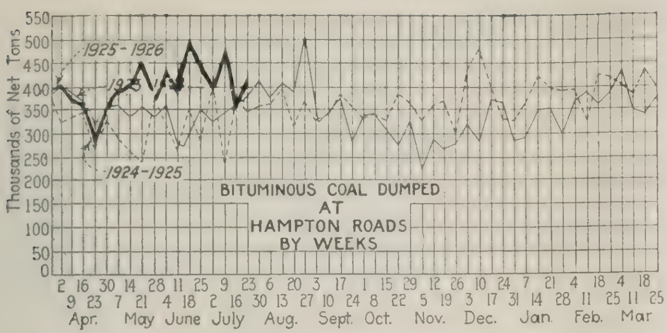
Quotations are $1.60@$1.75 for Fairmont lump, $1.40@$1.50 for mine-run and $1.25@$1.40 for slack; $2.25@$2.50 for Youghiogheny gas lump, $2@$2.25 for Pittsburgh and No. 8 steam lump, and $1.30@$1.50 for slack; $1.75@$2 for Allegheny Valley mine-run. Cambria County smokeless sells for $6 at the curb for domestic use.

### New England in Better Shape

The New England trade feels that production is now under better control and that soft spots are gradually being ironed out. It is clear that much less coal is accumulating at the Hampton Roads piers and it is a fact that receipts here are being restricted to tonnages well within the ability of the local market to absorb. Quotations are evenly on a firmer basis and the market seems definitely in better shape.

At Hampton Roads there is apparently no chance now of buying high-grade coal at less than $4.25 per gross ton f.o.b. vessel, and several agencies are holding their output firmly at $4.35@$4.40. Slack is now commanding more than $4 at the same point, although as yet there is little buying at any such figure. There are hopes of increased demand offshore, but no considerable tonnage has yet materialized. The bulk of the coal dumped continues to be applied on contracts, and there are few spot sales. Undeniably there is a better tone to the whole Pocahontas and New River industry, but the situation still calls for careful handling in that the possibility of overproduction is still threatening.

At Mystic Wharf, Boston, there is a disposition to get $5.40@$5.50 on cars both for spot coal and for deliveries over 30 to 60 days, but it is quite likely this will have to be modified if the rehandlers are to attract current business. Sales have been made at $5.35@$5.40, but for small tonnages; in no case have we heard of lots being placed that would exceed 1,000 tons. At Providence the average of the market is perhaps 5c. less than at Boston, while at Portland it is 10@15c. more. In none of this territory is there any rush of buyers to take on coal.



Only a few shippers of Pennsylvania coals all-rail are in position to report better business. The situation in that respect drags along with no special improvement. Mines that are in operation are still making a few sales on a minimum basis, with no very favorable prospect for August.

### Brighter Outlook at New York

Better business is expected next month in the soft-coal industry at New York. There is considerable more optimism at the prospect and exporters of American coals see possibilities of more orders and better prices in the British situation. In addition inquiries concerning screened bituminous coal and coke have added to the better feeling.

Spot orders are freer but prices remain on last week's level. Some operators producing the better coals report their output sold up for the next couple of weeks and are seeking higher prices for future deliveries. Replenishing of reserve stocks is expected to begin soon although at present consumers do not appear anxious about the matter.

At Philadelphia there are faint signs of improvement, shippers reporting that they are moving a little more coal. Though they are unable to get better prices, the increase in volume is putting them in better financial condition.

Spot prices are somewhat firmer. Shippers have lightened the pressure on consumers to take contracts, being disposed to hold more of their production for the spot market if trouble does develop.

At tide there has been a slight pick-up in the loading of pier coal, although there is not the least sign of permanency to the improvement.

Real optimists in the soft-coal trade are rare at Baltimore, though in the last week an increasing line of inquiry has been developing from former regular customers on the other side of the water and distributors of coal who for the most part use English fuels but are looking for possible trouble. One effect of this situation has been an increase in vessel rates. The threatened strike in the union soft-coal fields of this country, complicated by the possibility of an anthracite strike, has not greatly disturbed the soft coal trade. The price list for both gas and steam coals continues about the same as for the past several weeks. A decided improvement in the export situation has been noted.

Steam coal is moving fairly well at Birmingham for this season, though not a great amount of spot business is being taken on. Buying in the open market is scattering and confined to individual orders for a few cars here and there for current use, but this business in connection with contract requirements is keeping some of the mines on practically full time.

The domestic market is extremely dull, lump and other domestic sizes being very hard to move. An unusual number of domestic contracts have been canceled altogether and deliveries on a large number are being severely restricted. Retailers have ample stocks for some time to come. Spot buying of domestic fuel is practically at a standstill—or rather has never assumed any worth-while proportions.

Quotable prices are without change over a week ago, and although there is scant demand for domestic fuel the better grades are maintaining a stable schedule. Big Seam lump and the like is quoted $1.75@$2.25 per ton mines, with little call. Output for the week of July 11 was 358,000 tons, an increase of 42,000 tons over the same week in 1924.

### Hard-Coal Market Improving

Further improvement is noticeable in the anthracite trade at New York. Demand as well as prices for independent product are better and a brisk market is expected. Inquiries from New England were frequent last week and some orders resulted.

The situation, however, is not as lively as dealers would like it. Egg and stove are the most active sizes, with chestnut dragging somewhat but not sufficiently to cause any serious trouble. Some operators are said to have asked as much as $10 for stove coal when taken alone, but no sales were reported. Pea is moving well and is short with some producers for line trade. The smaller coals are in better condition. One of the large companies advanced its price for barley 10c. to $1.60 per ton for spot business.

A cargo or two of Welsh anthracite is expected in this harbor soon at a cost said to be around $10 c.i.f. It is estimated it will cost about 55c. more to put this coal in small boats alongside the piers.

The trade in Philadelphia is holding its own, and a fairly steady run of orders is being received by retailers. As all of them are intent upon keeping stocks up the shippers also are feeling better about the situation. The improvement is entirely due to the strike threat. Distant markets also seem to be awakening to the need of coal. This is particularly true of New England and New York State. Due to this a few independents have added 25c. to 50c. to their prices for shipment to that market.

Steam sizes are somewhat stronger, as the companies are finding a market for more of their tonnage, and the independents are moving theirs with no very deep cuts, although a considerable tonnage is still selling off circular.

The Baltimore public and dealers refuse to get excited over strike talk. Though many cellars are not fully stocked and some have not laid in any stock, nevertheless a fair proportion of coal has already been delivered. In addition dealers' yards have fair stocks on hand, and should there be a strike the first emergency conditions could be cared for. While nothing definite has been decided as yet, retail prices will undoubtedly advance Aug. 1.

Demand for hard coal at Buffalo continues pretty good, though there is no rush, as the public is divided on the question of a strike. In the event of a suspension it is expected that there will be an increase in the output of soft coal, especially smokeless, but that is likely to hurt the coal trade generally.

The price of domestic coke to wholesalers has already stiffened a little and it is said that an advance to consumers will be made on the day the miners go out, no matter what the plan is.

Lake shipments are still light, being for the week 56,800 tons, of which 18,500 tons cleared for Duluth and Superior, 23,200 tons for Milwaukee, 8,700 tons for Green Bay, 3,000 tons for Marinette and 1,500 tons for the Sault. Rates are unchanged.

### Connellsville Coke Market Slightly Firmer

The spot market on furnace coke at Connellsville advanced last week, various small lot sales and one 25-car sale having been made at $2.90 compared with a quotable market since the middle of June of $2.75@$2.85. One rather small-sized contract to the end of the year has been made at a higher price for the period after Oct. 1 than for the period before. Otherwise the contract market has remained dead. There is no likelihood of anything occurring until the merchant pig-iron trade improves and there is no prospect of that in the near future. Few furnaces are running but there are stocks from which shipments are being made, the stocks decreasing but slowly.

Spot foundry coke is a trifle more active than thirty days ago but is still relatively dull. The movement has been restricted for many weeks by a considerable tonnage of 48-hour coke, partly selected, being sold for foundry use, this coke having lately been going at as low as $3.10 or $3.15. Standard foundry coke, which means 72-hour selected, remains quotable at $3.75@$4.25, where it has stood since early May. Sales at $4.25 have been gradually diminishing and now are only occasional.

## Car Loadings, Surplusages and Shortages

# Foreign Market And Export News

## Uncertainty of Supply Has No Effect On British Demand or Prices

The coal market has not been materially affected by the past week's events. Some concern is shown by inland consumers, who, solely dependent on home supply, are taking in extra stock. On the export side the only increase in business is on coaling depot account, where bookings are better. The aggregate volume of demand, however, is poor and insufficient to influence prices. All transactions are for this month's loading, both buyers and sellers showing no desire to enter into business for August in view of the uncertainty of supply. The Continental demand continues restricted and despite the unsettled outlook in United States coal fields, there is no extra demand from South America.

At Newcastle there has been no change in the coal position for Northumberland and Durham during the past week except in the raising of quotations by sellers for July fuel. It has not had any effect on buyers one way or another. The possibility of a stoppage in the local coal fields by the end of the month has not sent them hurrying to buy, as is usually the case when such a crisis arises. Meanwhile collieries continue to close, though some are on a day to day notice and others on notice are carrying out negotiations with a view to local settlements.

Output by British collieries in the week ended July 11, a cable to *Coal Age* states, totaled 4,820,000 tons, compared with 4,675,000 tons in the preceding week.

### Unrelieved Dullness Pervades French Coal Market

The French coal market is extremely calm and nothing points to any improvement in the near future. The North and Pas-de-Calais collieries maintain price schedules at the July 1 level, there having been no official change in over a year and a half. Everyone knows, however, that in slack periods it is easy to obtain concessions. At the national congress recently held at Carmaux the men's delegates for all the basins adopted a motion that if the employers reduced wages—indeed if the last measures relative to them were not cancelled—a strike would be decided upon by the whole corporation. But in spite of this threat the collieries appear quite assured, particularly in the North and Pas-de-Calais.

The British situation is being watched in France with much anxiety. A number of importers of British coals are of the opinion that a strike cannot be averted.

From June 1 to 20 the O.R.C.A. received from the Ruhr 351,300 tons of indemnity fuels, including 158,900 tons of coal, 176,300 tons of coke and 16,100 tons of lignite briquets.

During the first eight days of July the O.R.C.A. received from the Ruhr 55,700 tons of coke, a daily average of 6,960 tons. Receipts for June totaled 215,844 tons, an average of 7,000 tons per day.

### Strike Upsets Belgian Market

The general situation in the Belgian coal market is worse, owing to the strike in the Charleroi Basin. Conditions are particularly bad in the Borinage, the Center and the Charleroi regions. More men have been dismissed and some more pits may be closed down. The rise of exchange has paralyzed imports, except with regard to France. On Aug. 1 the salary question is to be settled.

### Hampton Roads Market Firmer On Expectation of Strike

Little change was apparent last week in the market at Hampton Roads, although there were appearances of a stronger market soon in view of the likelihood of a hard-coal strike. Prices remained practically unchanged for small lots for immediate dumping, although large lots for future dumping were far above the market.

A number of inquiries for foreign coal shipments were reported by shippers, though no large sales were made. Foreign business is expected to boom in case a strike of miners takes place. Supplies on hand were slightly below normal at the piers, but dumpings for the month were normal, if not better.

# News Items From Field and Trade

## ARKANSAS

The Greenwood Coal Co. will resume operations under the 1917 rate scale with conditions of the 1924 contract to be enforced wherever possible, according to notices posted in Greenwood July 17. The mine is one of the largest in the state and has been closed for several months. Although the exact date of opening was not given it was unofficially announced that several days would be required for cleaning up the mine, as it has been inactive for a long period. Soon after the Backbone Coal Co., of Excelsior, announced its intention of operating under the 1917 wage scale, the tipple of the mine was burned. Everything now is quiet around the mine and there have been no disturbances. Mine No. 2, which is to be opened, according to the posters, is said to have a normal capacity of from 500 to 750 tons daily and employs 300 men.

## COLORADO

The Ajax Coal Mining Co., operating a mine near Louisville, in Boulder County, notified the state Industrial Commission July 20 that an agreement had been reached between the operators and miners for a 20-per cent reduction in wages, effective immediately. This action is believed by officials to be the first step in breaking the apparent deadlock in the northern field. Most of the operators have asked the commission for permission to reduce wages 30 per cent, the men generally objecting to more than a 20-per cent reduction.

When the Moffat tunnel is completed and the proposed extension of the Moffat road made from Craig, Colo., to Provo, Utah, valuable coal beds, covering an area of 450 square miles southwest of Craig, along the Yampa River, will be tapped, according to a report by government engineers to the Department of the Interior. There will be no extensive exploitation of the coal fields until there is a railroad through or near the area, the report indicates. Coal to be found there is bituminous, and the beds occur in the Mesa Verde geologic formation. There are many thick beds of coal in the area mentioned, the report says.

A committee of workers from the Leyden coal mine, in Jefferson County, where a strike is in progress reported to the State Industrial Commission on July 18 that hoist men, pumpers and others remaining on the job to afford safety of the property had refused to assist into the mine men said to have been employed to succeed workmen now striking. The Industrial Commission is powerless to act in the dispute. It recently permitted the company to cut the wages of miners 20 per cent. The company had asked for a 30 per cent reduction. The miners, it is said, agreed to take the 20 per cent cut, but objected to an alleged attempt on the part of the company to put in effect a 30 per cent arbitrary reduction. Ninety miners walked out July 13.

Colorado coal mines produced 599,302 tons in June compared with 565,335 tons in the same month a year ago, a decrease of 33,967 tons. The total output in the first six months of the current year was 420,000 tons less than for the same period a year ago. The average number of men employed in and about the mines for June was 11,731. The number of days worked per mine was 82.4.

The Colorado Fuel & Iron Co. reports net earnings of $1,649,944 for the second quarter of 1925, compared with $1,037,050 in same period last year, and surplus of $684,157, compared with surplus of $58,635 reported last June.

The National Fuel Co., Denver, was placed in the hands of a receiver July 16, following the institution of foreclosure proceedings in the District Court by the International Trust Co. H. Van Mater, president of the company, was named as receiver by District Judge Charles C. Butler, who fixed bond in the sum of $100,000. The bank alleges that the company is wholly unable to pay its debts and obligations, and that its financial affairs are in an embarrassed condition. In an answer, the fuel company admitted the allegations of the bank, and agreed to the appointment of the receiver.

## ILLINOIS

Orders for resumption of work at Mine No. 2 of the Bell & Zoller Coal Co., at Zeigler, have been issued from the main office of the company in Chicago. The opening of this large mine is attributed somewhat to the results of the recent 1,600-mile "Good will tour" made by citizens of Ziegler three weeks ago, starting in St. Louis, passing through five states and terminating in Chicago six days later.

Formal announcement has been made by officials of the United Electric Coal Co., Danville, of the abandonment of its No. 6 mine, located west of that city. The strip mines of the company are all working, however. The mine has been idle for practically two years although it was maintained and kept in condition in the hope that the coal market would improve sufficiently to warrant operations. Such hopes, however, have not materialized and as a result J. C. Anderson, general superintendent, announces that the supplies and equipment are being removed.

The Jay Coal Co., mine, at Bethalto, which has been closed down since Dec. 15, 1923, when it failed to meet its payroll, will be sold under a mortgage foreclosure on Aug. 17 at the courthouse in Edwardsville, to the highest bidder. The Bethalto mine is the largest mine in this section of the county. In January, 1924, H. E. Kelsey, cashier of the Bethalto State Bank, which is the mortgagee, was appointed receiver of the mine, to preserve it. Three acres of ground upon which the mine property is located and the mine shaft is sunk will be sold in addition to all the mining property.

## INDIANA

A hearing on the petition of the Chicago & Eastern Illinois R.R. to increase the fares on its miners' trains in the Clinton coal field from a monthly commutation rate of $1.10 to $2.50 and to suspend train operation when mines are idle was heard last week by the Indiana Public Service Commission. A delegation of miners attended the hearing to protest against the proposed changes. The miners contend that the increase of fares is not warranted because the work of the miners gives the railroad company a heavy coal tonnage which produces large revenues to the company. They also assert that enough miners are employed on idle days to warrant operation of the trains.

The Patoka Coal Co., Petersburg, has closed a contract for 500 acres of stripping coal land just north of Winslow, and surveyors are arranging for a switch from the Southern Ry. to the new property. The company is a pioneer in the stripping coal industry in Indiana. It now is operating a mine at Blackburn and has taken over a large acreage near Hartwell. Machinery will be installed as soon as the switch is completed.

## IOWA

Merger of fourteen Iowa coal companies, controlling 20 mines which yield 85 per cent of the coal mined in Polk County, will be completed about Sept. 1, according to a recent report by operators interested. Appraisal of the various properties is under way. Some of the companies will sell outright to the merger and others will take stock in the consolidated concern. The mines will be under a single management and their retail offices also will be combined.

## KENTUCKY

The Great Western Coal Co., Madisonville, has changed its name to the Hawley-McIsaac Coal Co., with C. R. Hawley as president. The company has acquired by purchase and lease about 10,000 acres of additional coal land in Hopkins County, and is about to open another strip pit equipped with a five-track steel tipple and will later open two other strip pits as well as some shaft mines.

L. L. Hazelwood and sons, who have been at work sinking a coal shaft at Graham hill, on the Zion road, east of Henderson, report that at an early hour July 11 they struck a bed of No. 11 coal over 4 ft. deep. The firm is known as the Graham Hill Coal Co. and it mined coal there a year ago, but the bed was shallow and the new shaft was sunk.

Three suspicious looking fires have occurred in western Kentucky recently. The Beaver Dam Coal Co. lost a commissary store building last week and the Huff Coal Co., at McHenry, lost a tipple. On the morning of July 21 fire destroyed the big four-track tipple of the Dawson Daylight Coal Co., near Dawson Springs, causing a loss of about $25,000. The fire occurred at a time when the big strip operation, which is comparatively new, was loading on an average which would have given over 20,000 tons for the month. In June production was over 17,000 tons. Rebuilding will start at once, on the same foundations, and the new tipple will be of wood, as it would take too long to install steel. The company probably will erect a temporary structure for handling mine-run until the plant can be rebuilt.

## MISSOURI

The Mulkey Coal mine at Macon is being cleaned out preparatory to loading coal this week. About 65 men will start in, and more will be added as the demand increases. The manager, Horace Whetsel, expects the mine to run steadily through the summer and fall with an increased output during the winter. The mines at Bevier, 5 miles west of Macon, are still closed down, but it is hoped that arrangements will be made for the resumption of work there by fall.

Marceline Mine No. 2, at Marceline, is again in operation. A company of miners of the city have leased the property from the owners and are busy preparing everything for the production of all coal which will be needed to supply the market. The lessees will retain the old name, the Marceline Miners' Co-Operative Coal Co. John Stewart will be the foreman. The Sunshine Coal Co. also is working more than thirty men.

## OHIO

The Pittsburgh Coal Co. is gradually increasing its operating forces at its three mines in the Pomeroy field where the 1917 wage rate is in force. The last semi-monthly pay roll totaled $22,000, which was $4,000 more than the previous pay.

**Shamrock Mine Tipple**

A modern steel structure at the West Kentucky Coal Co.'s operation at Providence, Ky. This mine is five years old and has a capacity of 2,000 tons per day. Acquisition of the St. Bernard mines has made the West Kentucky Coal Co. one of the largest producers in the country.

Two mines at Wainwright, six miles south of New Philadelphia, owned by the Midvale Goshen Coal Co., Cleveland, resumed operations July 16 after being idle since June 1. The mines started up with 200 men and are working three or four days a week. Three mines of the Underhill Coal Co., Cleveland, at Mullins, idle fourteen months, also will resume soon. Fifty men will be employed and the number increased to 150 in a year.

F. W. Braggins, president of the Lorain Coal & Dock Co., of Columbus, gives interesting figures on lake tonnage loaded up to the end of June at the various lake ports. Up to July 1 the ports of Huron, Lorain, Cleveland, Fairport, Conneaut, Cleveland and Erie loaded 1,560,000 tons of lake coal, both cargo and bunker, as compared with 6,650,000 tons loaded at Toledo and Sundusky in the same period. The ports of Toledo and Sandusky handle West Virginia and Kentucky coal almost exclusively while the first mentioned ports handle Ohio and Pennsylvania coal. In the same period of 1923 Toledo and Sandusky loaded 3,866,000 tons as compared with 6,233,000 tons loaded at the other ports, and during the same time in 1924 Toledo and Sandusky loaded 3,496,000 as compared with 2,995,000 tons loaded at the other ports.

In the second annual Ohio first-aid contest, held at Zanesville, July 18, the team representing the Maher Collieries Co., of Glencoe, won first place among 29 teams participating. The miners' team from Lore City, which won the contest last year, was completely outclassed and finished fifth. A large crowd was attracted to the meeting, which will be held yearly from now on.

The Western office of the West Virginia Coal & Coke Co., which was located in the Atlas Building, Columbus, previous to the merger, has been consolidated with the Cleveland office. R. D. Jeffers, who was in charge of the Columbus office, has become connected with the Cleveland office. The change took place early in July.

Deputies from the Ohio Mine Department recently removed the seals on the Blue Rock Mine, owned by the Blue Rock Coal Co., of Zanesville, which caught fire about six months ago. It was found upon inspection that the fire was extinguished and since the company desired to start operations the seals were removed. The work of ventilating the mine is going on and the equipment is being repaired. Active operations will start about Aug. 1.

Several hundred miners were idle for more than a week because of the flooding of the Provident mine of the Clarkson Coal Co., located near St. Clairsville. The flooding resulted from a cloudburst in the neighborhood.

## OKLAHOMA

An organization known as the Henryetta Coal Operators Association has been perfected by the operators in the Henryetta field. J. G. Reid, with the Wise-Buchanan Coal Co., the largest producing company in the field, was the choice for president, and J. Henton was named secretary. Practically all operators in the field are members of the new association. With one or two exceptions, the 1917 wage scale is being paid. Records for hoisting coal were said to have been broken here one day last week, when the daily amount exceeded that for any other day in the last two months. Coal loaded in June exceeded the amount loaded in June, 1924.

## PENNSYLVANIA

Strike talk in the anthracite field has increased the possibility for prepared sizes of bituminous coal in the central Pennsylvania field, which could furnish several million tons monthly of low-volatile coal for domestic use. During the last few years many tipples have been equipped to make different sizes of prepared coal.

On account of the industrial depression in the Broad Top field, and especially in the vicinity of the mines of the Colonial Iron Co., a large number of men normally employed in the mines are working on the state road under construction between Bedford, Pa., and Cumberland, Md. The men are camping near the scene of construction.

An application of the East Broad Top Railroad & Coal Co. for the construction of a dam in Hill Valley Creek at Mt. Union made to the State Water and Power Resources Board is being held up for investigation and a hearing may be ordered as part of the state's plan for preventing stream pollution. The State Sanitary Water Board is now investigating the matter and because of the belief that coal-mine discharges would pollute the Juniata River the State Conservation Council and the Central Pennsylvania Fish and Game Association may enter formal protests against the application. The Water and Power Resources Board has been active recently in attempting to prevent pollution of streams which are now clear and to reduce pollution of other streams.

Through the efforts of the Davis Coal & Coke Co., the Boswell mine, in Somerset County, is 100 per cent first aid. The mine rescue car of the Department of Mines has completed instructing the men and Boswell mine has the distinction of being the first mine in Pennsylvania to be certified 100 per cent first aid.

The Wilkes-Barre court is co-operating with mining companies in the anthracite field in an effort to prevent smoking by miners while at work in gaseous mines. Under a state law, smoking is prohibited in such mines and the attempt is being made to enforce the law. For the first offense a fine must be paid to some charitable institution. The offender also is warned that a repeated offense will bring a larger fine as well as a sentence of imprisonment. Foremen have been instructed to exercise special vigilance to prevent smoking and in cases where the regulations are violated repeatedly, they will discharge the offenders. Years ago the clay pipe was the friend and companion of the miner, but the present generation, mine officials say, have almost discarded the pipe in favor of the cigarette.

Miners employed at the Kinloch mine of the Valley Camp Coal Co., at Parnassus, near Pittsburgh, accepted a proposal of the company that they forego receipt of their semi-monthly wages for a period of six weeks, or until such time as the company shall be in a position to pay them. It was stated, however, that in no circumstances shall the agreement provide for payment later than Aug. 28. The payroll of the company's mine, which operates union, is about $30,000 a month.

Fire, believed to have been of incendiary origin, last week destroyed the chute leading from the pit mouth of the Scott Haven Coal Co. mine at Scott Haven to the Pittsburgh & Lake Erie railroad tracks, compelling the mine to suspend operations for a time until the chute is rebuilt. The damage amounts to several thousand dollars. The chute was discovered on fire in three different places. The mine is a small one that has been operating non-union.

Only three of the nine railroads that traverse the Pittsburgh district are loading less coal than at this time last year, it is learned from roads' records. These three lines are the Pittsburgh & Lake Erie, Montour and the Union. The Pennsylvania, Baltimore & Ohio, Pittsburgh & West Virginia, Buffalo, Rochester & Pittsburgh, Monongahela and Bessemer & Lake Erie are loading more coal than at the same time last year.

A plan whereby the Chamber of Commerce of Pittsburgh undertook to solve the coal situation in western Pennsylvania, looking to the reopening of the mines, probably was abruptly checked on July 22 when Patrick T. Fagan, president of District No. 5, United Mine Workers, announced that the miners would refuse to join the operators in any plan that would involve a district agreement or any change from the Jacksonville agreement. The Chamber of Commerce proposed in resolutions, and followed this with the appointment of a committee to carry them out, that the operators and miners each form new organizations for ironing out of differences which are keeping the mines closed.

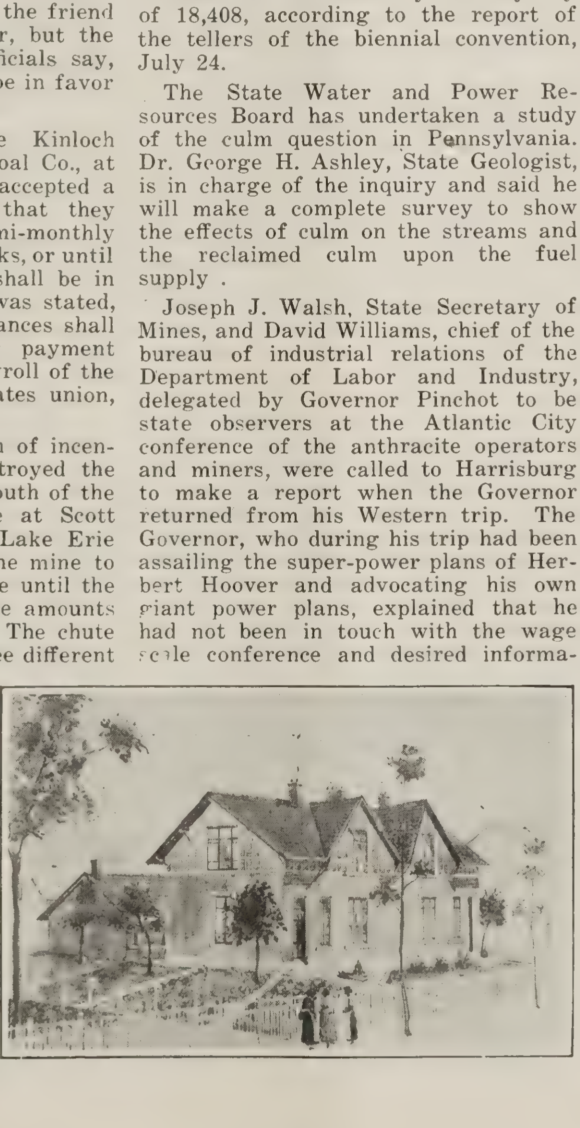
Rinaldo Cappelini, president of District 1 of the United Mine Workers, was re-elected to that office over William J. Brennan by a majority of 18,408, according to the report of the tellers of the biennial convention, July 24.

The State Water and Power Resources Board has undertaken a study of the culm question in Pennsylvania. Dr. George H. Ashley, State Geologist, is in charge of the inquiry and said he will make a complete survey to show the effects of culm on the streams and the reclaimed culm upon the fuel supply .

Joseph J. Walsh, State Secretary of Mines, and David Williams, chief of the bureau of industrial relations of the Department of Labor and Industry, delegated by Governor Pinchot to be state observers at the Atlantic City conference of the anthracite operators and miners, were called to Harrisburg to make a report when the Governor returned from his Western trip. The Governor, who during his trip had been assailing the super-power plans of Herbert Hoover and advocating his own giant power plans, explained that he had not been in touch with the wage scale conference and desired information. Richard H. Lansburgh, Secretary of Labor and Industry, attended the meeting with the Governor. While none of the men present would discuss the meeting it is understood that the observers told the Governor that a compromise does not seem possible at this time.

**Workmen's Residences**

Design for a mine worker's residence in the environs of Lens. France. The French miner may not have an automobile but he expects to live in a good house.



## TEXAS

For six months ended June 30, 1925, the Texas Pacific Coal & Oil Co. reports net earnings of $1,081,380 before depreciation and depletion, compared with $1,267,858 in first six months of 1924. Net earnings for the second quarter of 1925 were $588,254 comparing with $493,126 in the preceding quarter and $686,184 in the second quarter of 1924. The company closed the first half year with more than $1,000,000 in cash, while its current obligations consisted entirely of current expenses, there being no bank loans.

## UTAH

On July 16 the committee appointed to take charge of the public fund raised last year for the dependents of the victims of the big mine explosion at Castlegate handed in their report. The amount raised by subscription was $104,925.76. Twelve families left without fathers were helped back to their relatives, more than half of them in foreign countries. The fund was raised at the call of Governor Chas. R. Mabey, now out of office.

An amendment of the city ordinance forbidding the use of oil burners as heating plants in residences of Salt Lake City was recommended to the City Commission on July 17 by the retiring City Engineer, Mr. Cannon, who stated that a more general use of oil burners throughout the city would be desirable on the grounds of economy, cleanliness, convenience and as a help in controlling the smoke nuisance.

Coal mined in Utah in June totaled 280,830 tons, compared with 261,975 tons for same month last year and 251,874 tons in May of this year. In the first half of the present year 2,019,046 tons were produced compared with 1,946,766 tons for the same period of 1924. The heavy production of 531,600 tons of June, 1920, has not been equalled since.

## VIRGINIA

S. B. Hall, sales manager of the Smokeless Fuel Co. at Norfolk, is seriously ill in a Norfolk hospital.

Captain Inslee T. West, for a number of years Norfolk representative of several steamship lines and tugboat companies engaged in the coal trade, has gone to Savannah, Ga., and R. M. Foster is now handling the business.

The Virginia Iron, Coal & Coke Co. reports gross earnings of $671,634 for the three months ended June 30, 1925, against $760,242 in the same period last year. After all expenses and reserves for interest and taxes, the company reports a net loss of $70,264 for the June quarter, against a loss of $51,199 in the

June quarter last year. For the first six months of 1925 the company reports gross earnings of $1,510,886, against $2,180,986 in the first six months of 1924. After similar deductions the company reports net profit of $147,041 for the half year equal to 84c. a share earned on the common stock after preferred dividend requirements. In the first half of 1924 a net loss of $45,407 was reported.

### WEST VIRGINIA

After an idleness of two years, Delmar Mine No. 1 of the Delmar Coal Co., in Flemington, is being cleaned up preparatory to a resumption of operations. Since the mine was closed down a good deal of rock and slate has fallen on the tracks and it will require about 25 men more than two weeks to clean up the débris. When operations are resumed 200 men will be employed, it is stated. The plant was formerly operated by the Pittsvein Coal Co. Charles Dawson, of Flemington, has been appointed to act as superintendent in charge of operations.

The Island Creek Coal Co., operating in the Logan County field, loaded 525,000 tons of coal in June, exceeding May production by 4,000 tons. Output for the first half of the year reached a total of 2,765,200 tons, compared with 2,050,907 tons in the first six months of 1924 and 1,278,818 tons in the first half of 1923.

These coal corporations were launched in West Virginia in June: The Copen Creek Collieries Co., of Gilmer, with a capital stock of $25,000; Mercer Coal & Supply Co., Inc., capital, $25,000; Booth Coal Co. of Clarksburg, capital $25,000; Lake & Export Coal Co., of Huntington, capital of $30,000 of stock with par value and 200 shares of no par value; Lecony Smokeless Coal Co. of Huntington and Besoco, capital, $100,000; Pascal Coal Mining Co., of Morgantown, capital, $50,000; Lanark Fuel Co. of Beckley, capital, $100,000; Thornton Coal Co. of Bluefield, capital, $100,000, with chief works in Kentucky; Pittsburgh-Kanawha Coal Co., organized by J. H. Roelofs, of Pittsburgh, capital, 1,000 shares of no par value.

A new issue of $850,000 West Virginia-Pittsburgh Coal Co. first closed mortgage 6 per cent sinking fund gold bonds, due July 15, 1930, was announced last week by Paine, Webber & Co., New York. The offering price is 98 and interest, to yield 6.45 per cent. The property of the company is located in Brooke County.

The Holly-Elk Coal Co. has increased its capital stock from $350,000 to $500,000 and the following companies have reduced their capital: Forest Coal Co., from $300,000 to $20,000; Diamond Coal Co., from $200,000 to $10,000; Dale Coal Co., from $150,000 to $50,000; Soper-Mitchell Coal Mining Co., from $150,000 to $25,000; Elm Grove Mining Co., from $3,000,000 to $2,000,000; Kelly's Creek Colliery Co., from $2,000,000 to $1,600,000; New Gauley Coal Corporation, from $10,000,000 to $5,000,000.

Notices have been sent from the West Virginia Department of Mines to coal companies throughout the state of West Virginia calling attention to the fact that recently enacted changes in the mining laws became effective on July 21. Much importance is attached to an addition to the laws with reference to the ventilation of mines, the new provision reading as follows: "In all mines, accumulations of fine coal dust shall, as far as practicable, be removed from the mine and all dry and dusty sections kept thoroughly watered down at all times, or rock-dusting or other approved means used for allaying dust."

### WYOMING

The annual first aid and mine rescue field day of the Union Pacific Coal Co. will be held at Rock Springs first-aid park on Saturday August 8th next. Teams from the several U. P. camps will compete for honors, and the winners of the meet, in addition to being showered with honors locally, will represent the Union Pacific Coal Co. at the national meet in Springfield, Ill., on Sept. 10, 11 and 12, next.

### CANADA

On July 21 Premier E. N. Rhodes and Col. Gordon Harrington, Minister of Mines in the new administration of Nova Scotia, held a conference at Sydney, N. S., with President Roy M. Wolvin and Vice-President J. E. McLurg of the British Empire Steel Corporation, and the executive board of District No. 26, U. M. W., with the view of effecting a settlement of the coal strike. After two days' deliberations the conference was adjourned for a day. The parties to the conference agreed to leave the issuing of any statements to Premier Rhodes, who stated that he did not see that any purpose could be served by giving out any report.

Peat Fuels, Ltd., a Montreal company, has taken over the experimental peat plant at Alfred, Ont., where tests were carried on by the Dominion government for several years to ascertain the feasibility of producing peat as a domestic fuel as a substitute for anthracite. The company has undertaken to operate the plant and put the product on the market through the regular commercial channels. About 5,000 tons of peat briquets will be available for use during the coming winter. While this quantity is too small to have any immediate effect on the situation it will determine the commercial possibilities of peat and its ability to compare with coal. The retail price at Ottawa and Montreal probably will be $11 or $12 per ton.

At the annual meeting of the Crow's Nest Pass Coal Co., held at Fernie, B. C., on July 10, the following officers were elected: W. R. Wilson, president; A. H. MacNeill, first vice-president; A. H. Robinson, second vice-president; A. Klauer, treasurer; G. H. Hess, Jr., comptroller, and J. S. Irvine, secretary.

## Traffic

The brief of the government, filed in answer to the suit brought by the Ford interests against the Interstate Commerce Commission's ruling in the assigned car case, states that it is merely a question of whether the Ford interests will regulate cars in the interests of the automobile industry or in the interest of the public in time of car shortage.

## Obituary

**Captain Frederick Ebersbach**, one of the best known coal operators and capitalists in southeastern Ohio, died at his residence in Pomeroy, Ohio, recently, after an illness of several months. He was 66 years of age and had been a resident of Pomeroy all of his life. Captain Ebersbach, who received the title from his steamboat experience on the Ohio River, owned a number of mines in the Pomeroy Bend field which were sold about five years ago to the Great Lakes Coal Co. Since that time he had been engaged in other enterprises, notably being chairman of the board of the Neil House Co., of Columbus, which has just completed a 12-story modern hotel. He was engaged in years past in towing coal on the Ohio River and was the first to transport coal by water from the Pomeroy field. Funeral services were held July 14 at his late residence.

**Col. William T. Clark**, manager of the Empire Fuel Co., Buffalo, died July 11, after a long illness, aged 87, leaving one daughter. He was uncle to Eugene C. and William T. Roberts, in the coal business in Buffalo, and Clark T. Roberts, in the coal business in Chicago.

## Coming Meetings

**Rocky Mountain Coal Mining Institute.** Summer meeting, Aug. 26-29 at Price, Utah. Secretary, Benedict Shubart, Denver, Colo.

**American Institute of Mining and Metallurgical Engineers.** 132d meeting, at Salt Lake City, Utah, Aug. 31 to Sept. 3. Secretary, H. Foster Bain, 29 West 39th St., New York City.

**Oklahoma Coal Operators' Association.** Annual meeting, Sept. 10 at McAlester, Okla. Secretary, A. C. Casey, McAlester, Okla.

**New York State Coal Merchants' Association.** Annual convention, Sept. 10-12, at Richfield Springs, N. Y. Executive Secretary, G. W. F. Woodside, Arkay Bldg., Albany, N. Y.

**Association of Iron and Steel Electrical Engineers.** Annual meeting at Philadelphia, Pa., Sept. 14-19. Secretary, John F. Kelly, Empire Bldg., Pittsburgh, Pa.

**National Safety Council.** Annual meeting Sept. 28 to Oct. 2, at Cleveland, Ohio. Managing Director, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

**Tenth Exposition of Chemical Industries,** Sept. 28 to Oct. 3, at Grand Central Palace, New York City.

**Electric Power Club.** Fall meeting at Briarcliff Manor, N. Y., Oct. 19-22. Secretary, S. N. Clarkson, B. F. Keith Bldg., Cleveland, Ohio.

**Canadian Institute of Mining and Metallurgy.** Annual western meeting Nov. 3-5, Winnipeg, Manitoba, Can. Secretary, George C. Mackenzie, Drummond Bldg., Montreal, Que., Can.

**American Society of Mechanical Engineers.** Annual meeting at New York City, Nov. 30-Dec. 3. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

**Fourth National Exposition of Power and Mechanical Engineering,** Nov. 30 to Dec. 5, at Grand Central Palace, New York City.

**Coal Mining Institute of America.** Annual meeting, Dec. 9-11, Pittsburgh, Pa. Secretary, H. D. Mason, Jr., P. O. Box 604, Ebensburg, Pa.

## "Stop Thief!"

VICTORIAN-MINDED READERS who still cling to the belief that Dickens and Thackeray have not been crowded into the limbo of obscurity by such moderns as D. H. Lawrence and Arthur Schnitzler will recall the episode in "Oliver Twist" in which the Artful Dodger diverts suspicion from his own filchings by leading the pack in the cry of "Stop thief." Something of the same time-honored strategy is strongly suggested in the persistent demand of spokesmen for the miners at Atlantic City that S. D. Warriner and W. J. Richards again take up the thankless and arduous rôles those two veterans of wage negotiations have so lately escaped—that and something more.

In the face of repeated official and unofficial denials that the operator members of the sub-committee cannot take final action without the approval of the retired veterans, the impression is assiduously spread that the miners' adversaries in the present negotiations are powerless marionettes. Whether by design or not, the prolonged absence of Mr. Lewis from the inviting ocean front served to give a deeper color to that impression. Somewhere, somehow, hint these impressionistics, a miner—presumably the redoubtable Mr. Lewis himself—and an operator or operators—obviously Messrs. Warriner and Richards are meant—will sneak into secret conclave and sign another truce in the anthracite wage war.

But those who will take the trouble to examine the verities of the situation will appreciate the appositeness of the Dickensian comparison. The operators sitting at Atlantic City insist that they are fully empowered to negotiate an agreement, and there is no reason to doubt either the truthfulness of that statement or the sincerity of the men making it. The miner members of the committee, on the contrary, have absolutely no power to *negotiate* any agreement. They cannot vary one jot from the demands framed by the tridistrict convention at Scranton last month. Even if convinced that logic and justice were all on the side of the employers, Mr. Murray and his able associates could do no more than recommend to the tridistrict convention a recession from its position. That body, and not the miners at Atlantic City, have both the first word and the last word.

Under these circumstances it comes with poor grace for men who admit they have no power to charge a similar impotency to those who possess full freedom of action. It bespeaks both a wilful attempt to befog the issue and to mislead the public and a confession of the weakness of the miners' case. How else shall we account for such a persistent perversion of the facts?

## Psychiatry

THE study of diseased minds is psychiatry, and as all minds are diseased when obsessed with anger, we commend the study of this science to the coal industry. An example of a diseased mind comes to mind. Two men were discussing the anthracite situation. One thought the prices of hard coal was scandalously high, and was incensed at the coal companies. Seeing the operators were having a dispute with the miners over the wage scale, he took the side of the miners and hoped they would get more money. Thus because he had to pay so much for coal he was ready to create a condition that would cause the price of coal to go higher.

This is no time for argument; the public needs a cure for its shattered nerves. In its jumpy condition it no longer is able to think. It blames the operator for suspensions, though it is the miner who causes them. It blames the producer for the high prices, though it is the miner whose wages have raised the cost. It blames the high wages for high costs and then insists that a settlement be made promptly at any scale the miner may present. It condemns the operator for not agreeing with the union and then terms an agreement when made mere collusion. That is a psychosis—derangement of the brain.

## Crawling Under the Fence

HIGHLY DEVELOPED equipment can only be handled with technically trained help. Unless a man has had the proper training in the fundamentals of mechanism and electricity he cannot hope to make proper use of such equipment. He will oppose its introduction, knowing that his ignorance will be exposed and that he will be unable to meet the problems its operation will involve. It must be confessed that not every man who lacks technical training is prone to rely on past practice, but too many are.

It has been said that the college student relies on his instructor and has a repetitive mind, but that is far less obvious than it is in the non-technical man. He too often refuses to believe in what he has not seen and operated. The man of books may be a slave to printer's ink, but how much wider is his horizon than that of the man whose range is limited to the experience of his daily task!

The printed word brings him information from everywhere. The man who depends on past practice and who stays in one place has only one source of instruction and that *has* dried or is drying up. The vices of book learning have been over-emphasized. There are such vices, it is true, but worse yet is the vice of relying on mere experience.

In defense of self-made men instances are frequently advanced of persons who are, only in a sense, self-made and in truth have been careful book students all their lives. Such men, do indeed, do well. Theirs is a working scholarship, and in these days of dances, movies, bridge parties, golf, tennis, radio and automobiles there does not seem much probability that the average man will tutor himself as well as he would be instructed at college.

To managers, superintendents and foremen who wish to have their sons follow their profession, we would strongly recommend that they give them college training. The future generation will demand that the men in control are thus duly instructed and will be little disposed to recognize those who crawled under the fence.

## The Facts in the Case

NO ONE could have believed that the public would close its eyes and its ears to the determination of the anthracite operators to avoid a suspension and submit the dispute with their employees to arbitration. Here were outstanding facts, simple and understandable, not merely hinted at but written in the plainest possible English, but to judge by all that is published and heard on the street the words might just as well never have been uttered. This shows how necessary it is to state and re-state facts for fear that there will be some who have not heard or read, or, having heard or read, have not understood. More than one man known to read his newspaper diligently has actually remarked that he thought the dispute was already settled.

For such ignorance, misapprehension and gross misstatement there is only one cure: reiteration in advertising. If the papers (unfriendly to the few who own mines and subservient to the many who work in them, to the even greater number who consume the fuel the mines produce, or to the legion who favor labor as against capital), will not carry the story editorially or on the front page and only meagerly on other pages, then there is no recourse but advertising.

In Great Britain the Information Department of the British Colliery Owners' Association is financed by a direct levy on a tonnage basis, and in 1922 the sum of one million pounds was expended to carry to the electorate the true story of British mining, the department being under the control of Philip Gee. One of the local secretaries who was a member of Mr. Gee's committee on publicity was in favor of a levy of six cents per ton to carry the facts to the public in 1926. Perhaps this sum has not been voted, but still it shows what some British operators feel should be done to meet the determination of the radical element to make unreasonable demands for the nationalization of the industry and for the granting of wage scales calculated to make mining unprofitable.

This department is financed by a separate levy, but other large levies are made for the work of the local and national associations and these are many times bigger than the sums expended here in support of the National Coal Association. Certain it is that the union in this country rejoices in being able to use the papers to carry over to the public incorrect statements as to the situation and to do so with only trifling cost.

But, to return to Great Britain, twenty-five trained journalists work under the direction of Philip Gee and cover the many separate districts of England, Scotland and Wales. When any issue arises they are ready to discuss it intelligently and this they do by staging debates and in other ways. Letters are written to editors of the leading papers, and printed publications, each on some specific subject, are sent to the newspapers.

Conditions in the United States may not invite any such prodigious effort, but when one notes the mass of inaccurate and misleading information which passes muster for truth one soon realizes that its correction is too much to leave to busy men who have their mine duties to attend to. Organization is necessary and a program. The operators cannot allow a false record to stand. They must be judged on the truth and the truth alone. The mass of incorrect data, the twists given to the facts, the innuendoes of journalists with a false slant on public affairs should be met completely and promptly. An unanswered argument is regarded as unanswerable, and allowed to stand for a while becomes "incontrovertible truth." It gets its roots deep into the soil and is hard to tear loose.

For this reason the operators who want to get the public ear should get it early and should not rest till the idea is "sold." The public should know what is causing strikes—namely, the success with which the union gets what it goes after. No one should be allowed to believe that the anthracite operators seek, cause or foster strikes. The facts as to the closed mines, as to the distress of miners in union districts, as to the shifts in operating centers should be known. These stories should be told with good copy so that the man on the street who in the end solves every problem rightly or wrongly may not decide blindly and inadvisedly.

Recent reports appear to show that the activity of the mine owners of England in combating false statements is bearing fruit. The public is arranging a subsidy settlement that seems to suit both parties. To us is seems an ill-advised compact and one that bears unduly on the public purse. It is another approach to socialism, but it testifies to a desire on the part of the public to be fair to the mine owner even at the risk of being unfair to itself. This is at least an advance over the old method of asking the operator to shoulder the burden. The Britisher realizes at last that the mine owner must go under if he pays the high wage rate, because he cannot shift his burdens on the foreign consumer by charging a high price and because the present high cost of fuel is sapping the life of Britsh industry and reducing still further the available market.

## Those Who Run Machines Should Tend Them

BY AND LARGE, the same care is not being given by operatives to mine electrical equipment nowadays as was given in the early days. It is true, unfortunately, that the making by the manufacturer of each improvement toward the foolproofing of a piece of electrical equipment is accepted by the runner as a sign to let up, in a degree, on inspection and day-by-day maintenance of that machine. When machines were a novelty, the attendants took pains to minimize breakdowns. As the novelty wore away less attention was given to preventive maintenance.

The old custom, making the operative directly responsible for the condition of his machine, should be revived by every coal company. Those men in closest touch with the several types of machines—as runners of cutting machines, motormen on locomotives, foremen on tipples, and the like—should be compelled to attend personally to the cleaning, lubricating and making of minor adjustments during idle periods or at the end of each shift. Repairs or adjustments which cannot be made by these men should be reported promptly.

Manufacturers ought not to be blamed for faults which result from laxity on the part of the mine management. It is more than a coincidence that those companies which adhere to the old custom of preventive maintenance are least vexed with electrical and mechanical breakdowns.

# Long Tunnels Make Extensive Dip Workings Self-Draining

## Water from Adjacent Mines Led to a Common Discharge —Flooded Part of One Mine Caved to Workings Below —Old Shafts Utilized—Gravity Makes Drainage Positive

**By Frank H. Kneeland**
Associate Editor, *Coal Age*,
New York City

In most instances mine drainage is an unavoidable corollary to coal production. As a rule mechanical means must be employed to rid underground operations of excess water. If, however, the beds worked lie for the most part above the general water level of the region and the pitch is moderate and fairly uniform the force of gravity may be utilized to drain even an extensive chain or group of mines. Such conditions prevail in southern West Virginia, where, in some instances, foresight and good engineering have made it possible to almost entirely obviate the use of pumps, bailers and other water-handling equipment.

Two extensive gravity drainage systems, one of them with a tunnel nearly 7 miles long, have been installed by the United States Coal & Coke Co., the general office of which is located at Gary, McDowell Co., W. Va. One system is on the western or right bank (when facing upstream) of Tug River and Sand Lick Branch while the other is on the opposite bank. The first drains mines Nos. 9, 7, 6, and 2; the second drains mines Nos. 10, 3, and 1. The latter operation has been abandoned, at least, temporarily. Each of these systems encountered conditions and difficulties peculiar to itself and thus presented engineering problems of its own.

The total length of the drainage system on the west side of Tug River and Sand Lick is about 37,200 ft. In Fig. 2, the portions of the various mines connected by this drainage system are shown as well as the connection between them. Where a tunnel or drift is required for passage of the mine water this also serves as a means for the distribution of mine timber.

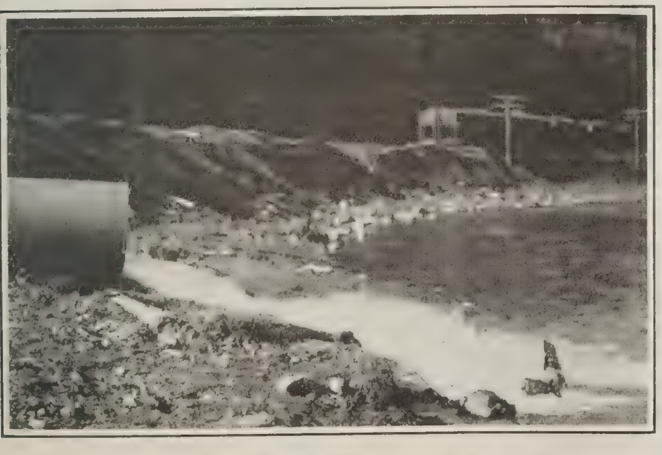

Fig. 1—Outlet of Larger Drainage System

Although variations in precipitation on the surface are reflected a few hours later in small changes in the volume of water escaping from this drain, it never fails. Year in and year out this stream of clear cool water finds its way to the Tug River.

Along Tug River and most of its branches timber has become scarce so that it is necessary to bring in a supply from Long Branch. This enters the mines at the point where the mine track crosses this stream. From here it can be taken to any point in mines Nos. 9 W., 7, 6, or 2. All workings in these mines are in the Pocahontas No. 4 bed and, consequently, tunneling through rock in order to obtain passage for the water is unnecessary. This drainage system, therefore, resembles an underground water shed with various branches and tributaries such as are found in natural water sheds on the surface.

The volume of water discharged from these workings is fairly uniform, seasonal changes making comparatively little difference in the rate of efflux from the outlet pipe. As this water shed embraces some areas in which the pillars have been drawn and the roof has caved to the surface there is a certain increased influx after heavy rains. It requires the lapse of only a few hours for this to reach its maximum.

Where the main watercourse traverses caved areas of this kind provision was made for keeping the waterway open before the pillars were drawn. To this end a ditch about 4 ft. wide and 2 ft. deep was dug in the mine floor. This was then concreted up the sides and over the top. When the roof caves over a ditch of this kind the fallen material "arches" over the top and the ditch cover has to support only a few feet of the roof rock. The ditch thus becomes a long aqueduct.

Mines on the opposite side of Tug River presented a drainage problem somewhat more difficult because here operations are carried on in both the Pocahontas No. 3 and No. 4 beds. The interval between these measures is about 65 ft., the No. 4 bed being uppermost.

Workings of mine No. 10 are in the No. 3 bed, those of mine No. 3 are in the No. 4 bed and those of mine No. 1, a shaft operation now abandoned, are in both beds. An old drift of this operation driven in the No. 4 bed comes out in the bank of Tug River slightly above the high water line. This has long been known as the Hood opening. It formed the logical outlet for the water from the mines on the east side of the river and the drainage system was planned accordingly.

The drainage system for these mines starts in the No. 3 bed in mine No. 10. The water is led through various workings in this operation until approximately the northwest boundary of the mine is reached. From here drainage headings were started to connect with the

---

The headpiece shows the actual mouth or outlet of the smaller drainage system from mine No. 1 in the bank of Tug River. After having traveled for approximately five miles underground by a decidedly circuitous path, involving at one point a vertical descent of about 65 ft. from one coal bed to another and an equal perpendicular rise up old No. 1 shaft, this water finally escapes to a stream on the surface.

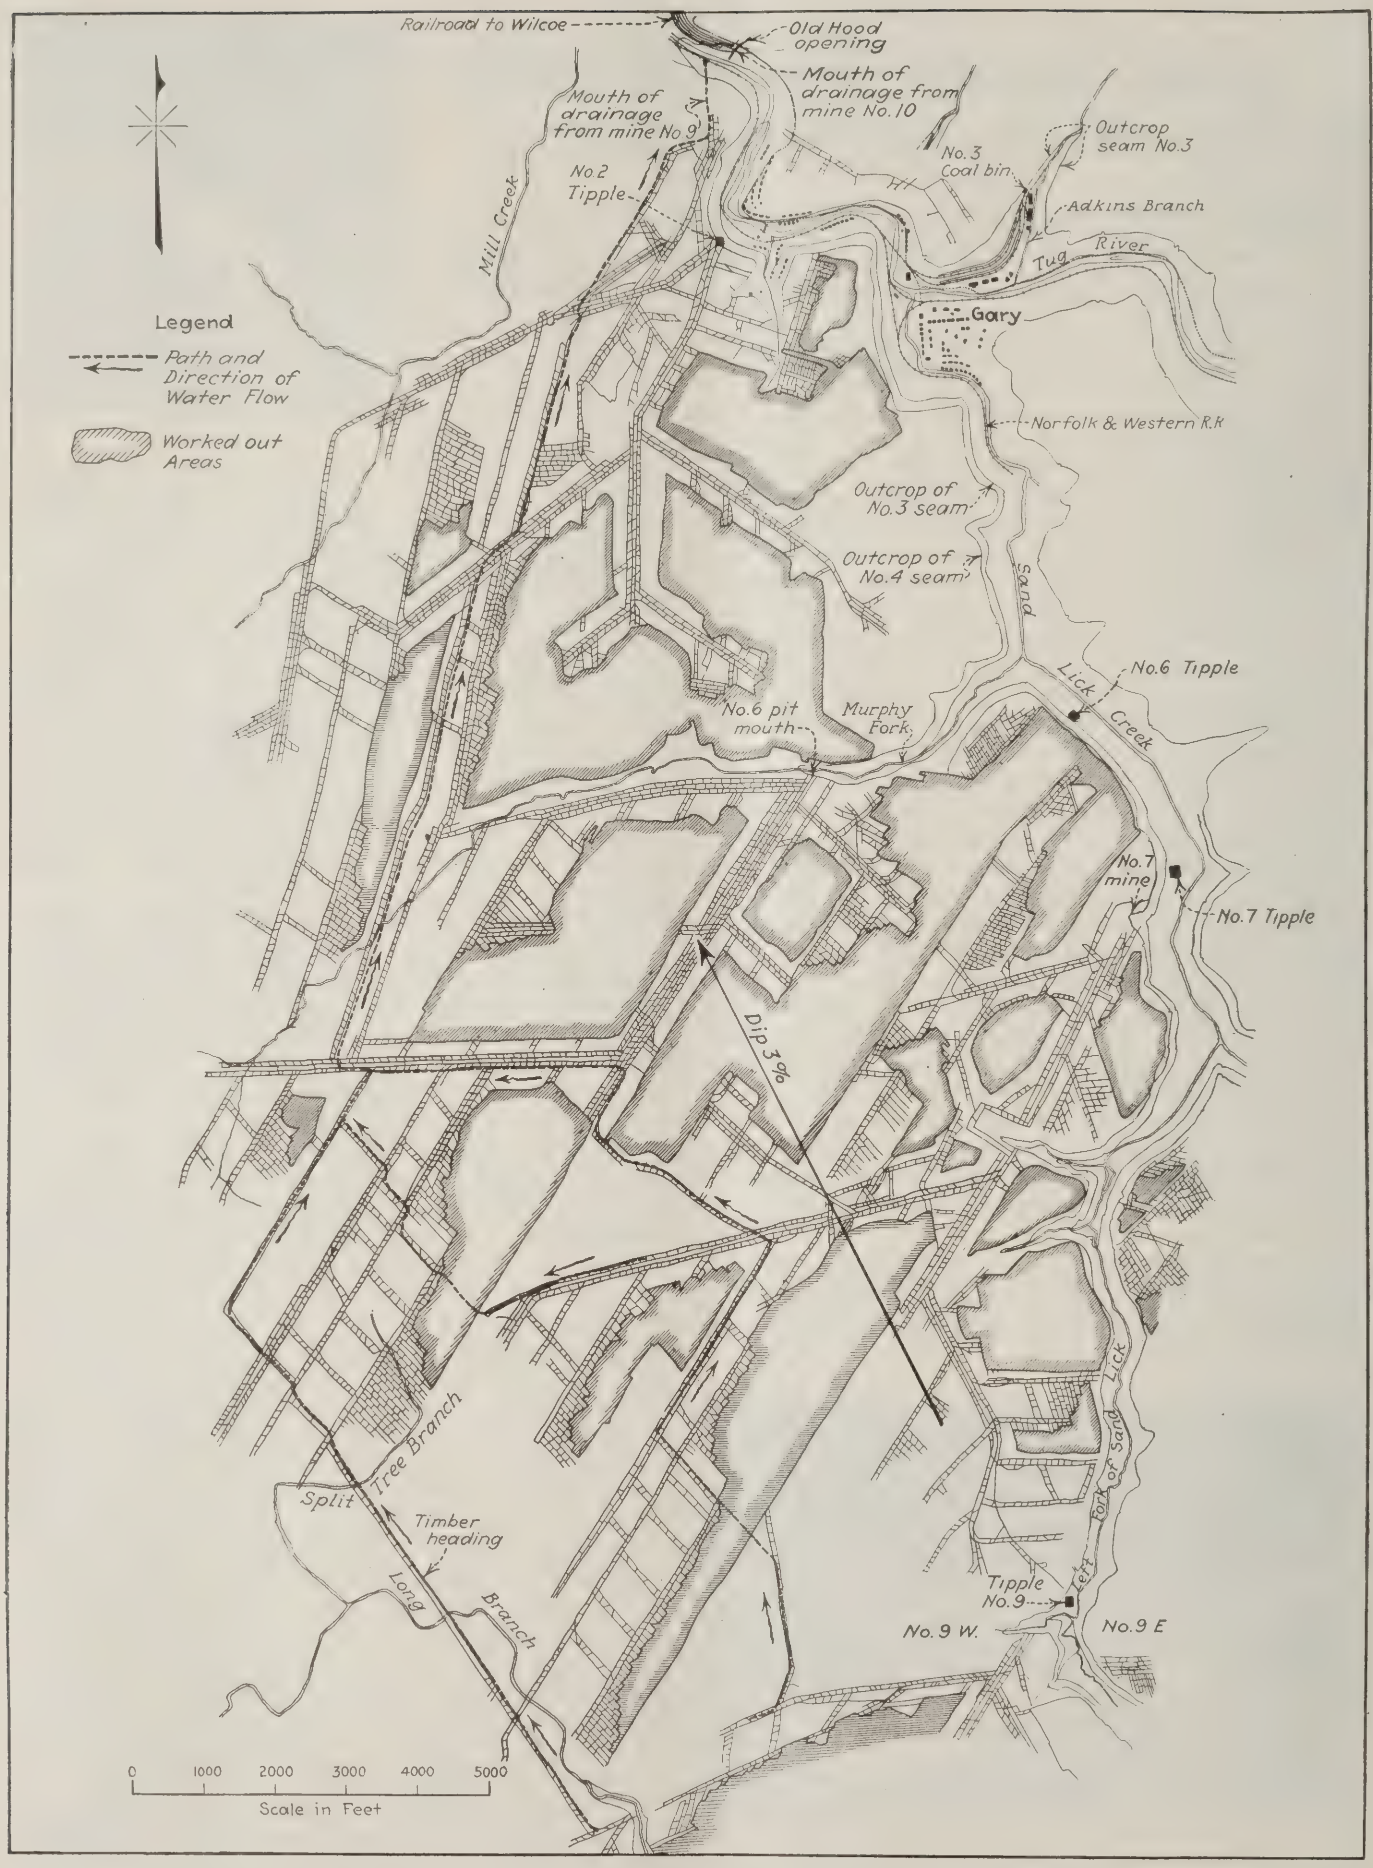

**Fig. 2—Drainage System Voiding Water from Four Good-Sized Mines**

It will be observed that the underground drainage here roughly parallels the natural drainage of the surface. Like the natural streams the one underground grows continuously throughout its entire length.

No. 3 bed workings in mine No. 1. These headings passed under the workings of mine No. 3.

When the drainage headings from No. 10 mine approached the No. 3 workings of No. 1 mine drill holes, or what might be called "feelers," were, of course, put into the coal ahead of the advancing faces. This proved to be an extremely wise precaution, for when these feelers holed through into the No. 1 workings marsh gas under pressure was encountered. It should be stated that No. 1 mine had been allowed to fill with water to the level of the Hood opening. The rise workings of this mine in the No. 3 bed thus were water-sealed, which accounts for the presence of the gas under pressure. This methane, however, bled off in the course of about 24 hr.

No. 3 mine contained two areas that originally had been driven more or less to the dip and had been allowed to flood. In order to drain the first of these, or what was known as the "J" mine, short headings were driven to a point (marked B in Fig. 3) below the lowest point in these workings. Here an area about 300 ft. square, or comprising approximately two acres, was worked out clean, the roof being supported meanwhile by means of heavy timbering. When this work was completed the roof supports were withdrawn and the strata between the two coal beds allowed to cave up into the old workings of No. 3 mine. Water from the flooded area thus was drained off in about 24 hr.

At a later date a rock tunnel was driven through the want or pinched-out area (marked C in Fig. 3). This allowed the water from the second flooded area to reach the headings leading to No. 1 mine.

Water from mines Nos. 10 and 3 enters mine No. 1 through the workings in the No. 3 bed. In this mine the shafts form the connection between the two coal measures. Up these shafts the water rises to the workings in the No. 4 bed, finds its way through the Hood headings and eventually escapes to Tug River through the Hood opening. The headpiece shows the actual discharge to the river. This is several feet below the rails at the mouth of the Hood opening. The tile thus was depressed in order to carry the water under a railroad track, which here is laid between the river bank and the Hood opening.

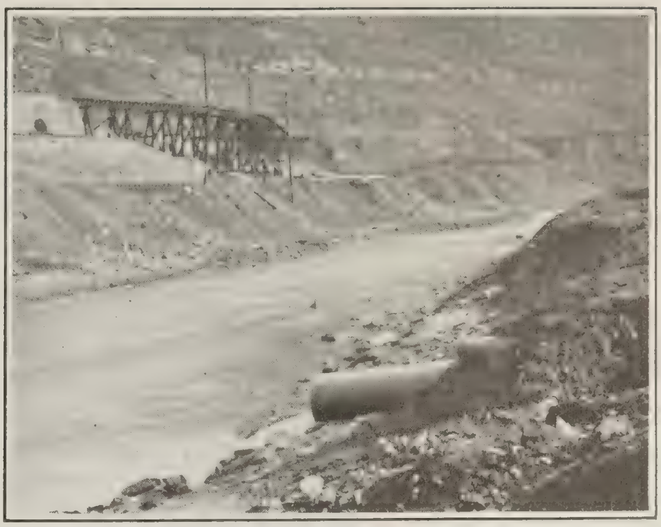

**Fig. 4—Downstream from the Lower Outlet**

In the foreground may be seen the outlet of the larger drainage system. The old Hood mine opening is across the river behind the larry trestle leading to the coke ovens. The actual discharge of the water to the stream is in the left hand bank almost in line with the end of the upper trestle.

Completion of these drainage systems has simplified the problem of dewatering the mines served by them. Every practical mining man hates to install a pump if its use can be avoided. This is not alone because of the cost entailed in pumping mine water but also because of the fact that any and every mechanical device, regardless of its kind or type, is less reliable than the constantly-acting forces of nature. Thus, gravity may be depended upon to operate day and night, in season and out of season, whereas such a device as a pump must be shut down occasionally for inspection or repair.

And, although all the workings of all the mines above mentioned cannot be unwatered naturally (swamps, swags, dips and swales are occasionally encountered which can be drained only by pumping) yet the United States Coal & Coke Co. uses fewer mine-drainage pumps today than it has at any time in its history. Furthermore, taken by and large, its mines are now more nearly free from water than ever before.

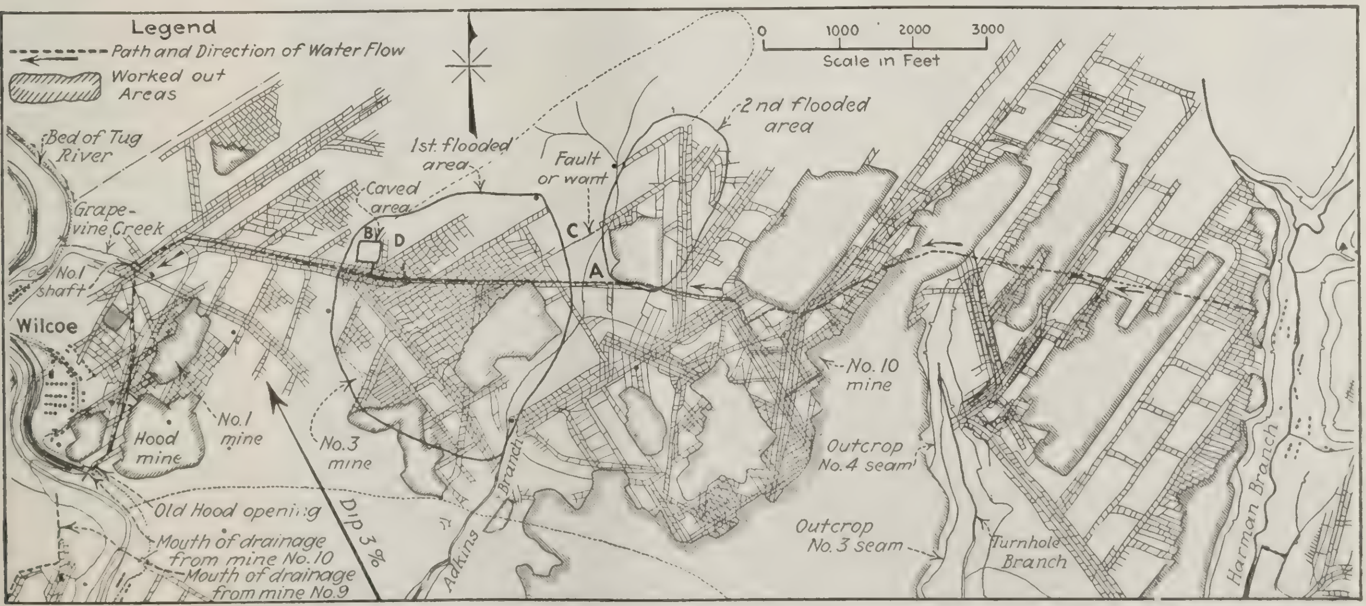

**Fig. 3—Draining Mines Nos. 10, 3 and 1 to a Common Outlet**

This system of drainage is particularly interesting because it lies partly in one bed and partly in another. At the point B the water from No. 3 mine descends from the upper to the lower bed through strata that have been purposely caved. It then proceeds with the water from mine No. 10 to No. 1 shaft, up which it rises and escapes to the surface through the Hood opening.

# Modernized Equipment Effects Large Savings

## Steam-Driven Apparatus Was Electrified Because It Could Be Operated Cheaper—Idle Day Losses Are Not So Heavy When Mine Is Equipped with Electric Drives

**By A. W. Spaht**
Electrical Engineer, Old Ben Coal Corporation, Chicago, Ill.

ECONOMICAL operation always is a major consideration in coal mining. It was the possibility of reducing the cost of producing coal that caused the Old Ben Coal Corporation to change its equipment from steam to electric drive. The company operates twelve mines in the Franklin County field of Illinois. The mines range from 3,000 tons to 7,000 tons daily capacity. A 33,000-volt transmission line, owned by the company, interconnects them all. This makes it a simple matter to operate the mines from a circuit having one main meter, thus giving the coal company the benefit of a large diversity factor. Also by arranging the schedule of operation of the various mines it is possible to maintain a comparatively high load factor based upon the maximum demand. This load factor was approximately 40 per cent last October.

The results of our modernization program obtained at No. 14 Mine are no doubt of general interest to the mining industry. This mine has a total lift of 519 ft. from bottom to dump. The average weight of coal per trip is 8,500 lb. Self-dumping cages are used, making 165 dumps per hour, or 700 tons per hour. The caging period is 4 sec.

The steam plant at this mine was a fairly modern outfit. Hence the contention that it was obsolete and should have been discarded cannot be made. It consisted of five water tube boilers having a total rating of 1,800 hp. Draft was furnished by a 200-ft. brick stack. The boilers were equipped with mechanical stokers, bunkers, and coal conveyors bringing coal directly from the tipple to the boiler plant. A suitable feed-water treating plant with filter, and feed-water heaters were provided. Steam pressure of 165 lb. gage, was carried. An ash blower took the ashes directly to railroad cars.

The hoisting engine was a 28x48-in. first motion unit with a 9-ft. cylindrical drum. The fan was driven by an 18x24-in. direct-connected, 4-valve engine. The exhaust from the hoisting engine and from the fan engine was used in a 500-kw. low pressure turbine for generating electric power for the mine locomotives and cutting machines. In addition to the turbine-driven generator there were two units, one a 250-kw. and the other a 200-kw. machine driven by direct-connected 4-valve engines.

The mine is now entirely electrically operated. The hoist with all its electrical equipment was designed and manufactured by the Allis-Chalmers Manufacturing Co. The hoist is equipped with a main direct-connected direct-current motor and an auxiliary alternating-current geared motor.

To show the brake operating mechanism and safety devices more clearly a view of the No. 12 hoist is shown in Fig. 1, which is a duplicate, except that it is of the opposite hand from the No. 14 hoist. The hoist drum is of the cylindro-conical type, being 6 ft. 6 in. in diameter at the small ends and 11 ft. 6 in. in diameter at the center. It is served by a parallel-motion post brake 10 ft. in diameter with a 12-in. face having structural steel posts. The brake is of the gravity type set by a weight and released by an auxiliary oil operated brake engine. The brake engine is free from objectionable leakage so that drip pans are not required.

An interesting feature of the brake engine is that the

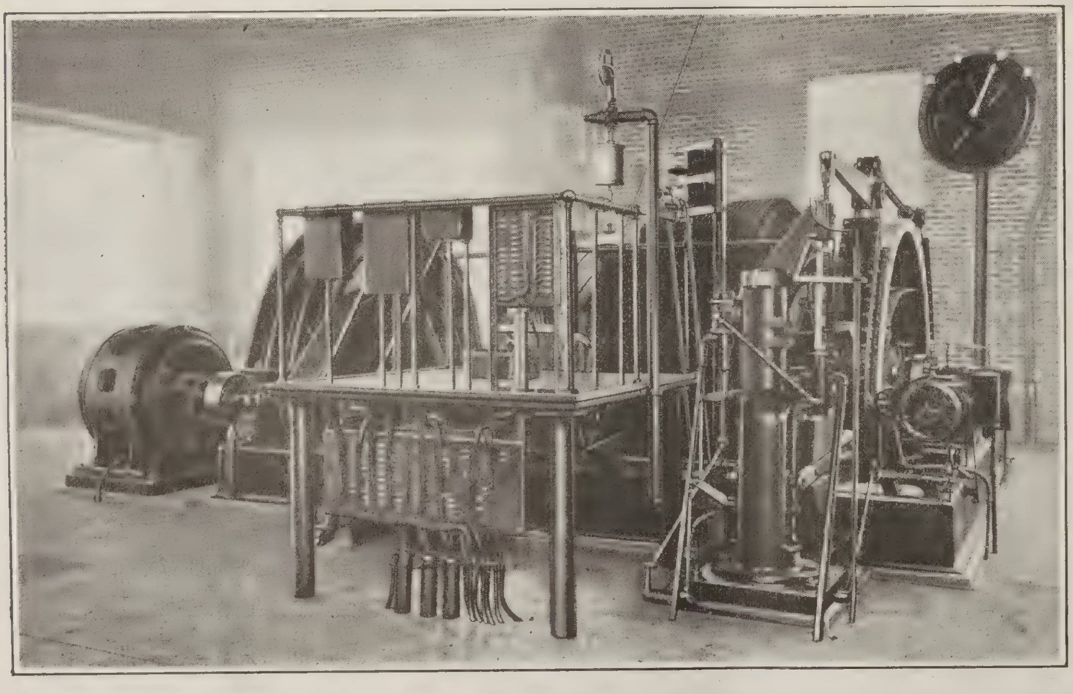

FIG. 1

**Two-Motor Hoist**

The main motor of this hoist is a direct-current unit which receives energy from a motor-generator set. For emergency purposes and for idle-day service an alternating-current motor is connected. Special safety features make it impossible to operate the two motors at once. An accident is a remote hazard.

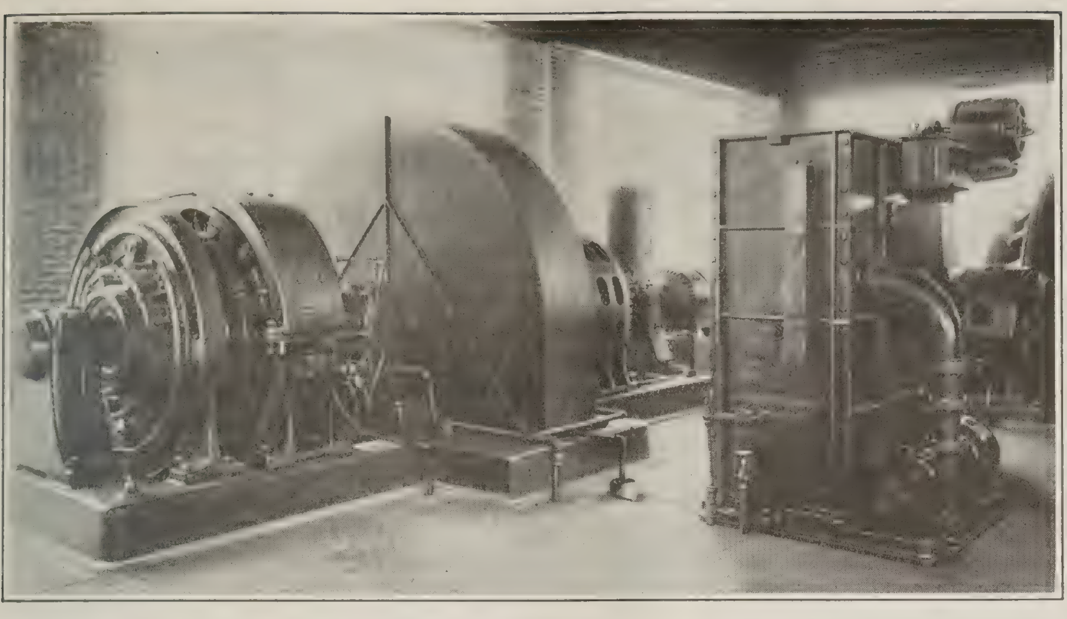

FIG. 2

**Power and Control Apparatus**

This picture shows the 800-kw. motor-generator set and liquid slip regularly used with the No. 14 mine hoist. The steel plate flywheel on the set weighs 22,000 lb.

auxiliary valve, which acts in connection with the safety devices to automatically apply the brake, is operated by both a direct-current and an alternating-current solenoid each functioning entirely independent of the other and so arranged that complete safety protection is afforded when the hoist is driven by the direct-current motor or the alternating-current motor. The oil pressure system provided for the operation of the brake is so designed that it eliminates all glands and stuffing boxes, valves, etc., and is neatly and cleanly installed.

The direct-current motor is rated 1,100 hp., 72 r.p.m., 600 volts. The power for this motor is taken through a motor-generator flywheel equalizing set consisting of a 750-hp., 720-r.p.m., 2,300-volt alternating-current motor, an 800-kw., 600-volt direct-current generator, a 22-kw., 250-volt exciter and a 22,000-lb. steel plate flywheel 10 ft. in diameter. Fig. 2 shows this set, together with the starter and automatic liquid slip regulator. Exceptionally close power control is obtained on the flywheel set with this regulator. The set can be stopped in case of an emergency in a little over 2 min. with the current inrush approximately equal to full load current.

The 300-hp., 2,300-volt alternating-current auxiliary motor is provided for driving the hoist at night or on idle days. Special interlocking arrangements are provided so that the pinion which meshes with the drum gear must be entirely out of mesh before the main direct-current motor can be operated and the pinion must be completely in mesh before the auxiliary alternating-current motor can be operated. It is absolutely impossible to operate the control circuits for both motors at the same time.

Fig. 3 shows the complete station switchboard. An interesting feature is that in addition to the panels for the control of the main alternating-current and direct-current circuits to the flywheel set the contactor panels for the main direct-current motor and the alternating-current motor are incorporated in the switchboard. Power for the locomotives and cutting machines is pro-

FIG. 3

**Switchboard Control**

Both hoist motors receive power through this switchboard. The contactor panels in the middle of the switchboard control the alternating-current motor. Direct-current circuit breakers on the mine feeder are shown in the foreground.

vided by two synchronous motor-generator sets, one of 500 kw. capacity and the other 300 kw.

The electrical energy taken by this mine last October was 447,050 kw.-hr. This includes the line and transformer losses which are borne by the coal company and charged against the cost of power. This figure enabled us to determine that 5.11 kw.-hr. was used per ton of coal hoisted. This figure when properly distributed, was as follows: Main hoist, 0.95 kw.-hr.; auxiliary hoist, 0.06 kw.-hr.; fan, 1.64 kw.-hr.; motor-generator sets for cutting, hauling and pumping, 2.20 kw.-hr.; main screens, shop, car-pullers, and yard lighting, 0.26 kw.-hr. The hoisting equipment takes 0.77 kw.hr. per ton when hoisting steadily. This is 2.52 per cent less than calculated. The men are lowered into the mine and taken out with the main motor which causes the kilowatt-hours per ton taken by the flywheel set to be greater than 0.77 kw.-hr. The auxiliary motor saves over 20,000 kw.-hr. per month. This motor is used for night and idle day hoisting. It has sufficient capacity for handling a loaded car, and could be used for hoisting coal in case of trouble with the main motor. The daily tonnage would, of course, be greatly reduced.

The hoist is equipped with the following safety features: overwind protection; overspeed protection; automatic acceleration and retardation; slow speed control of main motor for man hoisting; an emergency switch at the ground landing for stopping the hoist in case the engineer starts the hoist in the wrong direction when handling men; automatic stopping in case of power failure. After an emergency stop the brake lever must be placed in the "set" position and the controller brought to the "off" position before the brake can be released.

The power costs at the Old Ben mines include the cost of purchased power, maintenance of transmission system, losses in transmission system, maintenance of transformer and converter stations, and switchboard attendance. When steam was used the boiler room labor and maintenance, fuel supplied, the piping system maintenance, engine and generator maintenance, and switchboard attendance were included. The switchboard attendant was usually the oiler for the engines.

While the plant at the No. 14 mine has been in operation only a few months, the indications are that the annual saving in power costs will be more than $50,000. An important part of this saving is due to the possible reduction of idle day costs with electric operation. The curves in Fig. 4 show how the power cost per ton varies with the number of days worked per month, or the running time. These curves compare a typical steam operated mine, with an electrically operated mine. The records are given for a period of thirteen months, from January, 1923 to January, 1924 inclusive. The same vertical scale is used in both illustrations.

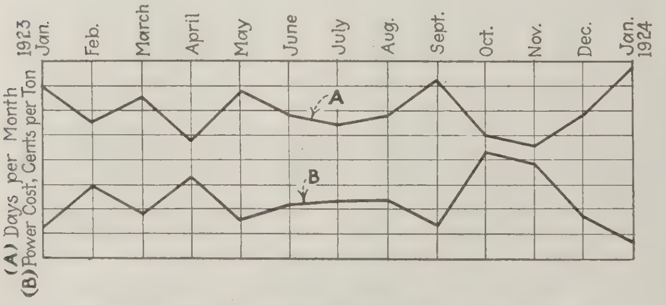

**Fig. 4—Steam Operated Mine Increases Costs**

Power costs per ton mount to high figures when output of mine is low. Curve *A* shows the number of days operated per month. Curve *B* shows power costs per ton.

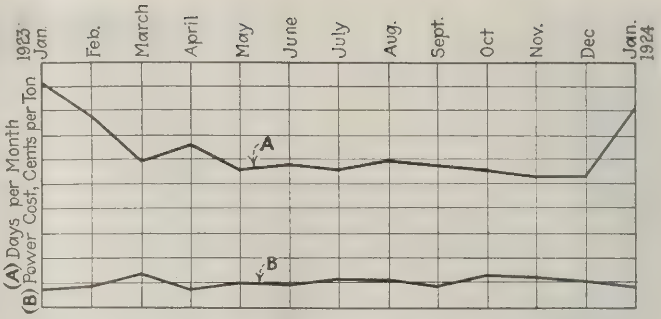

**Fig. 5—Electric Operation Reduces Costs**

Costs for electrical energy remain about the same even though the number of days operated per month vary between wide limits. The number of days operated per month are shown by curve *A*. Note how straight is curve *B*, representing power costs per ton.

It must be understood that these curves may not apply to every mine. For instance, where pumping or ventilating is the major part of the load, the idle day costs will vary more than shown. On the other hand, if pumping and ventilating is less than at the mines illustrated, the curve should vary less. But the important fact clearly stands out, that with electric operation the idle day costs can be kept under better control than with steam driven equipment. There are no boilers and steam engines that must be repaired on idle days or nights. Our experience shows the electric hoist requires less repairs and less "time out" in regular daily operation, than steam hoisting equipment.

## Experiments May Aid Indiana Coal

A thorough series of investigations and experiments with Indiana coal have been started by the engineering experiment station of Purdue University, the results of which are expected to prove of great value to users of Indiana coal. The work is being carried on under the direction of Dr. A. A. Potter, dean of engineering and director of the Purdue engineering experiment station. The following are actively engaged: Prof. A. W. Cole, Prof. J. L. Bray, W. E. Gray and J. P. Walstead.

Particular attention is being given to the steaming qualities of the coal. Boiler tests are being made at various industries using a variety of firing methods, including mechanical stoking, and all types of furnaces. Representative samples of Indiana coal are being taken from Indiana concerns and are being analyzed chemically. Professor Bray, a mining specialist with over ten years of experience with North and South American coal products, is making a critical study of mine methods used with a view of giving to mine owners the benefit of his long experience.

The investigation is entirely a fact-finding process and no opinion will enter into the investigations. Coal from practically every mining district in the state is being used, and it is the aim of those in charge of the work to set forth what can be expected from Indiana coal for steam generation. It is hoped that the results of the work may be published as a bulletin of the engineering experiment station. The Purdue men feel that Indiana coal compares favorably with the product of other middle western states, but that it is a question of proper furnace design and engineering knowledge that must be solved to utilize the Indiana product most efficiently.

# Operating Records Aid in Designing New Layouts

**By O. E. Kenworthy**
Field Electrical Engineer, Lehigh Valley Coal Co.,
Wilkes-Barre, Pa.

MANY LARGE POWER companies today have in their files records of the performance of practically every piece of electrical equipment in their service. Together with this they have cost and maintenance data with depreciation rates charged against each piece of electrical apparatus. Such records tell at a glance the value of each class of equipment.

Wide-awake manufacturing companies who have to depend largely on the continuous operation of their machinery keep constant records of the performance of all their equipment. These data include, primarily, a study of the main driving units or the real "works" of the apparatus. The records these companies obtain are their experiences. When the time comes for expansion of their plants the engineers in charge are able to cope with the problems easily and can make proper decisions relative to the exact equipment necessary to handle the job.

The keeping of such records and the compiling of statistics of the cost, maintenance and depreciation of electrical apparatus is just as important to these companies as the cost accounting done on the materials which they manufacture.

With this in mind let us turn to the coal mining companies. In the application of electricity to mining much thought has been given to the design of equipment for the service to which it is applied. Some valuable data have been collected and compiled in convenient form for the use of electrical engineers, and others connected with coal companies, relative to the operation of practically every type and make of mine locomotive, pump, fan, hoist, motor, coal cutter and electrical control apparatus in general. However, in most cases this information has been gathered by the manufacturers of the equipment. Due to the belief that mining is, in a general sense, a hazardous occupation, much electrical equipment has been installed in what might be termed a haphazard manner, with the belief that anything "gets by" in the mines. One must not, however, take the latter statement too seriously, for every mining enterprise has its own problems and individual solutions.

However, the following may be said with impunity: The application of electricity to mining is becoming of such importance and magnitude that it behooves electrical men in the mining field to make a careful study of their conditions. They should record whatever information is obtainable in such a manner that when necessity arises the figures so compiled readily can be used in not only estimating new work but in showing up the proportionate cost per ton of the operation and maintenance of different pieces of electrical equipment.

As an example of what may be done, let us consider the matter of feeders for haulage purposes inside the mine. In installing new equipment to electrify a haulage road, most engineers, I believe, will figure the requirements from a purely engineering standpoint or by good use of their memory install equipment similar to some other installation assumed to be giving satisfactory service. The difficulty with this is that due to uncertain conditions, pure engineering is not always applicable nor is a good memory always sufficient. Feeders may be installed that are too large, thereby increasing the initial cost; or they may be too small, increasing the copper loss. Also, the generating equipment may be of such capacity that for the diversity factor obtained more money is expended for such machinery than is really necessary.

Following along this line of thought I have in mind an installation of this kind that is worth while con-

**Feeder and Trolley Layout of a Mine Having a Large Connected Load Shows How Distribution and Load Factors Make Possible the Use of Smaller Feeders**

Rarely, if ever, do all the motors in a mine draw full load current from the generators at the same time. This especially is true when large numbers of locomotives are used. Peak loads sometimes come on the lines in relays which indicate the movement of large trains of cars periodically started and transported to the mine opening or shaft.

**Automatic Circuit Breakers Function in the Most Advantageous Locations**

No one thing has contributed more to the efficient and successful operation of mine feeder and trolley systems than automatically controlled circuit breakers. Their use has, in most instances, increased the load factor of circuits and machines, thus enabling each piece of apparatus to work full time and cut costs.

sidering. At one of our mines two motor-generator sets, each of 200 kw. capacity and 275 volts are installed. From the substation the feeder drops down a 400-ft. borehole within 20 ft. of the building. From the foot of the borehole the cable continues for a distance of 3,670 ft. along the main gangway. For a distance of 2,510 ft. from the foot of the borehole this feeder is a 1,250,000 circ.mil rubber-covered wire. For 1,310 ft. it is 1,000,000 circ.mil rubber-covered wire and for 840 ft. it is a 500,000 circ.mil cable. Taps are made into the trolley at various points along this feeder and at other places branch feeders run off to hoists and pumps. The accompanying drawing shows diagramatically the layout of the feeder system at this colliery. The diagram by no means attempts to show the relation of roads or gangways or the location of equipment but is purely a schematic arrangement.

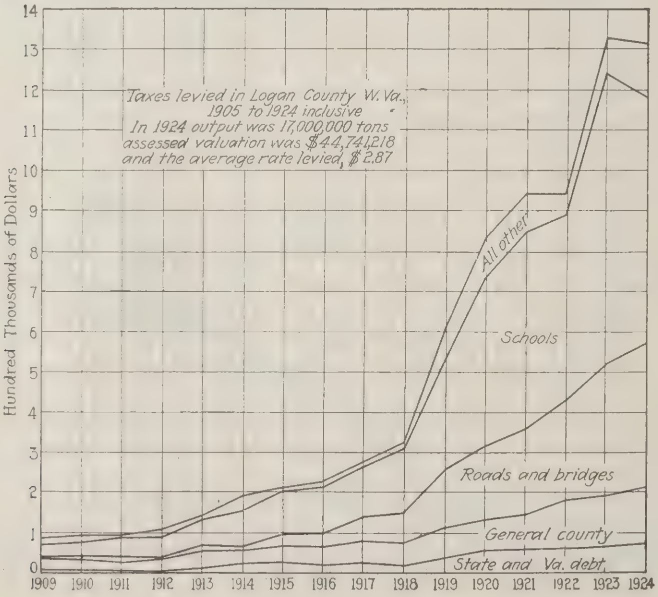
From the diagram it can be seen that there is a 662-hp. connected load consisting of locomotives and 187 hp. of hoist loads. A few pumps also are shown but adding a number of small dip pumps the total connected horsepower for pumps is 222. There is also one air compressor of 40 hp. capacity. This makes a total connected horsepower load of 1,111 or a possible full load current of about 3,500 amp. The main circuit breaker in the substation is set at 1,900 amp. and each machine breaker is set at 1,000 amp. The normal load on the station is 1,500 amp. One can see the diversity factor is fairly high. Again, observation has proven that the cables installed here are satisfactory from several viewpoints. One is that the voltage is good throughout the mine. Another is that the temperature of the cables does not rise appreciably except at times of peak loads. Even then it is barely noticeable by touching them with the hand.

It seems to me that if every operation were laid out in this manner and suitable data collected, we would soon have reliable information compiled from which good estimates could be made for new or additional applications. It is merely the purpose of these remarks to point out what can be done along such lines and show how practical operating results must be considered when using engineering theory.

---

## Taxes in Logan County, W. Va., Are Sore Problem to Coal Men

Speaking on taxation at a recent luncheon of the Huntington chapter of the American Association of Engineers, A. J. King, president of the Aracoma Coal Co. and associated companies, made public some figures which typify the burden of taxation on coal mines. He said one operation, opened in 1911, and which declared the first dividend in 1913, has paid in dividends up to 1924, $310,000. In this same period there has been paid to the government $359,000, and it is now asking for $24,000 more. By way of comment Mr. King said this operation is considered a good one.



Another mine, opened in 1917, has paid the stockholders $120,000 in dividends and the government $123,000 in taxes. From this mine the government is asking for $24,000 more. A third mine, opened in 1914, has paid the stockholders $5,000 and the government approximately $43,000. The accompanying chart shows the proportional division of coal taxes for all Logan County, W. Va.

## Ash Binds Coke and Modifies Byproducts

Coal that is too clean is of a friable character, and possibly the coke also that is made from a clean coal is likely to lack structure. Certain it is that some of our strong cokes are relatively high in ash, and it may be surmised that the ashy constituents have part in the creation of that crushing strength. Cobb and Marson have found that oxide of iron added to coal before coking gives coke that is smaller in bulk, more compact in structure, more finely porous and more resistant to crushing than that obtained from pure coal. This fact they enunciated at the meeting of the Institution of Gas Engineers in Great Britain. Caustic alkali, on the other hand, destroyed the coking properties, though sodium carbonate gave a compact, finely porous coke particularly resistant to crushing. The authors declared that the volatile matter left in the coke prepared at 500 deg. C. was considerably greater in a coke made up with oxide of iron than with pure coal. Dr. Lessing did not believe the quantity of gas that distillation of a coal would afford was affected by the percentage of ash, but the quantity of tar produced from the coal was influenced markedly, also the yield of byproducts, the kind of coke and the thermal value of the liquid products.

# Company Educates Its Men To Cut and Shoot Better

## New River Co. Gets More Lump, Makes Mines Safer and Miners Proüder of Their Workmanship As Result of Better Methods

**By C. P. Anderson**
Chief Inspector, New River Co.,
Macdonald, W. Va.

C. P. Anderson

THE shooting and cutting of coal necessarily varies so widely in different seams and under different conditions that no set of rules can be laid down for all companies. However there are methods of encouraging proper shooting that can be applied anywhere. The experience of the New River Co. in conducting a campaign among its men for better shooting to get more lump coal may be helpful to others. We not only raised our proportion of coarse sizes and increased our factor of safety but, best of all, we succeeded in making our men proud of their work as miners.

Several years ago we decided that we must have a bigger percentage of lump. We called on powder companies to furnish us with demonstrators. Also we used one of our foremen who had been connected with a powder company as salesman and demonstrator before coming with us. We made him explosives engineer. The first thing we did was to go over the fifteen mines, analyzing conditions of each separately, trying out different kinds of powder, and seeing how each would work under various conditions. We also tried out our machines to see how to cut to best advantage. We then laid down a set of rules which were put on a blue print with drawings showing how places should be cut and how holes should be placed.

After deciding what to do, we realized that the idea must be sold to our officials. So, after staying at a mine all day, we had meetings of the mine officials at night explaining to them the necessity of obtaining lump. We discussed all the mistakes we had found in the practice at this particular mine. We furnished each of the officials with a blue print. These loyal men went out with the determination to improve the quality of the coal from their mines.

The next thing was to sell the idea to the machine men, miners and all other employees. In addition to showing them in the mine what to do, we called meetings of the employees and explained the necessity of more lump, going into the details of our rules and asking the men to state their views. At these meetings we picked up quite a lot of information and absolutely sold the idea to the employees.

Some of the bad practices we had found were: Machine men cutting off the bottom and gripping ribs; miners shooting with no system, using an over supply of powder and not cleaning bug dust from under cuts; improper tamping, and disregard of safety rules.

### INSTRUCTING THE MACHINE MAN

The first man to deal with was the machine man. The struggle was to get him to keep his machine on the bottom and cut straight ribs. (Practically all of our machines are shortwalls.) The great objection to the machines gripping is that the miner has a tendency to point his shot holes correspondingly and such holes require more explosives. This shatters the coal. It is surprising to know how many excuses machine men can find for not cutting straight ribs; but after all straight cutting requires only a little more work and possibly the setting of extra jacks.

The next man we had to look to was the miner. Under our plan his first work is to clean the bug dust under the cut. For this, we make him use a long-handled shovel. After this dust is cleaned out it is loaded. He then places his holes. In wide work he drills a hole at an angle to both rib and top and 12 in. from the back of the cut. When the hole is ready, he places his shot. As he uses permissible explosives and electric detonators, the detonator is placed in the center of the charge and the full charge of powder is moved to the back of the hole.

Dummies are filled with clay. The first two are

---

This article is from a paper read by Mr. Anderson at the Peoria (Ill.) convention of the Mine Inspectors' Institute of America, May 19, 1925.

**Here Are Some of the Results of the New River Co.'s Campaign for Better Mining**

On the left is a coal face that has just been "busted" with a breaker shot. In all narrow work one of the rib shots, drilled in straight and 12 in. from the rib, must be fired as a breaker shot. In this illustration is shown the coal after this shot has been fired. On the right is the same coal face after the coal has been pulled down following the rib shot.

pushed in easily and the next are tamped firmly to the mouth. This is done in order to get as much air spacing as possible. After this shot has been fired, the miner must load all coal out, then clean dust or coal from under the ribs and shoot one shot at a time. All rib holes must be drilled straight, 12 in. from the rib and 9 in. from the back of the cut. In narrow work, one rib shot is used as a "breaker."

In starting on this work we used 1¼x8 in. powder and bore holes 1¾ in. in diameter. In order to get more air space we increased the size of the auger bit to 2 in. Later, we cut down the size of the cartridge to 1⅛x8 in. After we had used this for a while we decided that miners were using more powder than was necessary. We then cut the size of the cartridge down to 1x8 in. This is the size we are now using. By standardizing on 2-in. bore holes and 1-in. powder we have reduced the amount of explosives and increased the amount of air space.

It is often said that miners will always put too many sticks in a hole. We are convinced that even if they use more explosive than is called for under the rules, it will increase the air space and give us lump coal just the same. By doing this we are able to control the air spacing by having the blacksmith control the size of the auger bit and by furnishing miners powder cartridges of the size we want them to use.

The next question is how to keep check on whether our rules are being carried out. We have daily reports showing the percentage of coal we are getting and at the end of each month we take the actual weight of railroad cars and figure monthly percentages. The officials of each mine are held responsible for the showing their mine makes. Our explosives engineer makes trips to the various mines, seeing that rules are complied with and he makes a written report on each mine. It is well to mention here that we have had reports from different mines where there were *no violations* of our rules. In addition to making his report, he talks to all the miners and offiicals, showing them what should be done and trying to keep everybody interested in the quality of our coal.

Some of our mines are non-gaseous, but we do all shooting with electric detonators and make miners use cables 100 ft. long. There are two reasons for using electric detonators. Safety is increased and we believe that because of the cost of electric detonators, miners will make each shot do its full job. With caps and fuse, we found miners were inclined to put in a number of pop shots which resulted in a very poor quality of coal. We furnish clay for all tamping and make miners use wooden boxes for carrying detonators and fiber canisters for powder.

The results we have obtained are gratifying. Today we are getting a good percentage of lump. Also we have a well-trained force of men and a record of so few accidents in handling explosives that we feel our efforts have not been in vain.

### Must Overcome Skepticism

Starting a program of this kind is like introducing anything else that is new. Miners are skeptical and must be shown that it means money to them to get a better product which results in better running time, and they must be shown that old methods must be done away with and up-to-date methods used. The thing that makes me feel best about our program is this: When I take anyone to the mines to show them our coal, all of our miners try to show how much pains they take to prepare their coal. They are getting proud of their work.

The trouble with most operators is that when times are good they forget this phase of the business, but when times are hard, they worry their men. Lump cannot be obtained this way. The need must be kept before the miners day after day and year after year, in good times as well as in bad. And above all, company officials must stand squarely behind the men charged with the duty of running this day-in-and-day-out program, just as they have done in our company.

## Creosote May Make Mine Cars Last Longer

Finding that the wood in mine cars is affected by dry rot when the cars are left idle, the Hillman Coal & Coke Co. is treating such wood with a preservative fluid of the creosote type with the hope of effecting a considerable saving.

# Miners Smash Anthracite Negotiations

**By Sydney A. Hale**

Special Contributor, *Coal Age*
New York City

Atlantic City, N. J., Aug. 4—The anthracite wage conference broke up today. Adjournment sine die was taken because the operators declined to reconstruct their sub-scale committee to suit the wishes of the miners. President John L. Lewis last Friday in a letter to S. D. Warriner, chairman of the Anthracite Operators' Conference, demanded that Mr. Warriner and S. J. Richards, veterans of former years of negotiations, assume seats on the sub-scale committee on the ground that the existing committee was made up of "supernumeraries" who had power to agree to reductions in wages but nothing else. Mr. Warriner on Monday insisted the operators' representatives were clothed with full power and declined to meet Mr. Lewis' demand.

In a long statement Lewis asserted the operators wanted to reduce wages in order to increase profits and accused them of blocking every constructive suggestion to cut the cost of coal to the consumer. He said the operators' refusal to join the miners in asking the Interstate Commerce Commission to start another freight rate investigation bolstered up the charge. He attacked the operators for not submitting statements of administrative expenses when the miners demanded them. He renewed his charge that the operators will profit largely by a strike in spite of their claims that prices will not be increased at mines and said the public is already paying through the nose in higher prices since Aug. 1.

Lewis said the miners object to arbitration because "we have had previous experience with arbitration with operators. The anthracite mine workers have lost $60,000,000 a year in wages over a period of two years to acquire the knowledge they now have concerning the anthracite operators' well known policy of keeping close to the arbitrators."

After Mr. Lewis had finished his letter which closed with the declaration that the miners "are of the judgment that it is utterly futile to continue further these scale negotiations" the operators present retired for a private conference.

When they returned to the committee room they asked Mr. Lewis this question: "Are we to understand from your letter that in view of our opposition to an increase in wages and the check-off you refuse to continue negotiations?" The miners finally admitted that that was their position.

The operators then asked whether in view of that answer the miners were willing to submit the matters in dispute to arbitration. In reply the miners referred them to Mr. Lewis' letter. The adjournment of the joint subcommittee sine die followed on motion of the miners.

The next step is a matter of speculation. Washington or Harrisburg may seek to bring the joint committee together again. Although no statement of any kind has been made by the operators it is known that any proposal to have Governor Pinchot again intervene as he did in 1923 would meet with their violent opposition.

The July 28 session opened with an attack upon the advertising campaign inaugurated by the operators to tell the public that a suspension Sept. 1 was indefensible because the producers were ready to arbitrate if direct negotiations failed. The miners seemed to assume that the "gigantic sums" so expended ought to be applied to wage increases. Operators declared the advertising costs would represent less than 10c. a year on the pay envelope of each worker in the mines. They said the expenses would not be a tax upon production cost but upon profits and represented far less than the loss due to a single day's suspension.

The miners wanted to know all the items entering into the cost of production and what these items meant in percentages and in actual dollars and cents. The operators' statement that the miners' demands, if granted, would increase the price of domestic coal at the mines $2 per ton did not set well with the union members of the committee, although the figure was not directly challenged.

After further inclusive discussion on arbitration and the restriction of output, the subcommittee began a consideration of demand No. 3, which was not laid aside until Thursday. This demand in part reads as follows:

> We demand uniformity and equalization of all day rates and that the consideration rate of each colliery shall be equivalent to the average daily earnings of contract miners under normal conditions and that for deadwork performed by the contract miner he shall be paid this consideration rate; and that skilled mechanics, such as carpenters, blacksmiths, etc., shall be paid the recognized standard rates existing in the region; and that engineers and pumpmen who do repair work on their engines and pumps shall be paid the recognized mechanics' rates for this repair work; that first-class hoisting engineers shall be paid a more substantial rate of wages in keeping with the responsibilities and nature of the work; and that all daymen shall be paid time and one-half for overtime and double time for Sundays and holidays.

Although the question of uniformity has been before the operators and the miners for several years, no definite action has ever been taken. The old rates upon which the 1903 award was based were the fruits of independent, individual bargaining between employer and employee. Each succeeding adjustment has added flat or percentage increases to those rates. As a result of this crystallization, twenty-three collieries in the Lehigh district, for example, pay thirty-seven different hourly rates ranging from 58.7 to 75c. per hour to carpenters; twenty-four collieries pay twenty-one rates ranging from 57.7 to 75.6c. per hour to trackmen.

In their demand for equalization and uniformity the miners have lifted the so-called skilled workmen in crafts not peculiar to coal mining out of the general group of day workers and insist that these special classes receive the same hourly rates as are paid to craftsmen in the same line in outside industries in the region. Taking carpenters as typical of these special groups, the miners assert that the carpenter in the building trades earns as much in 200 days as the mine carpenter does in 300 days.

The operators answer that the mine carpenter enjoys continuous employment; the outside carpenter, intermittent work. They cite the fact that in the fall and the winter these outside carpenters receiving an hourly rate approximately 50 per cent higher in the building trades apply for work at the mines despite the disparity in hourly rates. The miners take issue on the claim of intermittency, contending that the outside carpenter enjoys practically full-time employment.

In explaining their position with respect to equalized rates for day labor peculiar to the coal industry spokesmen for the miners say they are limiting their demand to uniformity in rates for the same class of labor in the same colliery. In other words, at this stage they are not attacking, for example, the fact that sixty-five collieries in the Northern district have fifty-two different rates for jig runners or that twenty-seven mines in the Southern district have thirty rates for stablemen and eighteen operations in the Middle field show sixteen different rates for tracklayers. What they are attacking is the existence of two or more rates for ostensibly the same class of labor in the same colliery. That these variations, where they may exist, represent relative skill is a possibility not considered.

The miners' idea of the solution of the situation is to raise all the rates for the same class of labor to the highest rate paid for that work by the individual operation involved. Each separate colliery, as distinguished from each separate operating company, is the unit upon which they propose to work.

Consideration of this demand is complicated at the outset by a dispute as to the responsibility for the failure to bring this question to a head before this time. The demand itself is not new. In 1920 the miners asked that "a uniform wage scale be established so that the various occupations of like character at the several collieries shall command the same wage."

The Anthracite Coal Commission directed that the Board of Conciliation make a study of the situation and report to the joint conference not later than March 31, 1922, when the contract based on the Commission award expired. This study has never been made because all the rate sheets of the individual collieries have not been filed with the Board. The miners allege that the operators are to blame for this. The operators heatedly retort that the refusal of certain local unions to join with them in certifying rate sheets made filing impossible. This, in turn, spokesmen for the union deny, and add that they are weary of the interminable delay and will demand that the equalization be written into the new agreement and not, as in the past, be left as a subject for future study and report.

The section of demand No. 3 covering payment for deadwork performed by contract miners and extra pay for overtime and Sundays and holidays renew demands rejected in previous negotiations. The principle that "rates paid for an employee's principal occupation should obtain when, for any reason, he is occupied temporarily in another kind of employment" was held to be unsound by the Anthracite Coal Commission in 1920. The award that year dismissed the miners' arguments with the declaration that "no adequate reason has been presented why the rate prevailing for any type of work should not govern in the case of all persons engaged in that work."

A similar fate overtook the demand for punitive overtime. The Commission held that there are certain necessary services in connection with the operation of the anthracite industry which could not be covered by the basic eight-hour day and that this fact had been recognized in the agreements entered into whereby employees who work a longer day are paid the usual rates for overtime. The rejection of this demand at that time provoked a bitter protest from Commissioner Ferry, the Mine Workers' representative, who maintained that it was only the inadequacy of the regular rates which made men willing to work longer hours. The 12-hour day, criticized by the 1920 Commission and condemned by the U. S. Coal Commission in 1923, has since been abolished. Only a very small percentage of the total employees came under its provisions.

**J. B. Warriner**
Member of the Operators' Subcommittee in Anthracite Wage Conference.

The demand for double time on Sundays and holidays was rejected in 1920 on the same general line of reasoning—the necessity of continuous operation. For over 20 years, however, provision has been made for the relief of workers in seven-day occupations and that arrangement was taken into consideration by the 1920 Commission.

The miners also brought up that part of their demand No. 3 which calls for the establishment of a five-day week. This demand is a heritage of the nationalization movement which threatened to engulf the United Mine Workers' organization during the brief régime of Frank J. Hayes. A five-day, 30-hour week was one of the demands made in 1920, but it was quietly dropped before the miners' case was presented before the Anthracite Coal Commission.

Union spokesmen at Atlantic City asserted the five-day week would lessen the strain on the workers and reduce accidents. At the same time they disclaim any intention of opposing overtime hours at punitive rates "in emergencies." The operators, of course, object to an agreement that would prevent steady production, except at a premium, during periods of brisk demand. In view of the readiness with which conservative leaders of the union have shelved demands of this type in the past, it is not reasonable to anticipate any last-ditch fight by them for this particular section of their program.

On Thursday the subcommittee, temporarily at least, began and concluded its deliberations on demand No. 4 and started to canvass the situation on demand No. 5. Demand No. 4 asks, first, the substitution of the per ton for the per car basis of payment; second, the fixing by mine committees and colliery officials of the permissible percentage of refuse per car, and, third, the abolition of "the present unreasonable penalties and dockages."

At the present time, between twenty and twenty-five collieries out of the 300 operations in the region pay

**Thomas Thomas**

Member of the Operators' Subcommittee in Wage Negotiations at Atlantic City.

upon a tonnage basis. The payment in these cases is upon the so-called miner's ton, which ranges from 3,100 to 3,900 lb. The miners assert that this ton was established in the days before there was a market for the small sizes and that, therefore, it covered not only the refuse but the unmerchantable small coal which went to the culm banks. Now, they argue, the juniors from pea down are sold by the operators and it is only fair that the workers be compensated. Based upon this theory, they feel that their demand that the miner receive the same pay for 2,240 lb. as he now gets for the miner's ton is quite reasonable.

The operators, however, contradict this version of the origin of the miner's ton. When those bases were being established, they say, the underground worker raked the coal he had brought down with a rake with tines placed 2 in. apart. Coal passing between the tines was not loaded. The payment made, therefore, was for the large coal; the fines went to the gob piles. Any fines going to culm banks were the product of degradation in the breakers. In other words, the system of operation and payment was suggestive of the old lump-coal basis formerly prevailing in the bituminous fields.

Now the miner or his laborer loads all the coal brought down and is paid for it, so that the operators consider the miners' explanation at variance with the facts and their argument without merit. To grant the same rate for loading a gross ton as is now paid for loading a miner's ton, plus the 10 per cent increase asked for contract workers, would mean increasing the labor cost in cars at the face 54 per cent where the miner's ton is 3,136 lb. and still more where that ton is greater.

This demand has been pressed in one form or another since 1902 and has never been granted either by the operators or by government commissions. To the man in the street a ton different from the familiar gross and net tons of his experience is hard to understand. It seems an arbitrary basis to adopt—and it is an arbitrary basis. But, as the Roosevelt Anthracite Strike Commission pointed out, the adoption of any unit of measuring compensation, whether it be a ton, a car or a yard, is necessarily arbitrary. It is a natural assumption, however, that when rates were first fixed upon the basis of a miner's ton, they were fixed at a higher point in dollars and cents than would have been the case had the basis then adopted to measure compensation been a gross ton.

In the arguments in support of their position the miners also brought in the question of topping. They contended that much of the 6-in. square topping which the operators demand is lost during the course of underground haulage. The statement was made by one of the district presidents that the equivalent of between 300 and 900 cars were so lost every half-month in some collieries and that company loaders later went through and loaded such coal found in the haulageways. It was claimed that if payment was upon a weight instead of a car basis, topping would not be demanded. The only exception that the miners would make to the demand for the extension of the tonnage system of payment was in the case of work in steep pitching veins, where, it was conceded, the yardage basis was the only satisfactory method.

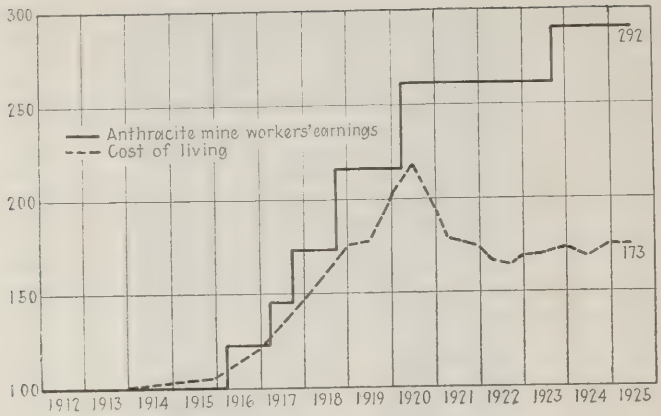
The operators did not deny directly that the tonnage reloaded from haulageways might run as large as charged by the miners. Their answer was that much of this loss could be avoided if the miners would load and top their cars properly and pointed to the fact that in collieries where payment was on the ton basis cars were topped much more heavily and in such a manner that there was little or no spillage. In cases where the loss is due to the wreck of a trip or to a single car jumping the track, the miner, they said, does not suffer because he is given credit for a full load on such cars by the check weighmen. Instead of regarding the coal reloaded by company men in the roadways as so much "velvet," the cost, plus the price already paid to the contract miner, often exceeds the value of the coal.

The operators also took sharp issue with the demand of the miners for the abolition of existing systems of penalties and dockage and the institution of agreed permissible maxima of refuse at each colliery. The miners alleged that, under the present system, they are the victims of arbitrary dockage and penalties. The operators answered that ample protection against injustice is afforded the workers through the mine grievance committees and the Board of Conciliation. The producers construe the agreement with the men to call for the loading of clean coal. At the same time they recognize that some seams run higher in impurities than others and say they take this into account in deciding what constitutes "clean" coal. But to fix permissible maxima of refuse would, in their opinion, simply invite the loading of dirty coal.

Demand No. 5 calls for:

> ......payment for all sheet iron, props, timber, forepoling, extra and abnormal shoveling where such is not now paid for; and that the same full rates shall be paid for skipping as for splitting pillars, both advancing and retreating; advanced openings driven for development purposes shall be paid for on the proper basis covering such work; that in thin veins, where the pitch is not sufficient to carry the coal on the bottom, the distance of the working places shall not exceed 150 ft.

The first clause quoted is practically a repetition of a demand denied by the 1920 Commission. The basis for this demand is found in the fact that in some cases compensation for setting up props, etc., is included in the car or yardage rate and in others these items are paid for separately. The wording of the demand suggests that this extra labor is not always paid for, but that such is the case the employers specifically deny. As they understand the miners' position, the workers would not be satisfied with splitting up the car or yardage rates which cover these extra demands into separate items, but are seeking to have extra compensation added on to such car or yardage rates.



**Do Anthracite Miners Need More Pay?**

This chart traces the steady rise of wages and the variations of the cost of living, taking 1912 as a base. Miners' representatives have persistently held that a wage reduction would lower the standard of living.

In other words, every one of these so-called minor demands of technical character would, if granted, add to the cost of production. It is estimated that the "minor" demands so far considered would add $1 per ton to the cost of coal.

Conclusion of the consideration of demand No. 5 and a discussion of demand No. 6 absorbed the time of the subcommittee on Friday. The debates centered around free jack hammers and air, free electric lamps and batteries for shot-firing and the establishment of uniform minimum rates of 20c. per inch for refuse in all kinds of mining up to 10 ft. wide, and 30c. per inch for blasting top and bottom rock. A demand for a minimum of 17c. per inch on refuse was denied by the Anthracite Coal Commission in 1920 and that body also refused to entertain the plea that the operators should supply free tools to company men.

The spokesmen for the miners claimed that present rates for refuse range from 11c. up and that blasting rates range from 12 to 30c. They attacked the absence of a fixed minimum as unfair to the men and argued for the abolition of the allowance system. To grant these demands, declared Major Inglis, "would add, at a conservative estimate, $30,000,000 a year to production costs, this sum to be distributed among about one-third of our employees, or about $650 a year apiece. This would be added to present rates which already fully compensate these workers."

In discussing the demand for jack hammers, the miners asserted that these machines were coming into more general use and enabled the companies to work places that could not be worked successfully under old methods of mining. The initial cost of the jack hammer was placed at $200 and the upkeep at approximately $10 per month. The cost of the compressed air to operate the machines was estimated at 5 per cent of the gross earnings of the miners using the hammers. The employers answered that less than 5 per cent of their workers used the jack hammers and that the adjustment of wage rates took into account the long established practice under which the miners supplied his own tools. Electric shot-firing in certain places, they pointed out, had been required by law as a safety measure and they could not be held responsible for the cost.

The first rumblings of the storm which threatened to break up the negotiations came on Friday with a brief statement from President Lewis of the United Mine Workers, who had returned to Atlantic City the previous night after having absented himself from all meetings of the subcommittee except the first one held July 10. Mr. Lewis signalized his return with the announcement that "it is regrettable that no progress of any character has been made by the conference. The operators occupy their time with denying everything and yielding nothing. They continue to mouth their ancient phrases about wage reductions and arbitration."

"When the miners' representatives come into conference with demands that would add about $100,000,000 a year to the cost of production, while every competitive and economic condition demands a decrease in cost," retorted Major Inglis for the operators, "it naturally requires some time to bring the discussion within the realms of reason. Any delay that has taken place is solely due to the deliberation with which the miners' representatives presented their case in the earlier sessions and the irrelevant matters introduced by them. The delay is certainly not due to us since the miners, as plaintiffs in the case, have had the floor since negotiations began.

"As to the substance of Mr. Lewis' statement, he apparently thinks that the only way of arriving at a settlement is to concede demands, however unreasonable they may be. As to the tone of his statement, it may be considered as part of a plan to aggravate, rather than harmonize, the situation."

Mr. Lewis' next move was to write a letter to S. D. Warriner demanding that Mr. Warriner and W. J. Richards sit in with members of the subcommittee on Aug. 4. The letter took up the strain that the miners' camp has been singing for a month—that the committee of operators at Atlantic City were "second string" men without power to act. Mr. Lewis wrote that if Messrs. Warriner and Richards indorsed the position of the subcommittee "it would the more quickly enable the Mine Workers' representatives to effectuate a discontinuance of the farce."

On Monday of this week Mr. Warriner, as chairman of the Anthracite Operators' Conference wrote Mr. Lewis refusing to change the personnel of the operators' committee at Atlantic City. He said that the present personnel is clothed with full power and is in no way delaying possible progress toward a peaceful settlement. The members are of the same status in the industry as Mr. Warriner and Mr. Richards were when they began their long terms as negotiators of contracts years ago.

Mr. Warriner refuted Lewis' claim that operators are trying to bring about a strike. He called Lewis' attention to the operators' proposal at the beginning of negotiations, July 9, that both sides agree there shall be no stoppage of production Sept. 1. Mr. Warriner renewed the operators' proposal that disputed points be referred to an arbitration board of "impartial persons."

He warned President Lewis that he is taking upon himself a "grave responsibility" if he insists upon breaking up the conference simply because Warriner and Richards do not join the sub-committee. The operators are not trying to dictate the personnel of the miners' committee, said Mr. Warriner, and they see no reason why the miners should dictate the operators' committee.

# News Of the Industry

## British Coal Strike Staved Off by Government Plan to Aid Operators Nine Months; Union Feels Victorious

The British coal miners' threatened strike, together with a proposed sympathetic general strike which might have paralyzed the nation, has been postponed and possibly prevented. The government averted the crisis at the last minute by agreeing on July 31 to guarantee financial assistance to the mine owners for nine months. In return for this the operators withdrew their wage-cutting notices from the pitheads and union labor sent up a great shout of victory. The notices were to have been effective Aug. 1. A government commission is to be appointed at once to conduct a two-weeks investigation of the whole situation. There is a feeling of confidence in England that this commission will arrange an agreement between miners and operators to provide for a winter's work at present wages under the government subvention. Thus the black cloud over England appears to have been lifted.

The course of Prime Minister Baldwin in offering to subsidize the mine owners in order that British mines might operate and British coal might meet foreign competition is criticized bitterly in some quarters. Mr. Baldwin is said to have surrendered to the bludgeoning of union labor directed by bolshevist minds. It is pointed out, however, that the approximate £10,000,000 which the subvention may cost before next May 1 will be far less than the probable cost of doles to workless men who would be thrown out of jobs by the threatened strikes and that any course of the government that keeps the mines working would be less expensive than the industrial collapse which appeared imminent.

Under the last-minute plan, whenever wages to miners, calculated in accordance with the recognized division between wages and profits, would be lower than the present minimum scale, the deficiency is to be made up to the mine owners from the government exchequer. The exact cost of this deficiency, of course, is not calculable now, but the estimate of £10,000,000 is generally accepted. This, naturally, comes out of the pockets of the country's taxpayers. Newspapers are commenting on the effect that will be created if other struggling industries also demand government aid—from the taxpayer—as well.

The House of Commons on July 31 passed the unemployment bill which amends the doles act originally passed under the administration of the MacDonald labor government. The amendment safeguards the doles fund in an effort to reduce the amount paid to the unworthy. The labor party strongly opposed the amendment, saying 70,000 men entitled to doles would be deprived of that aid now. The government expects to save £400,000 a year. A large share of the funds that have been paid out in doles has been going to jobless coal miners.

### Coal Board to Compose Ruhr Coal Troubles

A commission will be created to pass on the difficulties between operators and the employees in the Ruhr coal field and a conference of the mine owners and miners will be summoned this week to determine measures for mitigating unemployment distress. This was decided after a long conference at the Ministry of Labor, July 28, between the representatives of the German Government and the spokesmen for the coal miners. The official communiqué failed to mention whether the miners can be persuaded to work an extra half hour daily, one of the most important points at issue.

From an authoritative quarter it is learned that the Reichsbank has offered to advance credits aggregating 15,000,000 marks a month to the head of the coal industry, though the mine owners ask 500,000,000 marks as the absolute minimum required to keep the industry afloat. Their normal monthly turnover, they point out, is 120,000,444 marks, of which nowadays they are not realizing more than about 60 per cent.

Coal and coke stocks in the Ruhr have accumulated to the unprecedented figure of about 9,000,000 metric tons. With coal selling at an average of about 15 marks a ton the value of stocks on hand is approximately 135,000,000 marks. These stocks the operators want the government to take over. Chancellor Luther, however, considers that they have painted the situation too darkly. He is understood to regard 200,000,000 marks as sufficient to tide over the present crisis.

As regards unemployment, it is stated that while only about 40,000 miners are out of work now, the numbers are bound to increase within three months to 100,000, which means 500,000 persons dependent on charity for existence.

First Lord of the Admiralty, who was named to act as mediator in the deadlock of British coal operators and miners that threatened to result in a strike before Premier Baldwin stepped in and saved the situation by extending to the operators a government subsidy for nine months.

### E. S. McCullough Tries to Form Pittsburgh Union

In its effort to get the miners of western Pennsylvania to organize a district independent union, the Pittsburgh Chamber of Commerce has employed E. S. McCullough as the "industrial aide" of the chamber's Citizens' Committee. McCullough, who spent most of his life in the service of the United Mine Workers, is 55 years old and for 40 years was either a miner or a labor official. In 1897 he was president of Sub-District 2 of the United Mine Workers in Ohio. Since then he has been president of the Michigan district and was international vice-president in 1909. He led the Meyersdale strike which ran from 1903 to 1905, and directed the 1910 strike in Nova Scotia.

He has established headquarters in Pittsburgh and is trying to line up the jobless miners of that territory to form a union which will make an agreement with the operators in order that the mines may operate. Only by this means can prosperity be returned to western Pennsylvania, in the opinion of the Chamber of Commerce.

## Hammond Counsels Against Interference in Coal

### By Paul Wooton

Washington Correspondent of *Coal Age*

"Since settlements reached by political pressure rarely possess elements of permanency and frequently are not economically sound, it is very much better to have these differences settled within the industry."

"The talk of a coal shortage bears the brand of manufactured stuff. There is a great deal of coal in storage. Even in New England little inconvenience would be experienced before midwinter."

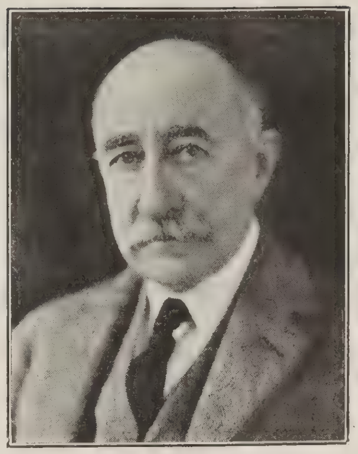
"I cannot conceive on what grounds a bituminous walkout could be justified since the union has signed a three-year agreement at the war-time wage scale."

These are quotations from John Hays Hammond, the renowned mining engineer who was chairman of the Harding Coal Commission. They are embodied in an interview with this correspondent, who was sent for the purpose by *Coal Age* to Gloucester, Mass., where Mr. Hammond has his summer home. This interview was given to the daily press at the time.

Mr. Hammond revealed that President Coolidge's position probably is "that it would be premature to assume that this dispute is not going to be settled within the industry." In that connection Mr. Hammond counseled: "The public should grant with patience every opportunity to the parties at interest to settle the controversy themselves." He also calls attention to the fact that "the attitude of the public influences profoundly such negotiations as those now in progress and it largely controls the state of the coal market. If the people become panic-stricken and bid up the price of coal they simply play into the hands of that small and selfish element that desires a strike.

"A suspension of anthracite production would have to last many weeks before it would be felt seriously," said Mr. Hammond. "The strike of 1922 lasted five months, and even then the supply was 60 per cent of normal. Even in New England little inconvenience would be experienced before midwinter.

"All elements leading up to the suspension in 1923 were analyzed carefully by the Fact-Finding Coal Commission which was sitting at that time. As a member of the commission I have first-hand knowledge of what transpired during that comparable period. We discussed the various phases of the matter at great length, both with the operators and the leaders of the mine workers. The issues between the two parties were the same then as now. After careful and extended study the commission made its recommendations to President Coolidge as to how the controversy should be dealt with. Those recommendations apply equally well to the present situation, and the President is thoroughly familiar with them."



**John Hays Hammond**

Mining engineer who formerly served as chairman of the Harding Coal Commission believes operators' and miners' differences should be settled within the industry.

## Hard-Coal Operators Advise On Combustion Problems

In addition to two traveling exhibits the purpose of which is to show consumers how to use all sizes of anthracite in the most economical way, the anthracite coal operators have inaugurated an engineering advisory corps known as Anthracite Coal Service. This corps is made up of combustion engineers whose experience and advice have been placed at the service of large purchasers of fuel for heat and power. Some of the problems they have already solved are the proper fuel for new buildings, better ways of using all sizes of anthracite in a dozen different industries and improved methods of stoking in several hundred different heat and power plants.

These combustion engineers are stationed in the following cities: New York (122 Greenwich St.); Philadelphia (Atlantic Building, 260 S. Broad St.); Boston (Chamber of Commerce Building); Washington (1415 I St. N. W.); Providence (Caesar Misch Building); Albany (250 Arkay Building) and Syracuse (208 Gridley Building). Their service is free to all who care to avail themselves of it.

James J. Storrow, of Boston, Mass., who was Federal Fuel Administrator for the New England States during the World War, was unanimously elected president of the Boy Scouts of America at the fifteenth annual meeting of the national council, held in New York recently. Mr. Storrow pledged his personal credit during the war, when immediate action was necessary to relieve the acute coal shortage in New England, and subsequently shipped and distributed at his personal risk more than a million tons of coal, a gross business exceeding $10,000,000. He is a member of the banking firm of Lee, Higginson & Co., chairman of the board of the Nash Motors Co. and director in many corporations.

## Byproduct Coke Output Off 9.6 per Cent in 1924

The quantity of coke produced at byproduct ovens in 1924, according to the Geological Survey, was 33,983,568 net tons, a decrease of 9.6 per cent as compared with the output of the preceding year. In addition to the large coke there were produced 2,950,810 tons of breeze. The quantity of coal charged into the ovens was 49,061,339 tons. The average yield per ton of coal charged was therefore 69.3 per cent of merchantable coke and 6 per cent of breeze.

AVERAGE YIELD OF COKE AND BYPRODUCTS PER NET TON OF COAL CHARGED IN BYPRODUCT OVENS IN THE UNITED STATES, 1915 AND 1924

| Product | 1915 | 1924 |
|---|---|---|
| Coke, pounds | 1,440 | 1,386 |
| Tar, gallons | 7.1 | 8.6 |
| Ammonium sulphate (or equialent) pounds | 20.1 | 22.2 |
| Light oil, gallons | 1.5 | *a* 2.9 |
| Gas: | | |
| Total, M cu.ft. | 11.0 | 11.0 |
| Surplus sold or used, M. cu.ft. | 4.3 | 6.1 |
| Burned in coking process, M. cu.ft. | 6.3 | 4.7 |
| Wasted, M. cu.ft. | .4 | .2 |

(*a*) Average for plants now recovering light oil.

Three-fourths of the total, or 24,524,000 tons, was used by the producer in affiliated blast furnaces or other operations. The sales amounted to 9,848,834 tons. Of the furnace coke sold, the greater part went to affiliated corporations. There were, however, merchant sales amounting to 1.591,000 tons. Sales of foundry coke were reported to be 1,554,000 tons, valued, at $13,425,000; and sales of domestic coke, 2,813,000 tons, valued $20,063,000. For industrial and other uses than foundry, furnace, or domestic fuel the sales reported were 1,556,000 tons, with a value of $11,855,000. These figures are subject to slight revision on receipt of further information by the Survey.

Coking operations in 1924 show increased yields in tar, light oil and ammonia.

BYPRODUCT COKE PRODUCED AND USED BY THE PRODUCER IN THE UNITED STATES IN 1924

| State | Produced | | Used by Producer in Blast Furnaces, etc. | |
|---|---|---|---|---|
| | Net Tons | Value | Net Tons | Value |
| Alabama | 4,386,372 | $16,563,223 | 3,888,760 | $14,137,294 |
| Colorado | 523,405 | (*a*) | 505,846 | (*a*) |
| Illinois | 2,355,474 | 20,187,519 | 1,327,820 | 10,799,086 |
| Indiana | 4,272,435 | 30,394,497 | 3,831,406 | 26,878,239 |
| Maryland | 810,118 | (*a*) | 693,588 | (*a*) |
| Massachusetts | 397,640 | (*a*) | 5,446 | (*a*) |
| Michigan | 1,770,547 | 11,914,028 | 535,296 | 3,817,866 |
| Minnesota | 514,764 | 4,903,891 | 199,253 | 1,695,269 |
| New Jersey | 869,120 | (*a*) | 51,850 | (*a*) |
| New York | 1,600,669 | 11,108,944 | 556,283 | 3,888,027 |
| Ohio | 5,723,074 | 31,008,209 | 4,538,383 | 24,724,264 |
| Pennsylvania | 8,426,155 | 34,674,512 | 7,145,581 | 28,046,102 |

| Washington | 39,903 | 283,710 | 34,815 | 243,705 |
| West Virginia | 998,914 | 4,402,186 | 590,428 | 2,607,708 |
| Kentucky, Missouri, Rhode Island and Wisconsin | 1,121,908 | 9,387,943 | 25,474 | 205,634 |
| Undistributed | ........ | 20,485,019 | ........ | 8,795,193 |
| | 33,983,568 | $195,690,009 | 24,523,933 | $125,838,387 |

(*a*) Included under "Undistributed."

# Tear Gas Used in West Virginia Labor Struggle; Panhandle Quiet

That tear gas discharged from a "billy charge" by mine guards employed by the Jamison Coal & Coke Co., near Farmington, Marion County, in the northern West Virginia strike zone, was alleged last week by officials of the United Mine Workers in telegrams to Secretary of Labor James J. Davis at Washington, D. C., and to Governor Howard M. Gore at Charleston. As a result more excitement prevailed than at any time since April 1, when non-union coal miners were called on strike.

Although the alleged offense occurred on the picket line at mine No. 9 early Monday morning, July 27, the information concerning the incident did not develop until later in the week. In the telegram to Secretary Davis the union miners alleged that 35 people were gassed and that one woman, Mrs. July Srinto, an occupant of the union barracks, was seriously affected. In the telegram to Governor Gore, the miners pointed out that both the state police and sheriff's deputies were absent for a period of time.

W. Clarke Dobbie, general superintendent of the Jamison company in West Virginia, made a complete denial of the story Monday, July 27, but when the guards returned that night he learned that the "billy charge" was accidentally put off, and says that the guards got the full force of the gas. The story told by the guards is that a clip on the mace was accidentally snapped while one of them was riding in an automobile from the picket line back to the mine. The guards deemed the matter too trivial to report.

Fairmont newspapers assert that the mine guards' account of the incident was not in line with the facts, and that a number of pickets were actually gassed by the mine guards. This view is held by deputy sheriffs and state police, who made an investigation.

### Hard Coal Miners Praise Bittner

A story published in newspapers to the effect that the hard-coal miners had deserted the bituminous union coal miners in northern West Virginia, and that they had condemned Van A. Bittner, the union leader in the Fairmont field, was denied in a telegram received in Fairmont July 28. The telegram, which bore the names of the anthracite policy committee, Philip Murray, international vice-president; Thomas Kennedy, international secretary and treasurer; Christ J. Golden, president of District No. 9; Rinaldo Cappelini, president of District No. 1, and Andrew Matty, president of District No. 7, said the policy committee had the utmost confidence in the ability, integrity and honesty of the leader, Van A. Bittner." After congratulating the northern West Virginia miners for the "wonderful fight" they are making, the telegram closed by pointing out that "with both the anthracite and bituminous coal fields fighting together we are bound to win."

Twelve union pickets arrested at the New England mine of the Consolidation Coal Co. recently, were heard by a Fairmont justice of the peace July 28 and bound over under $400 bail to await the action of the grand jury.

Workmen were engaged in cleaning up Mine No. 1 of the Cleveland & Morgantown Coal Co. in Scotts Run last week and, according to officials, the plant will resume operation on a union basis in about a week. In a statement issued by James McCleary, international representative, during the later part of last week it was predicted that three or four additional mines in Scotts Run would be reopened on a union basis.

### Union Output Is Low

Non-union coal mines in northern West Virginia produced 5,824 cars of coal in the first four days of last week, according to figures by the operators. The union tonnage was placed at 864 cars.

Van A. Bittner, chief international representative in northern West Virginia, returned to Fairmont early this week, after having been in Philadelphia and Atlantic City, where he conferred with International President John L. Lewis in reference to the strike situation in northern West Virginia. Mr. Bittner has been absent for several weeks and a rumor was current that he would not return.

Everything continues quiet in the panhandle district and there are apparently no new developments.

## *Enterprise Coal Co. Sold For $1,250,000*

The Enterprise Coal Co., at Shamokin, with headquarters in Scranton, Pa., was reported sold Aug. 3 for $1,250,000 to a group of Scranton and Wilkes-Barre coal operators headed by R. H. Buchanan, general manager of the South Penn Collieries Co. The sale includes the Enterprise mine and breaker and a long lease on 700 acres of coal land owned by the Philadelphia & Reading Coal & Iron Co.

There is said to be 14,000,000 tons of recoverable coal in the tract. The colliery is now being operated at capacity, which is 300,000 tons a year. The plant is electrically equipped throughout. The Enterprise company was the property of the late W. L. Connell, but since his death its operation has been conducted by the Connell estate. James S. McAnulty, president of the Scranton Life Insurance Co., has been president and treasurer of the Enterprise company and W. L. Connell, Jr., has been secretary.

The new owners of the Enterprise mine have been organized under the name of the Northumberland Mining Co. R. H. Buchanan is president of the new company; Bruce Payne, of Wilkes-Barre, is treasurer; Grant Bell, vice-president; H. R. Van Deusen, secretary; M. J. Martin, Scranton attorney, is a member of the board of directors. The office of the company will be maintained in Scranton.

## How to Design and Specify Heating Systems Told

A brochure of twenty pages, just published, and entitled "Architecture and Anthracite," contains many illustrations and much valuable information as to the designing and specifying of heating installations that are satisfactory artistically and sound economically. It is published by the Anthracite Coal Service, 260 South Broad St., Philadelphia, Pa.

The chimney, one of the most important features of a home and its heating equipment, is one theme of this publication. The booklet gives valuable data including a table for figuring the size and height of chimneys for various installations, as prepared by the American Society of Heating and Ventilating Engineers. It also compares the "effective area" of each rectangular flue with its actual area.

With illustrations showing well-proportioned chimneys as well as "horrible examples," Albert Kelsey has prepared an article on the chimney as an "object of interest and beauty."

Diagrams of the standard sizes of flue linings also are shown to enable architects and engineers to specify the correct size and allow for the exact dimensions. A specification for chimneys is added such as will enable designers to insure a chimney soundly built and in accordance with the ordinance of the National Board of Fire Underwriters and the proposed code of the American Society of Heating and Ventilating Engineers.

Other features which should be given full consideration in designing, specifying and constructing are covered in the booklet by D. Knickerbacker Boyd, who discusses many of them in an article entitled "Designing and Planning for Home Heating Economies." Mr. Boyd calls attention to the responsibility of architects, and such builders as construct and sell dwellings without architects, for specifying and seeing that six things are provided for the home owner, namely:

(1) Adequate size and height of flues for all heating and cooking apparatus.

(2) Proper location and construction of all chimneys.

(3) Correct specifying and installing of heating and cooking apparatus to utilize small as well as large sizes of coal.

(4) Economic location and sound construction of coal bins.

(5) Providing convenient facilities for the removal of ashes.

(6) Making walls, roofs and openings tight.

In an article, "Small Size Anthracite Fuel and Equipment for Its Economical Utilization," C. A. Connell outlines possibilities of making great savings in fuel bills by the use of approved apparatus and methods for burning buckwheat coal.

## American Foreign Traders Convene at Seattle

Statistics, said James A. Farrell, president of the U. S. Steel Corporation, at the Twelfth National Foreign Trade Council meeting at Seattle, Wash., June 24-26, illustrates the immensity of foreign trade, the value of which in the aggregate in 1924 was sufficient to build a Panama Canal every fifteen days. The trend of such business is favorable in diversity as well as in value. Our productive capacity is so great that overseas trade is the logical outcome; but competition must be faced abroad, and to meet this successfully necessitates the fullest utilization of mechanical devices and the highest degree of economy in distribution.

In the absence of Dr. H. Parker Willis, professor of banking at Columbia University, his paper on "Foreign Loans and Foreign Trade" was read by the secretary, O. K. Davis. After quoting statistics to indicate the immensity of loans made by the United States to foreign countries in recent years, Dr. Willis mentioned that the problem of the banker was to determine the credit rating of those who wanted to buy goods with the money sought, and the good faith of those who wanted funds. Bankers, however, should realize that the surplus at their command represents a surplus of goods, and that they have a national duty toward trade and commerce.

Bank practice in regard to foreign loans has been considered in many quarters as very much of a mystery, but when viewed as a fundamental problem in the aggregate the matter is a simple one. If a banker is approached for a loan at home, he first inquires as to what use it is to be put. He needs good security, but he also wants to see that the transaction will mean increased business to him and to his community. It is not enough for him to know that the agreed interest will be paid at the agreed time.

The same considerations should apply to foreign loans, but it is significant that one school of bankers believes that it is none of their business as to how the money is to be spent, although it is obvious that the adoption of a similar policy would be disastrous in community banking practice. This same school of bankers asserts that results will be satisfactory "in the long run," but Dr. Willis pointed out that we don't live "in the long run." Immediate business is the chief concern.

The United States has the chief reservoir of available capital in the world, which, however, is not sufficient for all demands that may be made upon it. The lending of money solely for the purpose of bringing profit to the banker is economically unsound, for it may be used to finance or subsidize an enterprise launched in direct competition with United States products.

"Shippers' Problems in Foreign-Trade Transactions" was the subject of an exhaustive analysis of the technique of the subject by F. G. T. Lucas, of Vancouver, B. C. A letter of credit must be lived up to, it was maintained, and a uniform method of framing the document was desirable. This had been achieved in what was known as the American Standard Letter of Credit. With the bill of lading, however, variations in form occurred from day to day, the result being, as the speaker humorously remarked, that the carrier might be excused for almost any happening except the conversion of the goods to his own use. The document had become cumbersome and complicated, and legislation had been necessary in some countries to correct the inequities resulting.

Vice-president of the Consolidation Coal Co., who sailed from New York last week on a trip abroad on business and pleasure. He was accompanied by his wife and son.

The "Benefit of Insurance Clause" has led to many lawsuits. A real attempt to remedy this state of affairs was made in the introduction of what is known as the "Hague Rules Bill of Lading," which is now adopted as law in Great Britain. In this, many objections in the ordinary bill of lading have been removed, including the "Benefit of Insurance Clause." The right to deviate from the original course has been confined to reasonable limitations, and the minimum of responsibility on the part of the carrier has been defined. It makes the bill of lading a negotiable document and simplifies foreign trade.

Among the speakers were Gerard Swope, Howard T. Lewis, F. J. Koster, J. S. Martin, J. Butler Wright, D. E. Delgado, A. P. Dye, H. M. Robinson, E. P. Thomas, Tso Tsok-Kai, N. Eckstein, Dr. T. H. Boggs, H. Blackwood, Rear Admiral L. C. Palmer, C. W. Cook and Rev. E. A. Walsh.

## New York Anthracite Prices for August, 1925

(Per Gross Ton f.o.b. Mines)

| | Broken | Egg | Stove | Chestnut | Pea |
|---|---|---|---|---|---|
| Lehigh & Wilkes-Barre Coal Co.. | $8.20 | $8.65 | $9.15 | $8.65 | $5.00 |
| Lehigh Valley Coal Sales Co...... | 8.25 | 8.70 | 9.15 | 8.90 | 5.00 |
| Lehigh Coal & Navigation Co.. | 8.90 | 8.90 | 9.30 | 8.85 | 5.50 |
| D.L. & W. Coal Co. | 8.25 | 8.65 | 9.15 | 8.65 | 5.25 |
| Hudson Coal Co.. | 8.80 | 8.70 | 9.15 | 8.65 | 5.40 |
| Phila. & Reading Coal & Iron Co.. | 8.90 | 8.85 | 9.25 | 8.85 | 5.50 |
| M. A. Hanna Co... | 8.80 | 8.90 | 9.40 | 8.90 | 5.55 |

Steam sizes: Buckwheat No. 1, $2.50; rice, $2; barley, $1.50; birdseye, $1.60.

## Industrial Advertisers Name Convention Chairmen

Appointment of chairmen for important committees featured progress made in the last week in the development of plans for the convention of the National Industrial Advertisers Association to be held at the Chalfonte Hotel, Atlantic City, N. J., Oct. 19, 20 and 21. One new appointment was that of J. N. McDonald, of the Anaconda Copper Mining Co., New York, incoming president of the Technical Publicity Association, to be chairman of the On-To-Atlantic City Committee.

Other chairmen named are: D. J. Benoliel, of the International Chemical Co., Philadelphia, to head the Exhibit Committee; Hoyt Catlin, of the Bryant Electric Co., Bridgeport, to head the Entertainment Committee, and H. J. Downes, of the American Locomotive Co., New York, to head the Transportation Committee.

Organization of the General Committee has been completed. W. A. Wolff of the Western Electric Co., New York, is chairman. The other members are: J. L. Ashcroft, Ludlow-Saylor Wire Co., St. Louis; Joseph C. Bowman, Cleveland; Ezra Clark, Clark Tructractor Co., Buchanan, Mich.; O. C. Dahlman, Koehring Co., Milwaukee; W. S. Hays, National Slate Assn., Philadelphia; Mr. McDonald and A. M. Staehle, Westinghouse Electric & Manufacturing Co., East Pittsburgh.

## Railroad Fuel Cost Drops

The cost of coal used by class 1 railroads in locomotives in transportation service during May took a sharp drop, according to a tabulation prepared by the Bureau of Coal Economics of the National Coal Association, from figures reported by the roads to the Interstate Commerce Commission. The average cost of such coal, which represents the invoice price paid at the mine plus any freight charges incurred, was $2.73 per net ton for the United States as a whole. For the Eastern district it was $2.79; for the Southern district $2.22, and for the Western district $3.04. These averages indicate a decrease in cost per ton from the previous month of 6c. in the Eastern district, 9c. in the Southern district, 5c. in the Western district and 6c. for the entire United States.

Compared with May a year ago, when locomotive fuel costs were already at a low level, the reduction in the cost of locomotive coal to the railroads is even more striking. The averages for May of this year are 35c. per ton less for the Eastern district, 47c. less for the Southern district, 21c. less for the Western district and 34c. less for the whole United States.

---

The Washington Coal & Coke Co., of Star Junction, Pa., is erecting a tipple equipped with shaker screens, loading booms and miscellaneous equipment. The capacity of the tipple is 600 tons an hour. It is reported that this is one of the largest plants in that coal field.

## *World's Hoisting Record Is Now 10,024 Tons*

And now the much-shattered world's coal-hoisting record has been completely demolished. New Orient mine of the Chicago, Wilmington & Franklin Coal Co. was reported to have hoisted 10,024 tons of coal during an 8-hr. shift on July 30, far exceeding its achievement of 8,687 tons on July 10. The previous record for a single day's hoist was 8,664 tons from the Valier mine of the Burlington railroad at Valier, Ill. Before that the record had been juggled back and forth between Orient No. 1 and Zeigler No. 1, both in Franklin County (Illinois) region of hopper mines. The New Orient mine, built to be the world's greatest producer, which now leaps so far to the front, is expected some day to hoist at least 12,000 tons a day.

## $2,500,000 Bond Issue by Alabama Operation

The Southeastern Fuel Co., with headquarters at Birmingham, Ala., the entire capital stock of which is owned by the Southeastern Power & Light Co., has sold Harris, Forbes & Co., New York, $2,500,000 first (closed) mortgage 6 per cent sinking fund gold bonds. It is announced by A. B. Aldridge, president of the Southeastern Fuel Co., that this issue is to reimburse the power company for advances made to the fuel company and to provide funds for extensive developments and improvements now under way.

The holdings of the Southeastern Fuel Co. comprise about 12,000 acres of valuable coal lands in the Warrior Field, in Walker County, Alabama, adjacent to the Gorgas steam plant of the Alabama Power Co. The latter company has entered into a 21-year contract to purchase sufficient coal and at such prices as will provide each year ample funds to pay the operating expenses of the fuel company, including interest and minimum sinking fund payments on these bonds, such fund to be provided by a levy of 10c. per ton on production up to 400,000 tons per annum and 15c. per ton on amounts in excess of this output. The present output of the four drifts now in operation is stated to be about 650,000 tons, which it is expected to be increased later to 1,000,000 tons when coal is produced from four additional drifts which are now being opened.

## Archbald Breaker Burned

The Whip-o-Will breaker of the Archbald Coal Co., Archbald, Pa., about eight miles north of Scranton, was destroyed by fire July 29. The breaker had been idle for some time, but the mine was operating and the coal was shipped to another breaker for transportation. Several hundred mine workers underground escaped without injury. The damage was approximately $100,000.

## Heavier Coal Output at Russian Mines Hampered By Scarcity of Markets

Like the rest of Europe, Russia faces a serious coal crisis. Output in 1924 was much higher than in 1923, and the possibility of a further rapid increase exists, but just now the home market will not absorb even the present output. As a result of the collapse in grain exports, due to bad crops, the Soviet Government can maintain its foreign trade balance only by finding substitute exports.

Owing to the high transport charges Russian coal was not exported even before the war, when the European market was more favorable, and native coal could not compete with British in the industrial district of Petrograd. Russian oil can compete, however, and there is a practically unlimited demand. The official *Ekonomitcheskaya Zhizn* therefore propounds a plan for consuming coal instead of oil where possible at home, and for correspondingly increasing the export of oil. Of the total fuel consumption before the war, 47 per cent was coal, 37 per cent wood, 13 per cent oil, and 3 per cent peat. As the wood supply, except in the North, is failing, a largely increased coal consumption, says *Ekonomitcheskaya Zhizn*, is practicable, especially on the railroads, but the change involves heavy capital expenditure.

The output of coal in the coal year 1924 was 865,000,000 poods (1 pood equals 36.07 lb.) as against 270,000,000 in 1920, and 1,544,000,000 in 1913. The official program for the new coal year (Oct. 1924 to Sept. 1925) is 887,500,000 poods. Estimated output of the chief State Trusts, as compared with the preceding year is (in millions of poods):

| | 1925 | 1924 |
|---|---|---|
| Great Donetz Trust........ | 554 | 530½ |
| Little Donetz Trust ........ | 40 | 42 |
| Southern Steel Trust ........ | 118 | 89 |
| Chemical Coal Trust......... | 25½ | 27½ |
| Moscow District Mines ...... | 39 | 40 |
| Kuznetsk Trust ............ | 49 | 50 |
| Black Earth Trust .......... | 42 | 39 |

The actual production in the three months October to December, 1924, was 200,500,000 poods; January, 1925, 74,200,000 poods; February, 80,400,000 poods; March, 83,900,000 poods; in all 439,000,000 poods, which for the six months is almost exactly half the year's production estimated in the program.

Financially the condition of the coal trusts continues unsatisfactory, although operation is increasing in efficiency. All the trusts have heavy bank debts and at the beginning of this year the chief Donetz Trust (Donugol) owed its employees 7,500,000 rubles for arrears in wages. A project was submitted to the Moscow Council of National Economy for dissolution of this trust, and its reorganization in the form of a number of minor concerns.

The number of miners employed in most of the trust mines is decreasing. Per capita output, however, has increased 37 per cent since October, 1923. As wages in the same time have increased only 25 per cent, more economical operation ought to be assured, but the trusts are crushed by bureaucratic and overhead expenditure, and with few exceptions only those small and remote mining concerns which are almost free from Communist control show profits.

Market conditions have radically changed during the last four or five years. Whereas in the first years of the Soviet régime production was kept down primarily by general disorganization and unwillingness to work, to-day production could easily be increased if only markets could be found. The weakness of the home market is due to the stagnation of industry, especially the iron trade. For domestic heating wood has always been most used, and wood and oil also played important rôles as railroad fuel.

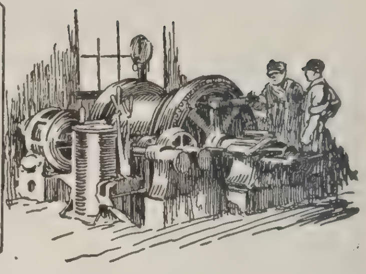
The geographical distribution of coal largely determined the distribution of industries. The South, where the Donetz basin contains sixty billion tons of coal underground, the Moscow district with twelve billion tons, and the Urals with 700,000,000 tons became industrial centers. As in Germany, and for the same reason, the heavy iron and steel industry developed most near the national frontiers. Since the war the Moscow coal district has developed relatively at the cost of the much more important Donetz basin. This is due to various causes, such as the civil war which kept South Russia in disorder, the breakdown of the railways, which made it difficult to transport Donetz coal, and the concentration of armament production around Moscow during and after the Great War.

Even the Ural coal industry has suffered less than the Donetz, and the Ural iron and steel industry has correspondingly maintained itself better than the much greater South Russian industry. In 1913 the iron and steel industry consumed 520,000,000 poods of coal, or about one-third of the whole national output. The revival of the steel industry therefore is the condition precedent to a return of coal production to anything like pre-war level.

**E. R. Pettebone Dies**

Mr. Pettebone, who was chief engineer of the Hudson Coal Co., died at his home at Kingston, Pa., July 27, aged 61. Death was due to a heart attack. Associated with the anthracite industry for thirty-six years, Mr. Pettebone was recognized as a leading authority on mining in the country. He was very well known in Scranton and had been connected with the Hudson Coal Co. since 1897. Previous to that he was with the Lehigh & Wilkes-Barre Coal Co. for nine years.

# Practical Pointers For Electrical And Mechanical Men



## Mending Jig Employed in Splicing Broken Steel Tape

Although the steel tape is probably the most accurate and convenient measuring device in common use it possesses the disadvantage that it breaks easily. Only a slight pull on a kink in such a tape is sufficient to snap it, thus ruining its usefulness until it can be repaired. So common is the breakage of steel tapes that special means for mending them are regularly sold by several well-known dealers in surveyors' instruments.

Tape splices may be made either in the field or in the office, but for certain obvious reasons the office is to be preferred. A convenient jig for repairing broken steel tapes has been devised by the engineering corps of the Sunlight Coal Co., of Boonville, Ind. As may be seen from the accompanying illustrations this device is extremely simple and is intended for use in conjunction with Eureka splice sleeves or similar means of repair.

### Procedure Is Simple

Splices of this kind consist of a thin steel sleeve which has low-temperature solder and the necessary flux on its inner surface. In repairing a tape by this means the broken ends are first polished with a bit of sandpaper or emery cloth, after which they are butted together within the sleeve, to the outside of which heat is applied. Two matches of the ordinary "parlor" variety, as a rule, will furnish enough heat to make a splice.

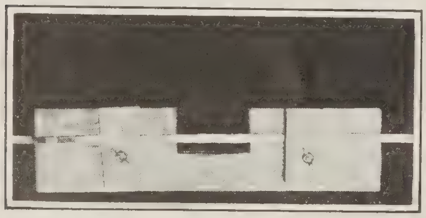


**Fig. 1—Ready to Make Splice**

The broken ends of the tape have been polished, butted together within the splicing sleeve, the two ends aligned and the clamps tightened ready for applying heat to the splice.

It is difficult, however, to hold a broken tape in the hands with sufficient steadiness to get the two parts in exact alignment when the job is completed, and sighting along the tape will usually reveal a more or less pronounced change of direction at the splice. The jig obviates this difficulty.

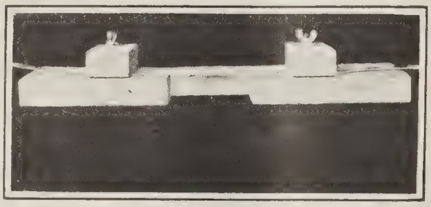

**Fig. 2—The Splice Completed**

This shows the splice as it cools. It only takes a few minutes to mend a tape and the great advantage of the jig lies in the fact that it holds the two pieces of the tape rigid assuring a "straight" splice.

As may be seen, it consists of a board with a rectangular notch cut in one side and two clamps to hold the tape firmly in position. A line drawn across the two ends of the board serves as a means for bringing the two pieces of the tape into exact alignment.

### Repair Is Quickly Made

In use the ends of the tape are polished and then butted together within the splicing sleeve. The clamps on the jig are then loosened, the tape slipped into place, the two pieces brought into exact alignment by making the corresponding edge of both pieces coincide with the mark on the jig, after which the clamps are screwed down tight. This holds the splice rigid and in correct position within the notch. The heat from two matches is then applied to the sleeve, after which it is allowed to cool and the tape is again ready for service.

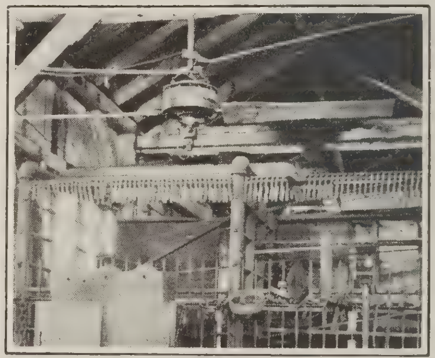
## Blacksmiths Install Ceiling Fan

Keeping even reasonably cool in a blacksmith shop on a hot day sometimes is a problem of no mean proportions. Not only is excessive heat in such a place uncomfortable but, because of this fact, it interferes with the quantity and quality of each workman's output. Any reasonable means that may be adopted, therefore, to alleviate the blacksmith's discomfort is advantageous to all concerned.

In the vicinity of Wilkes-Barre, Pa., somebody threw away an old ceiling fan of the kind and type often used in restaurants, laundries and similar places. The original owner doubtless believed that it had served its term of usefulness, was broken, worn out and useless. One of the blacksmiths employed by the Kingston Coal Co. espied the remains of this old motor on the dump and promptly acquired it.

Carrying it to the shop he and his fellow workers, including one that was somewhat of an electrician, overhauled and repaired it until it would once more operate properly. They then mounted it from the roof of the shop, braced it and bolted a suitable strip of wood or paddle to each of its arms.

The accompanying illustration shows the result of their labors.



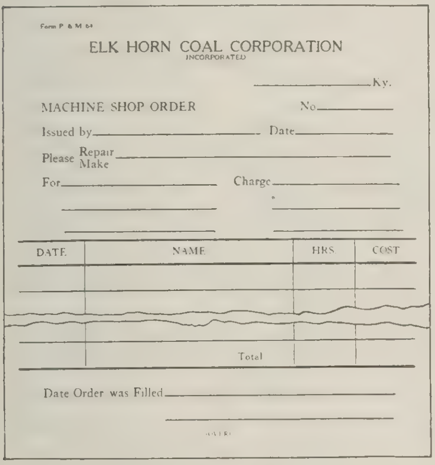
**Ready for Business**

This fan was stopped just long enough to be photographed. It was salvaged, repaired, mounted, wired and is now used by the balcksmiths themselves. It now does much to relieve the heat of the shop.

This old, discarded fan now does much to alleviate the heat of the shop on a warm day. And although this motor consumes an appreciable amount of electric current the management is well pleased because the men at the forges, being more comfortable, are able to turn out more work and of a better quality than would be the case if it were not for this little machine's cooling breeze.

## Shop Work Records Help Fix Exact Cost Data

The accounting of repair work done at the shops of the Elkhorn Coal Corporation at Wayland, Ky., is kept by the warehouse man and so far as can be seen adds practically no expense to shop work. Each job is assigned a number and if it is a repair job a tag bearing that number is attached to the equipment. Each mechanic makes out a card, at the end of the day distributing his time to the various job numbers on which he worked. As he leaves the shop he drops this card in a box at the storehouse. The storekeeper posts this labor on the front side of a job sheet, such as is illustrated, and as items of material are drawn out for use on a job he also posts that data on the back where a form is provided. When a job is completed the total cost is figured by adding the labor and material items.



Form P & M 64

ELK HORN COAL CORPORATION
INCORPORATED

______________ Ky.

MACHINE SHOP ORDER No.______

Issued by______________ Date______

Please Repair / Make ______________

For______________ Charge______________

| DATE | NAME | HRS. | COST |
|---|---|---|---|
| | | | |
| | | | |
| | Total | | |

Date Order was Filled______________

(OVER)

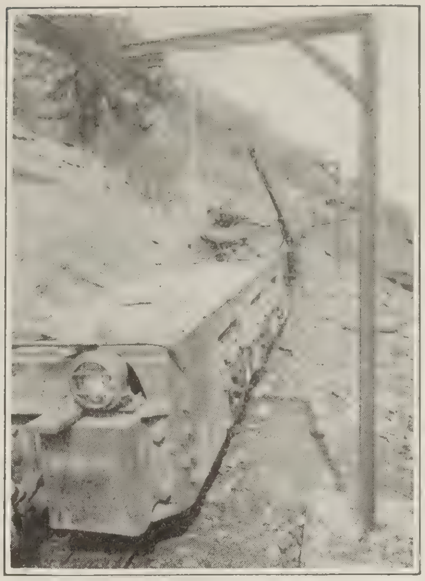
**Machine Shop Blank**

Repair shop cost data is valuable as a means of holding down expense, but must be kept by some method which will not add appreciable cost to the work. A sheet, as above, is used for each job. The labor items are posted on the front, and the material on the back.

## Old Rails Find New Use

Much of the material used around many mines is abandoned as soon as it has served its original purpose. An example of how old rails may be reused after they have become unsatisfactory is illustrated in the accompanying photograph.

At the Gay Coal & Coke Co. mine in West Virginia, permanent overhead structures for supporting the trolley wire are made from the mine rails which have been removed from underground. Sometimes these old pieces of rail are too short to be used again for mine tracks or have been worn so that locomotives and cars will not ride upon them without derailing.



**Old Rails Need Not Be Scrapped**

Pieces which ordinarily would be wasted are used to make these trolley wire supports. Set in concrete they make overhead construction rigid and permanent.

Many different types of trolley wire braces are not permanent; being constructed of wood they are easily broken. The supports in the illustration are set in concrete and, therefore, are built to "stay put."

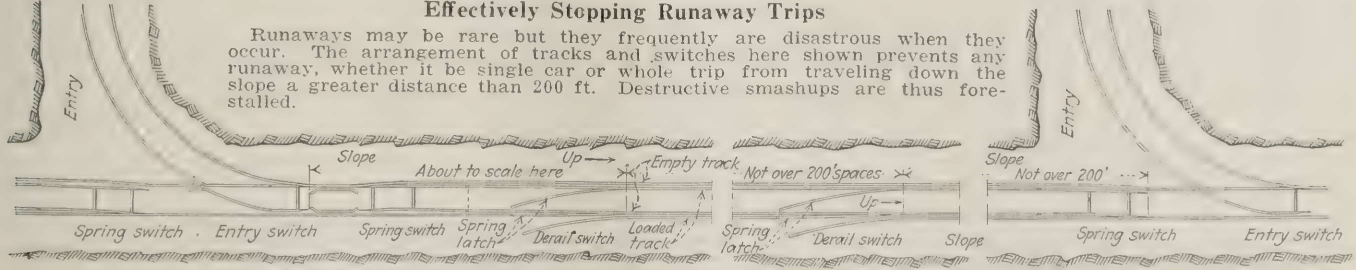
The work of assembling the parts is done at the mine. Holes are drilled in the rail sections so that a corner can be formed. The short horizontal arm which extends over the track and holds the trolley wire is held in position by two corner braces. Attached to the rails is a piece of strap iron which holds the top member rigidly in place.

## Slope Runaways Checked by Derail Switch

At the Rock Springs mines of the Union Pacific Coal Co., the derailing switches shown in the accompanying illustration have been installed to stop runaway trips. The track on the slope is practically double except at entry or level turnouts. Thus the loaded cars coming up traverse one set of rails while the empties going down follow another. Spring-actuated derail switches are installed on the loaded track in such a way that they will effectively untrack any loaded trip moving down the slope. These spring switches are not over 200 ft. apart.

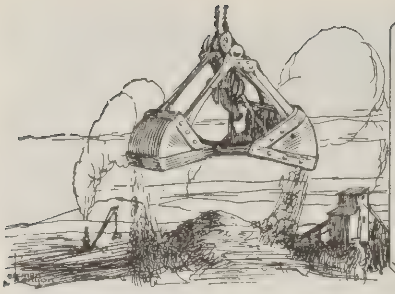
By this arrangement, should the cable part at any point while a trip of loads is being hoisted, such a trip could not run down the slope over 200 ft. without encountering a derail switch and being untracked. An empty trip pushed over the knuckle at the tipple without being attached to the rope would be thrown off the track by the manually operated derail installed outside the slope collar and controlled from the tipple platform.

Of course ropes, shackles, swivels and the like employed upon any slope should be carefully and periodically inspected, any part or portion showing signs of defect or weakness being promptly repaired or renewed. In spite of all due vigilence, however, trips will occasionally break loose and run wild. It is upon these critical, albeit rare, occasions that the arrangement here shown serves its purpose.

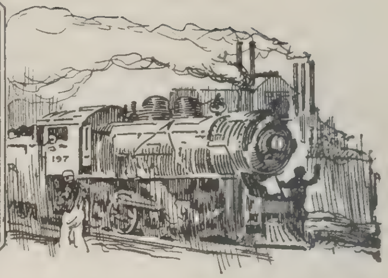


**Effectively Stopping Runaway Trips**

Runaways may be rare but they frequently are disastrous when they occur. The arrangement of tracks and switches here shown prevents any runaway, whether it be single car or whole trip from traveling down the slope a greater distance than 200 ft. Destructive smashups are thus forestalled.



# Production And the Market



## Improvement in Soft-Coal Market More Marked; Anthracite Trade Extremely Active

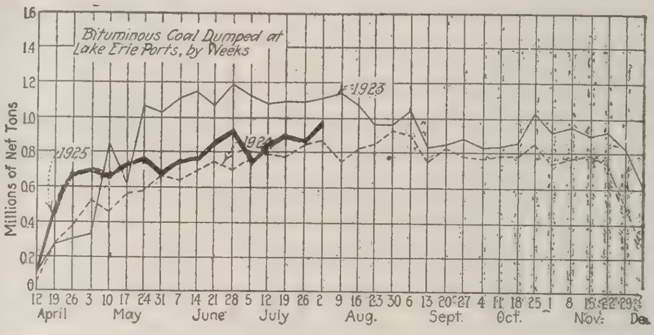
The improving tendency in the bituminous coal trade is becoming more marked, and the volume of inquiry would indicate that the betterment will continue. While output is increasing with the demand the augmentation in tonnage has not been sufficient to outpace the expansion in business, consequently prices show a steady growth in firmness.

Illinois and Indiana domestic coals were more active in the Midwestern market last week than at any time in months—in anticipation of a 25c. advance in price. Many of the mines were able to clear their tracks for the first time since last winter. Steam coals are erratic, however. Kentucky continues to enjoy a heavy movement to the lakes and industrial and utility demand is keeping screenings moving at very good prices for midsummer. Prepared coal also is moving better. Output is increasing in eastern Kentucky and western Kentucky also is doing better. Although demand at the head of the lakes is not up to the mark the trade is more hopeful by reason of a growing volume of inquiry. Business is practically unchanged in Utah, Colorado, Kansas and the Southwest except for some activity in preparation for an upturn.

Domestic inquiry and demand at Cincinnati have picked up to such a degree as to stiffen prices and iron out most of the spreads, the improvement extending right down the line to slack. Southern and eastern Ohio are doing little more than mark time, partly stunned by the Interstate Commerce Commission's refusal to alter rates to the lakes. Sluggishness continues to prevail in the Pittsburgh market. The New England and New York markets are gaining steadily in firmness, but at Philadelphia demand is only fair. Baltimore and Birmingham are barely holding their own.

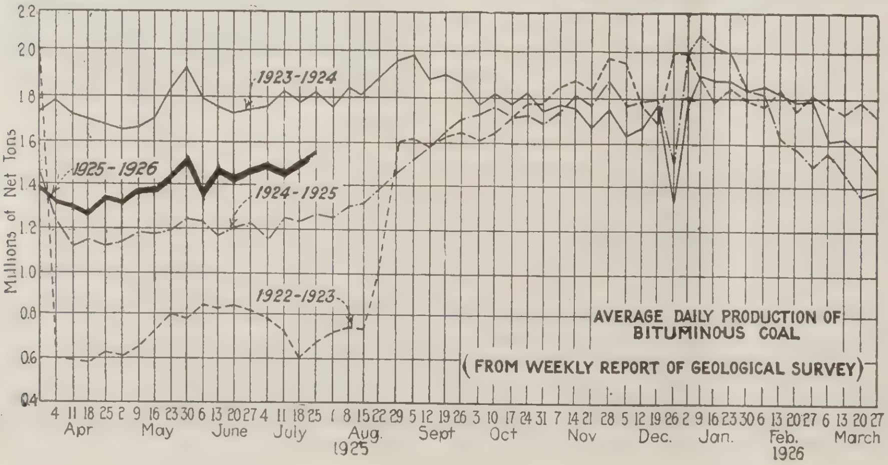
The hard-coal market continues to speed up, the companies having orders booked to take care of most of their August output. Demand for all sizes has increased, enabling the mines to work full time and bring output close to normal. Stove and egg are a little tighter, but chestnut, pea and the steam sizes also have braced to some extent. Independent prices are gaining in strength and the companies added 10c. to 15c. to the price of domestic sizes on Aug. 1.

Production of bituminous coal in the week ende July 25 is estimated by the Geological Survey at 9,255,000 net tons, compared with 8,966,000 tons in the previous week, as shown by revised figures. Anthracite output in the week ended July 25 totaled 2,049,000 net tons, compared with 1,985,000 tons in the preceding week.



*Coal Age* Index of spot prices of bituminous coal advanced three points during the past week, standing on Aug. 3 at 163, the corresponding price being $1.97.

Dumpings at Lake Erie ports during the week ended Aug. 2, according to the Ore & Coal Exchange, were: Cargo, 942,678 net tons; steamship fuel, 45,318 tons—a total of 987,996 net tons, compared with 845,706 tons in the previous week. Hampton Roads dumpings in the week ended July 30 totaled 445,793 net tons, compared with 408,064 tons in the preceding week.



### Estimates of Production

(Net Tons)

| BITUMINOUS | 1924 | 1925 |
|---|---|---|
| July 11 | 7,742,000 | 8,639,000 |
| July 18 (*a*) | 7,644,000 | 8,966,000 |
| July 25 (*b*) | 7,785,000 | 9,255,000 |
| Daily average | 1,298,000 | 1,542,000 |
| Cal. yr. to date | 258,856,000 | 265,991,000 |
| Daily ab. to date | 1,488,000 | 1,527,000 |
| **ANTHRACITE** | | |
| July 11 | 1,871,000 | 1,854,000 |
| July 18 | 1,840,000 | 1,985,000 |
| July 25 | 1,837,000 | 2,049,000 |
| Cal. yr. to date | (*c*) 51,989,000 | 51,837,000 |
| **COKE** | | |
| July 18 (*a*) | 103,000 | 127,000 |
| July 25 (*b*) | 99,000 | 125,000 |
| Cal. yr. to date | (*c*) 6,406,000 | 5,731,000 |

(*a*) Revised since last report. (*b*) Subject to revision. (*c*) Minus two days' production to equalize number of days in the two years.

### Midwest Market Unusually Active

The Midwest market on Illinois and Indiana domestic coals was much more active last week than it has been in months. This was principally because the operators gave notice that effective Aug. 1 prices would advance 25c. a ton to $3 on the coarser prepared sizes. So many orders came in during the last week in July that a great many of the mines cleared their tracks—something they have not been able to do since last winter. Retailers were particularly active in this buying wave, as strike talk apparently has had its effect on the public, who are now actually showing some interest in coal.

The market in steam coals continues to be fairly erratic. The operators who are obtaining the best prices are the ones who pursue the policy of staying out of the market and letting customers come to them for prices. These operators are not offering their coal indiscriminately, nor are any of them shipping coal on consignment.

Industries in the Chicago district have not as yet started to buy, but it is anticipated that they will be in the market strong within the next three or four weeks, and when they do come in, sharp advances can be expected.

Smokeless operators are out with early August quotations, none of them having set prices for the entire month. All of the companies selling first-class smokeless coal are holding it at a consistent price of $3.25 for lump and egg. Splint coal shows a little strength, as the average price for 6-in. is around $2.50; 3-in. block around $2.25. The spread on good eastern Kentucky block is $2.45@$2.75; Kentucky egg, $2@$2.50.

There is greater activity in the movement of domestic sizes in Franklin County and Saline County, but Williamson County is coming along slowly. Some of the older mines are beginning to open up and those that are working are getting better time. Nut coal, however, is heavy and domestic shipments are pretty well scattered in all directions except South. Steam seems to be equal to the demand and at some plants a little crushing is still going on. Railroad tonnage with the shaft mines is fairly good and the strip mines report good railroad tonnage and fairly good steam and some increase in domestic. The strip mines are getting almost full working time. Shaft mines are working two to three days a week as a rule.

In the Duquoin field conditions are a little slow, with poor working time and no movement of coal. The few mines that are working are getting two and three days a week. In the Mt. Olive field conditions still continue bad. There is a slight increase in domestic but not enough to become a factor. Mines are still crushing mine-run for screening contracts. Railroad tonnage is light. In the Standard field there has been some improvement in work-

Coal Age Index of Spot Prices of Bituminous Coal F.O.B. Mines

| | 1925 | | | 1925 |
|---|---|---|---|---|
| | Aug. 3 | July 27 | July 20 | Aug. 4 |
| Index | 163 | 160 | 160 | 163 |
| Weighted average price | $1.97 | $1.94 | $1.93 | $1.98 |

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States, weighted first with respect to he proportions each of slack, prepared and run-of-mine normally shipped, and, second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke; 1913-1918," published by the Geological Survey and the War Industries Board.

ing time and demand, but there is an overproduction that is selling below cost and nearly all mines have "no bills" and the buyer fixes his own price. Steam market in the Standard field is weakening and the general situation is bad, with no hope of any immediate relief. Railroad tonnage is fairly good, everything considered, and the mines are working from one to three days a week, this being the exception. Prices are unchanged.

At St. Louis there has been a little spurt in domestic deliveries of high-grade coal. This has just started and may assume a reasonably good movement soon. Anthracite, smokeless and coke are slow and the cheaper coals, while active for winter storage in tenements and schools, apparently are not in favor in a general way with the domestic user. Wagonload steam is quiet and carload is not equal to the supply. From now on there will be a tendency to find the steam market weakening. Country domestic is picking up a little on good and medium coals, but country steam is slow.

### General Conditions Better in Kentucky

Now that Kentucky's lake business has been made safer by the Interstate Commerce Commission decision that rates from the various competing fields will continue unchanged, there is an air of confidence in the fields, although many wise operators never seriously thought that there was much prospect of any upset in the order of things.

Lake movement continues quite heavy, while industrial and utility demand is keeping screenings well cleaned up at the best midsummer prices in some years. Movement of prepared coal is gradually increasing as retailers are stocking and domestic buyers placing winter orders. Eastern Kentucky mines are gradually increasing production, some mines which had been idle for months now running steadily.

Eastern Kentucky as a whole is fairly well fixed, with screenings rarely reported at under a minimum of $1 and a lot of coal moving at $2 to $2.25, the top price on special coals ranging from $2.50 upward.

There also has been an improvement in western Kentucky, where some houses are putting out August quotations at $1.85 for best block, lump and egg. Block is now quoted on a spot basis at $1.75@$1.85; lump and egg, $1.50@$1.75, covering a range in sizes; nut, $1.45@$1.60, also covering a number of sizes; and mine-run, $1.10@$1.25. Screenings are 85c.@95c. A number of mines are on much better running time and one mine recently broke its previous hoisting record. Strip mines also are producing well.

Indications are for steady increase in production, with prices rising slowly as demand gets into full movement.

### Northwest Trade Below Par but Hopeful

While demand for coal in Duluth remains below par, improvement in inquiry is noted by dock operators. The trade therefore is more hopeful. Retailers at Duluth, Superior and in other towns in Minnesota and North Dakota have been prodding large consumers to order anthracite supplies for the winter, and with fair success, but the rank and file of anthracite consumers are holding off, regardless of strike talk. Pocahontas and other bituminous substitutes seem destined to make further inroads into the anthracite trade.

The dock companies are deriving some satisfaction from a better demand lately from industrial quarters. Demand from iron mining companies on the Minnesota ranges remains lifeless as a result of operations being curtailed apart from at the mines of the Oliver Iron Mining Co. Some of the independents, however, are understood to be preparing to start up again this fall.

Receipts of coal by lake fell off during the last week, the aggregate being thirty-seven cargoes, including two of anthracite, as compared with forty-eight cargoes, including nine of anthracite, during the preceding week.

Prices are unchanged for bituminous coals, but an advance of 10c. per ton became effective on anthracite on Aug. 1, quotations being as follows: Egg, $13.10; stove, $13.20; nut, $13.35; pea, $10.10 and buckwheat, $6.50.

Dock managers in Milwaukee report a better demand for coal, which now is moving out in an encouraging way, though there has been an advance in price at the mines for some grades of bituminous coal—as much as 25c. a ton. On Aug. 1 retailers made the usual advance of 10c. a ton in the prices of the various sizes of anthracite. This will make the price of egg $16.20; stove, $16.70, and nut, $16.55, with 75c. added if the coal is carried from truck to bin. Coal is coming up the lakes quite freely; receipts for the season up to July 30 aggregate 1,599,298 tons, against 1,350,246 tons to the same date in 1924.

### Southwest Prepares for More Business

With little change in market conditions in the Southwest, the price of Kansas lump was advanced 25c. to $4.25 on Aug. 1, and there is general activity over the state in preparation for fall business. Oklahoma production is more or less limited by union opposition to the 1917 scale, under which all coal is being produced there. Mass meetings are frequent, with national guardsmen present to prevent disorder. In Arkansas in recent weeks several mines have reopened under the lower scale, but so far production under the 1924 scale is limited. Operators bound by it say they do not know when they will be able to open.

There have been no new developments of note in the Colorado market, the volume of demand and prices being practically unchanged during the last week.

The coal market in Utah continues draggy, but prices remain as firm as ever. Mines are working about two or two and a half days a week. Winter storage orders are still coming in slowly, the winter storage idea during summer apparently having been abandoned by most people.

### All Grades Stiffen at Cincinnati

While there has been a definite upturn in prices on the Cincinnati market it only to a measure reflects the strength shown during the past week, for in gaining momentum the spreads and other little evasions in prices had to be first wiped away. Domestic inquiry and orders are the most important new turn to affairs. Retailers and country dealers who had been lagging for some time show a disposition to buy, but instead of their orders being seized with avidity there were instances where they were told that they would have to wait their turn. Even more surprising was the fact that $2 coal had disappeared overnight, as it were, and the asked price was $2.25@$2.50 with Elkhorns, Yellow Jackets, Millers Creek and the like up to $2.75 and even higher.

Slack, too, under Eastern buying for tidewater also has perked up with $1.10 as a positive low and some purchases running as high as $1.25. The consequence of this was that the residue from byproduct coals and others used for specific purposes went sailing up to $1.35. Lake buyers are beginning to scent the change in the trend of events and with their entry into the market for 2-in. sizings egg and nut are stiffer in price though the quotations of $1.65@$1.85 fail to show this.

In smokeless business has been a little slower in showing the turn so far as the inland is concerned, but again the seaboard came to the rescue and advanced the price on screenings, some sales having been made around $1.35 with the $1.25 price practically wiped out. On lump and egg the price has tightened down to $3, which can be looked upon as a 25c. advance for it has been hard to determine, for the past month or six weeks, just where the egg left off and the lump commenced. Mine-run is strong.

Retail business is still lagging so far as the city is concerned. The public, once more bitten last year so far as price was concerned, refuses to take the anthracite and foreign troubles seriously and shows no haste in getting coal into the cellars. Pocahontas lump was advanced to $8 as of Aug. 1 and mine-run to $6@$6.25; bituminous lump to $6@$6.25 and slack to $4.50.

River business again had to depend upon a wave from the upper regions, the water from the heavy rains having run out of the stream. Thirty thousand tons was brought in on the morning of July 30.

With the strike question both in the anthracite field and in Great Britain still unsettled, coal men in Columbus and various Ohio fields are playing a waiting game. There is still a slightly better demand for domestic sizes, attributable both to the labor situation and the lateness of the summer stocking season, but the tonnage moving is not up to normal for this time of the year, as many householders are still holding back.

Ohio coals both from the Hocking Valley proper and the Pomeroy field are moving in slightly larger quantities, although production has not increased materially. Retail prices are steady at the levels which have maintained for several weeks. Smokeless is selling around $8 to $8.50 and splints about $1 less.

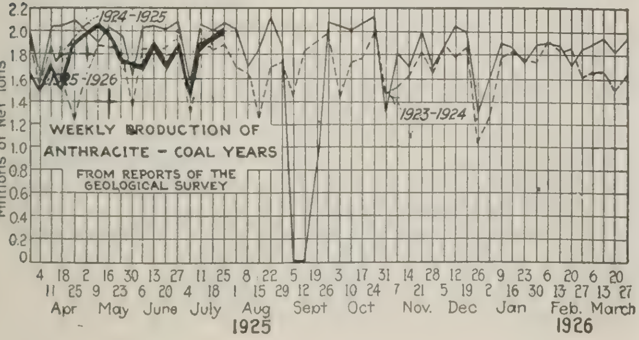
Steam business is irregular, as there is no general movement to stock. Reserves are about normal as a rule, although some reports show very low stocks in the hands of some of the larger consumers. With only a small amount of distress coal available buyers are placing small orders with operators in preference to entering into contracts. Inquiries for contract prices are more numerous, however.

Aside from the fluctuation in the supply and price of slack and nut and slack, there is little if any change in the eastern Ohio market. During the past week screenings have been scarcer, due to the comparatively small quantity of lump being produced, with the result that spot prices have stiffened 5c. per ton.

The general industrial situation shows no improvement, and coal consumers have not yet actually commenced laying by much fuel.

In the retail trade accumulation has already begun, but the major commitments are for smokeless domestic from West Virginia. The mines prices on these coals as quoted in Cleveland have been advanced 25c. per ton within the past week with the demand stronger.

Production in the eastern Ohio No. 8 field in the week ended July 25 was 236,000 tons, or about 33.7 per cent of potential capacity. This is 21,000 tons over the preceding week but 41,000 tons under the corresponding week last year.



### Demand Lags at Pittsburgh

In the Pittsburgh district proper there is no plainly discernible increase in demand for coal, but in adjacent non-union regions a little better call seems to be in evidence, and some operators have hope that they will soon be able to obtain better prices. This is the experience of some Connellsville operators who are selling coal for gas purposes, the coal not being equal to regular Youghiogheny gas coal but an acceptable substitute, at a price, with some consumers. The Group 1 mines of the Bessemer district (north of Butler), producing steam and domestic coal, have had a slightly better demand in the past few weeks, and claim to be operating at close to 75 per cent.

A small union mine in the southwestern part of the Pittsburgh district has just closed, being unable or unwilling longer to stand the loss of operating at the union scale and meeting the market.

The coal situation at Buffalo turns now on the possibility of a strike. Not much dependence is placed on the threatened interference of the government. The local natural gas company has brought a storm of objection down upon it by asking an advance of 15c. per thousand feet for gas furnished the city. Practically every concern, from the City Council down to individual consumers, is up in arms against the move. It is in the air that the cost of fuel must come down. The bituminous trade is quite as dull as ever. Nobody finds the demand any better and some shippers are not finding their trade as good as it was. Slack is scarce and it may be that sizes will stiffen before long also, but so far a few cents advance on Youghiogheny gas slack is about all the change in sight.

With the prospects of a coal strike in the near future, Toronto householders are keeping retail dealers busy filling orders. The rush has lasted for several weeks now and shows no signs of slackening. Supplies are still coming in, and with the exception of stove coal there is no scarcity. Dealers are hoping that the strike may be averted before any real scarcity makes itself felt. Prices are unchanged.

### New England Situation Steadier

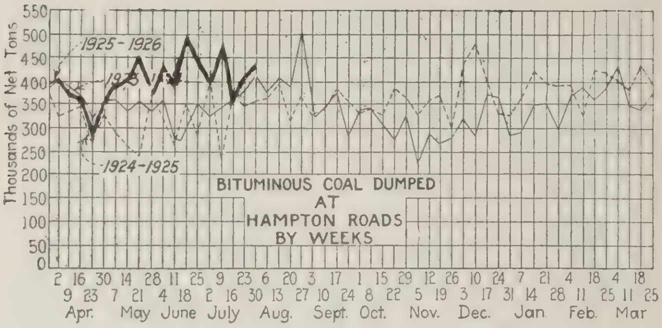
In New England the improved situation reported a week ago has been reasonably well maintained. The increase in demand, if any, is very slight, but prices are on a firm basis once more and there are few indications of shading in order to move coal. The British labor difficulty was a talking point for a fortnight, but there were no signs of comprehensive buying from foreign quarters. Production in the smokeless fields is under better control, accumulations at the piers are much less than during May and June, and it is clear that requirements and the volume of coal are being co-ordinated in much better fashion than has been customary hitherto this season. Factors who were assuming coal would be waiting for their ships as matter of course now find it necessary to arrange for cargoes weeks in advance, and obviously this is a much more wholesome state of trade.

While good grades are still to be had at $4.35 per gross ton f.o.b. vessel at Norfolk and Newport News, the actual range of the market on Navy standard Pocahontas and New River is $4.35@$4.50, with occasional sales of small lots on a slightly higher basis. Somewhat firmer marine rates on steamers have encouraged rehandlers at this end to raise their asking figures to $5.75 on cars Boston, but business is still being taken for August and September delivery at $5.50@$5.60. The Boston retail market also is much improved, dealers having pegged their price at $7.50 per net ton delivered, although the cream of the tonnage was placed earlier at around $6.

On Pennsylvania coal there is no change. The high cost of mining keeps prices still far above what the market will absorb in any volume, and there is not yet any opening all-rail in competition with Pocahontas and New River.

### Demand Growing at New York

An increased amount of bituminous coal is being called for steadily by New York buyers, and there is every prospect of the improvement continuing through August. Over and beyond this seasonal tendency to expand, the work of corralling orders will be facilitated in the next few weeks by the danger of trouble in the anthracite fields. Prices have not risen except in spots, and until there is a broad



advance, embracing all grades of coal, the bituminous trade as a whole will not be on a profitable basis.

The volume of inquiries now coming in shows that consumers of soft coal are no longer indifferent. Some are holding back but every week sees a certain amount of business closed that had been hanging fire, and taking it all around the local wholesale trade is in a more hopeful mood than for some time past.

At Philadelphia there is only an ordinary demand for soft coal, with all producers in readiness to take advantage of any quickened call. The better movement among the medium users of coal to put stocks in storage continues and inquiries are increasing, although there is still a tendency to shop around to get the lowest figures.

The railroads are holding off, though some tonnage has been placed lately in high-volatile coals where the price was favorable to the buyer. With the possibility of an anthracite strike producers are not so anxious to close railroad trade at the prices now offered, and as the roads have big stocks there is indifference on both sides.

The outlook industrially is favorable for good fall business and this fact is giving much encouragement to local selling houses.

The tide trade remains quiet, although hopes are strong that the increased call for fuel evident at some of the Southern ports may reach here soon. Bunkering goes on at the ordinary rate in evidence for the past year, and prices are unchanged.

One result of the settlement of the threatened British coal strike probably will be that the export and bunker trade at Baltimore will progress along more normal lines than would have been the case had the English coal supplying group been forced to come into the market for German or American coals. Coal men are confident that there is enough hard coal in reserve to take care of a considerable period if there be a strike, and that the effect on soft coal will be only a moderately increased demand for certain domestic steam sizes that will in no way greatly accelerate soft-coal buying. Meanwhile sales competition is keen and prices remain about the same as they have been for some weeks past.

## Birmingham Expects Improvement

At Birmingham the market for domestic fuel continues very sluggish, with scarcely any spot demand and a very limited and slow movement against contracts. Coal men expect an improvement in conditions with the beginning of August, contracts calling for the delivery of a much larger tonnage than specified for July and preceding months. Householders so far have evinced little interest in stocking winter fuel and consequently dealers, having fair stocks, are in no mood to further augment them until they have booked a fair amount of retail orders. Mines have managed to move their domestic output so far by unusual effort. Prices on all high grades of coal have been maintained and the usual increase became effective Aug. 1 except on Big Seam and similar grades. August prices on Cahaba lump are $4.05@$4.80; Black Creek, $4.30; Corona, $3.35; Carbon Hill, $3.10; Montevallo, $4.55@$5.30; Big Seam, $1.75@$2.25.

Steam coal buying is about normal for this season and spot business is sufficient to keep the mines going with their contract obligations in hand. There is little or no surplus coal and quotations are stable on the schedules which have been supported by the market for the last two months or more. General industrial consumption through contract agreements is large, utilities, railroads and coke-making requiring a heavy tonnage. The bunker trade is reported as very quiet at present.

## Hard Coal Trade More Active

At New York the anthracite market shows considerable activity. The companies already have orders booked to care for the bulk of their August tonnage, these having been accepted subject to prices prevailing at date of shipment. In the rising market the policy of the independents is to sell from week to week only, or even from day to day, in order to get the full benefit of advancing prices.

Retailers are buying heavily to meet current demand and to build up stocks. Dealers report they have all the business they can handle. Some are working the strike scare for all it is worth, while others are putting the soft pedal on it lest they play into the hands of oil-burner salesmen.

The Philadelphia trade from all angles is fairly satisfactory. Demand for all sizes has strengthened much during the past seven days, the mines are making full time and production is close to normal.

Local retail demand is only ordinary, but some of the independents, mostly those who sell their coal through commission houses, have added considerably to their prices.

Stove has tightened up considerably and is not coming in freely, but there is no shortage. Much the same thing is true of egg, and while nut is still easy to get, there are signs that it too is in better demand. Pea has improved, but there is still a plentiful supply all around. Steam sizes have braced and company producers are coming close to moving every ton to market.

Retail prices of hard coal, except buckwheat, moved up 25c. per ton in Baltimore Aug. 1. During July, for which period there was a wholesale advance, the retail trade absorbed the increase and continued to sell to the general public at the same rates as quoted in June.

The Buffalo anthracite trade is still getting the benefit of the possible strike and retailers generally report good business. The prospect is that the beginning of September will see quite as much coal in cellars as in former seasons.

Some independents are getting higher prices, but it is hardly possible to sell that coal here.

There is a decided shortage of anthracite in this territory. The city retailers are able to get what they need and the rail line movement is pretty good, but there is next to no surplus for shipping by lake. Only four or five cargoes are now loaded into lake vessels in a week.

Coke sells moderately. There is every prospect of a much-increased demand for it when cold weather sets in, and the handlers of it will be many.

Lake shipments for the week were 37,800 tons, of which 13,300 tons cleared for Fort William, 9,500 tons for Duluth, 7,000 tons for Ashland, 6,000 tons for Milwaukee and 1,500 tons for the Sault.

## Connellsville Coke Market Unchanged

There was no change in the Connellsville coke market last week either in prices or volume of demand, though some operators have hope of obtaining extra business in coke as an anthracite substitute.

Demand for spot furnace coke is confined almost wholly to small lots for non-metallurgical consumers. The price holds at $2.90, to which it had advanced a week ago. There is no demand for spot coke from furnaces and no inquiry as to contracts. Furnaces using purchased coke are neither blowing in nor blowing out.

A non-ferrous metal interest which has been buying coke, not strictly standard furnace coke, in odd lots lately has put out an inquiry for a regular supply for a month or to the end of the year, as a feeler, presumably prompted by thought of the possibility of coke advancing on account of anthracite conditions.

Foundry coke for spot shipment remains dull, prices being unchanged at $3.75 to $4.25, with the higher price rarely paid. Specifications on contracts have not picked up as was expected.

# Foreign Market And Export News

## British Coal Market More Active; Output Slightly Higher

With the possibility of a stoppage in the Welsh coal trade at the end of the month there has been increasing activity in the shipment of coal and also in inland deliveries. Supplies of coal are not now available to any great extent. Foreign depot owners and other consumers, including South American, Egyptian and Irish railways, which have large contracts for Welsh coal, have taken steps to increase deliveries as far as possible. With the heavier shipments and reduced supplies offered colliery owners are holding out for better prices for any coal they have for disposal.

At Newcastle-on-Tyne the week opened with all classes showing a firm tone and sellers were fairly successful in getting the higher quotations. Inquiry is from all directions but chiefly from the Mediterranean and coaling stations.

Production by British coal mines in the week ended July 18, a cable to *Coal Age* states, totaled 4,890,000 tons, compared with 4,820,000 tons in the preceding week.

### French Industrial Grades Dull; House Coals More Active

The calm of the French coal market has not been lifted to any extent; in fact the movement of industrial grades is quite bad, though household fuels are somewhat more active.

The proposed reduction of railway freight tariffs so as to allow easier clearances from the French mines to the western region of the country has been rejected owing to the uncompromising attitude of the State Railways.

The French market has been expecting a strike at the British collieries and a number of importers have balked at accepting orders, not knowing if they would be able to execute them. This has given an impetus to sized dry descriptions and to French, Belgian and Dutch anthracite grades. German free coals have been arriving in small quantities.

The tax on production and imports of fuels, substituted for the tax on transactions, provides a rate of 1.70 per cent of the price on sales of coals and lignite and of 1.80 per cent on coke.

### Hampton Roads Coal Market Unsettled but Firm

Possibility of a hard-coal strike and its probable effects, unsettled the Hampton Roads market last week, cut down the supply of spot coal and increased the number of inquiries. The market was strengthened somewhat, but the trade was in a state of decided uncertainty as to how to move.

Shipments to Canada and to Europe appeared to be holding their own, but the business was mostly on long-time contracts. Very few shippers were willing to sell coal far ahead, and while they were not inclined to quote prices too low they still were skeptical of big advances.

### Belgian Coal Trade Worse

The situation in the Belgian coal market is getting worse week by week, industrial grades having taken a disastrous turn due to the strike of metallurgists and structural workers in the Charleroi Basin. Business is particularly bad also in the Borinage, where shutdowns of pits are more numerous. Stocks total around 2,400,000 tons.

Producers are well booked for sized products, particularly for sized dry grades, and refuse deliveries to outside markets. Sized anthracite products are quoted on the rise for movement inland.

# News Items From Field and Trade

## ALABAMA

Frank G. Long has been appointed superintendent at the Flat Creek Mines of the Alabama By-Product Corporation, succeeding J. D. Hollis, resigned.

The Alabama Mining Institute, J. J. Holmes Safety Association and local U. S. Bureau of Mines will sponsor the regular first-aid and field day meet, the date for which has been tentatively set for Oct. 6 at Birmingham.

A. W. Hudgens has been appointed manager of sales for the Alabama Fuel & Iron Co., one of the largest commercial coal producers in the Birmingham district, and will maintain his offices with the company in the Brown-Marx Building, Birmingham. Mr. Hudgens has been acting as executive official for the Galloway Coal Co. in charge of its Alabama operations for several years.

It is reported that the Cordova Brick Co. will develop a mine on its properties west of Cordova, where the company owns a large tract of land containing fine coal and fireclay deposits. The company will build a number of houses for employees, it is stated.

## ARKANSAS

Approximately 95 tons daily was loaded on the Midland Valley R.R. at the No. 2 mine of the Greenwood Coal Co., Greenwood, last week, following the opening of the mine under 1917 wage scale, according to reports. Fifty men are at work at the mine. The mine is one of the largest in the state.

The coal mine in the Shiloh community near Dardanelle is operating on full time and producing a large tonnage of coal.

Governor Terral has announced the appointment of Claude Speegle, of Hartford, to be state mine inspector to succeed Jesse Redyard, whose term expired. Mr. Speegle was appointed for two years. The state mine inspector's office is maintained at Fort Smith.

Members of the miners' union at Russellville have been raising funds with which to defray the expense of returning to their homes 53 penniless miners who came from Bristol, Tenn. The Tennessee workers were brought in, it was reported, to enter the employment of the Bernice Anthracite Coal Mining Co., with the assurance that a shortage of labor had necessitated the employment of non-union miners. Though no demonstration was made by the union men, the Tennessee miners decided to discuss means of getting back to Bristol after they were taken to the Bernice mines by an armed guard. The Bernice mine officials declared an open-shop policy several months ago.

## ILLINOIS

J. W. Fairbairn, Galesburgh, has found coal at a depth of 107 ft. on his farm five miles east of that city. Though geologists had given an unfavorable report, he persisted in his belief that he was on coal land. The vein is said to be nearly 5 ft. thick and of good quality. The Galesburgh Mining Co. will begin production Sept. 1.

Three mines, all of good size, reopened during the last week in July in the southern and south central district. The No. 15 mine of the O'Gara Coal Co. at Carrier Mills, resumed as did the No. 2 mine of the Saline County Coal Corporation at Ledford. Mine No. 12 at Witt, of the Indiana-Illinois Coal Corporation, also resumed operations after several months' idleness.

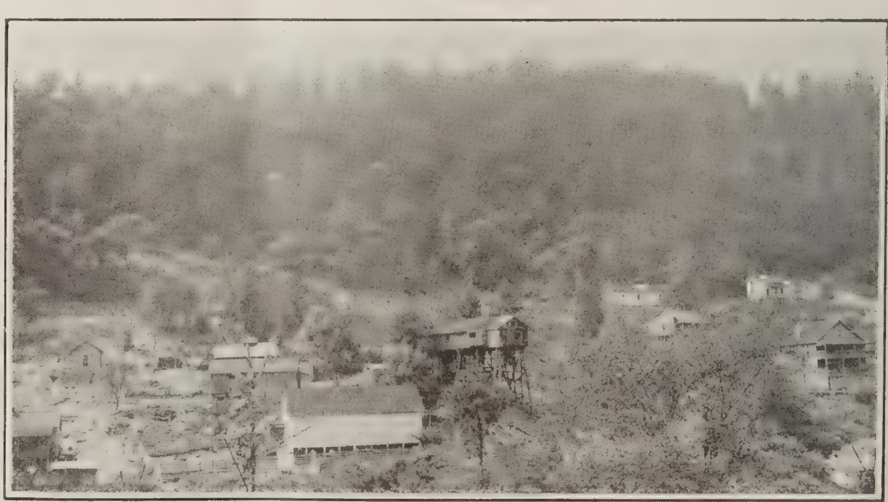
The Chicago, Burlington & Quincy R.R. announces the promotion of general agent C. J. Nelson, with headquarters in Herrin, to the position of general agent of the coal department with headquarters in Chicago. Mr. Nelson will assume his new duties at once and will be succeeded by A. F. Vogel, of Herrin.

The will of J. K. Dering, coal-mine owner and operator, which disposes of a $2,000,000 estate, leaves one-third to the widow, one sixth to a brother, Charles L. Dering; $200,000 to employees, one-tenth to charity, and the remainder to his son, Jackson K. Dering, Jr., when he attains the age of 30 years. Under the $200,000 provision for employees Joseph Roynon and James B. Pauley, were given $20,000 each and Duncan B. Bedill received $10,000. The will further provided that each employee in the Chicago office and in the personal service of Mr. Dering for ten years or more should receive $5,000; each employee for five years or more $2,500; each mine superintendent employed five years or longer, $2,500; each mine employee paid on a monthly basis and employed five years or more $1,000.

Wasson Mine No. 1, Herrin, which had been closed down for six weeks or more, resumed work July 16.

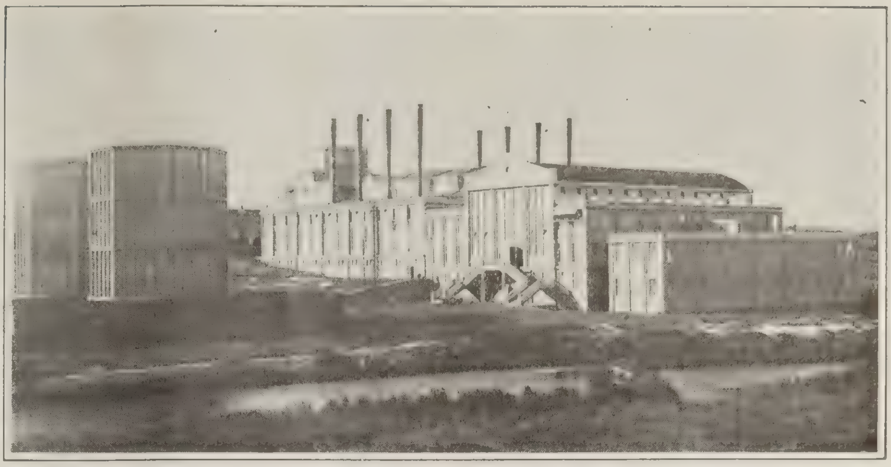
After a recent shutdown for repairs, the big No. 10 mine of the Indiana & Illinois Coal Corporation, at Nokomis, resumed operations July 23. Over 800 men who had been idle on account of the shutdown are back at work. Officials of the company expect that the shaft will work several days each week until cold weather, when full-time operations are looked for. The big shaft has a daily hoisting record of over 600 tons, and when operating at full capacity furnishes employment for 1,200 miners.

The Nason Coal Co. has been awarded the contract to supply the State of Illinois with coal for the following state institutions: Southern Illinois penitentiary, 9,000 tons; Menard State Hospital, 900 tons; State School at Geneva, 2,500 tons. The contract aggregates $50,000.



**Part of Village of Comargo Coal Co., LaColeman, Ky.**

In the center of the illustration is the tipple and receiving station for the cableway which conveys the coal across Big South Fork of the Cumberland River. The mine is served by the Kentucky & Tennessee Ry.



**Central Station of the Coal Mining Co. of Liévin, France**

The generators develop 30,000 kw. The cooling towers on the left and the chimney stacks in the shape of inverted cones will occasion notice.

## INDIANA

The Walters and Mattinly coal property, near Boonville, was sold to Fred J. Stock, Boonville, at a receiver's sale July 22.

The third shift of men employed at the Pike County Collieries Co., near Oakland City, has been temporarily laid off. The No. 1 and No. 2 shifts are working steadily and the No. 3 shift is expected to be put back to work soon.

The Cypress Creek Coal Co.'s property, four miles west of Boonville, was placed on the market July 25. The entire stock of the company, consisting of 2,000 shares, par value $50, was offered to the highest bidder. The Cypress Creek Mine, known as the "John Bull Mine," has for a number of years been one of the best producers in the Boonville district and is said to be one of the finest equipped mines in southern Indiana. It has a daily output of 1,200 tons.

## KANSAS

Mine No. 17 of the Jackson-Walker Coal & Mining Co., near Frontenac, was reopened with sixty men July 28 by Sam Thornburg and James Murphy, who are operating it under lease. The mine was closed several weeks ago to permit the installation of electrical equipment and a new shaker screen.

Officials of District 14, United Mine Workers, announced July 28, as the result of a series of conferences with operators of mines in the district which have not been working under contract with the union, that these operators had agreed to sign contracts and encourage the organization of workmen in their mines: The Jenkins Coal Co., the Big Five Coal Co., the Holt Coal Co. and the Overjohns Coal Co., operating Mayer No. 11. Men at the Jenkins shovel have been out of the union three years, while the Perfecto mine has been non-union two years.

Upon the agreement of the operators to withdraw the demand that all miners employed by them buy stock in the company, the strike called six weeks before at the Patton Coal & Mining Co.'s No. 5 mine was terminated July 15. The Patton company recently announced its intention to open Hamilton No. 7 under lease under a similar agreement, an announcement which likewise drew fire from union officials.

The Teerleen Coal Co., composed of L. G. Norris, Ed Brennan and W. E. Kelly, will start shovel operations on a 40-acre tract they own south of Mulberry, late in August. The bed they will work is from 34 to 36 in. thick with an 18 to 20 ft. overburden. Brennan and Kelly formerly were with the Republic Coal Co., at Minden, while Norris operates the Norris electro-shovel mine east of Croweburg. The mine is on the Kansas City Southern R.R.

Officials of District 14, United Mine Workers, aroused by alleged efforts of operators in the Henryetta (Okla.) field (District 21), to recruit miners from union ranks in Oistrict 14 to work under the 1917 scale in the Oklahoma field, have written all locals of the district urging them to combat the offers of the Oklahomans.

The Frisco R.R. has closed contracts with Kansas operators for approximately 500,000 tons of coal for the year ending March 31, 1926. While the quantity is the same as purchased from Kansas last year the greater part of it will come from strip mines under the new contract, instead of from the deep mines, as under the old contract. "Strip coal has been in use the last month and is proving a success," C. E. Bissell, fuel agent for the Frisco in the Kansas field, stated. The companies with whom the new contracts were signed during the week ended July 25 are the Central Coal & Coke Co., Crowe Coal Co., Clemens Coal Co. and Hamilton Coal Co.

George Burla and Ralph Walker suffered burns from gas while resinking an old shaft for the Magnolia Coal Co. near Mineral on July 24 and died some hours later. The lower vein of coal was worked out ten years ago and the 150-ft. shaft filled with cinders. The shaft was being reopened to the 40-ft. level to work the top vein. Sulphureted hydrogen from the old workings made its way through the cinder filling and ignited when one of the workmen struck a match to light his pipe.

The Pittsburg Midway Coal Co. has paid more than $75,000 in the last few weeks to land owners between Coffeyville and Angola and Valeda for coal rights, the payments being made as fast as the titles to the properties are approved. Options were taken some time ago.

## KENTUCKY

The Tennessee Jellico Coal Co., Louisville, has recently filed amended articles limiting its liability to $1,000,000.

The Kentucky Court of Appeals has cleared Sheriff Tolbert Holliday, of Perry County, of charges of misconduct in office and has replaced him in good standing. Governor Fields had under the ouster law held him guilty and ordered him out of office. Holliday will serve until Jan. 1, 1926, when his term expires. He had been charged with neglect of office, accepting pay from coal companies for giving them protection, and numerous other things, many of which it was alleged, were merely trumped up charges in an effort of a lawless element to get rid of the sheriff.

The Downard Mining Coal Co., which purchased a Harlan County mine a few month ago, has changed its name to the Downard Mining & Sales Co., of which J. Paul Downard is the active head. Elmore Manning, one of the original officers of the concern, sold his interest some time ago, and is now manager at Louisville for the Southern Coal Co., of Memphis.

The mines of the Eden Coal Co., near Blackey, in Letcher County, which had been down for some time, have resumed operations on a full-time basis, and with a prospect of fairly steady operation. A. S. Petrey, of Hazard, is head of the company.

The steamer Julius Fleischman, of the Hatfield-Reliance Coal Co., interests, came in from the West Virginia fields a few days ago, leaving eight barges of coal at Louisville, three to go down river.

C. D. Major, of the Byrne & Speed Coal Co., Beaver Dam Coal Co., North Jellico Coal Co. and allied Speed-Sackett coal interests of Louisville, recently won a handsome golf trophy at the Audubon Country Club.

Abner Lunsford, head of the Henry Ford coal interests stated in Cincinnati last week that the big Banner Fork mines at Kentenia, in the Hazard field, were down and would not be working for a week or ten days on account of a break in the shaft.

Denver B. Cornett, eastern Kentucky mine operator, of Harlan, is one of five men whose names have been given to Governor Fields, from which one name will be selected for appointment as member of the State Board of Election Commissioners. The names were selected by the Republican state central committee.

## MISSOURI

The city supply commissioner of St. Louis, July 29 awarded contracts for coal to be supplied the water works and various city institutions for the period Aug. 1, 1925, to July 31, 1926. The largest contract for the water department, calls for a minimum of 60,000 tons of water screenings f.o.b. Bissell's Point Pumping Station. It went to the Crerar-Clinch Coal Co. at $2.63. The Berry Bergs Coal Co. contracts to deliver 20,000 tons of screenings to the city sanitarium pumping station for $2.69 per ton and for 7,500 tons of mine-run at $3.05.

Three men lost their lives on July 21 as the result of black damp in a coal mine seven miles southeast of Unionville. They are Alzono Minear, Pearl Minear and Ted Baugher. The mine was not being worked. Baugher had gone down the shaft 22 ft. to bring out some tools when the damp struck. The two others went to his rescue and also were overcome.

## OHIO

Miners in the pits of the Pittsburgh Coal Co. at Pomeroy were paid $23,118.67 in their last pay for two weeks' work, officials of the company announced at Pittsburgh Thursday. The payroll of the Stalter-Esses Co. is understood to have amounted to about $8,000, making a total mine payroll at Pomeroy of more than $31,000. The pay of the Pittsburgh Coal Co. represents a substantial increase since it began operating three mines there. There are now 379 miners working for the company in that field.

C. J. Albasin, commissioner of the Pittsburgh Vein Operators' Association in the southern Ohio field, reports that only 40 mines are working in that district. Production totals will be much below those of previous years, he says. The same situation exists in the Wheeling district.

On what probably will be the last artificial wave used for wafting heavy shipping down the Ohio River until the completion of the lock and dam system that will assure a 9-ft. stage, more than 30,000 tons of coal arrived at Cincinnati July 30. The coal was consigned from the Kanawha River and Huntington, West Virginia, to the Island Creek, Campbell Creek, Philadelphia & Cleveland and Hatfield-Reliance coal companies.

The Lake Erie Fuel Corp., of Buffalo, has opened a branch office in Cleveland in charge of George C. Schwehr, who is president of the Cleveland Wholesale Coal Association, but was formerly a Buffalo coal man.

## OKLAHOMA

The union coal miners made their most pretentious demonstration July 26 against operators who refuse to pay the 1924 wage scale. Speeches were made by national and district union officials. Several hundred cars carrying miners paraded at Okmulgee, the county seat, and in Henryetta the streets were filled with cars throughout the day. The union miners had challenged the operators to debate the coal situation at a meeting July 26. Sunday morning the Henryetta District Coal Operators' Association published a statement declining to accept, saying that their mines were operating on the 1917 scale and that the local miners could go to work at it if they so desired and if they did not other miners would be brought in from the outside. Col. E. Head, 180th Infantry, Oklahoma National Guard, commanding the troops at Henryetta, refused to answer when asked if he had called for additional troops, but more soldiers were noted during the meeting July 26.

**Where Drop-Bottom Cars Are Discharged Automatically**

Steel tipple of Stearns Co-Operative Coal Co., a subsidiary of the Stearns Coal & Lumber Co., at Co-Operative, Ky. A light and airy structure. In the dumping of drop-bottom cars a minimum of shock is sustained by the tipple.

Five mines in the Henryetta field which are being operated under open-shop rules produced 7,900 tons of coal in the week ended July 18, according to J. O. Johnson, assistant commissioner of the Southwestern Interstate Coal Operators Association. Six mines were running open shop last week. A tonnage of 1,600 is the weekly output of five other mines, four of which are run co-operatively and the fifth under contract, Johnson said. Picketing of the mines has been peaceful and for the most part has been carried on by women and children, who hold meetings outside the mines, sing songs, offer prayers and endeavor to persuade non-union miners to join the union ranks, it is said.

## PENNSYLVANIA

The union mines of the Pittsburgh district are now operating at 8.3 per cent of capacity, according to the reports to the Pittsburgh Coal Producers' Association for the week ended July 25. With a weekly capacity of 629,880 tons the 14 working mines out of 80 produced during that week 52,204 tons. The operations compare with 7.7 per cent in the previous week, but with 28 per cent last year at this time.

Approximately 4,500 acres of coal land in the Snow Shoe region near Bellefonte, with six miles of railroad, half a dozen houses, two steam shovels and all modern equipment for stripping operations, will be sold at receivers' sale on Aug. 27 by R. P. McClellan, A. R. McNitt and T. B. Bridgons, receivers for the Blanchard-Moshannon Coal Co. Stripping operations were begun by the company two years ago under the presidency of William G. Blanchard, of Pittsburgh.

The Jefferson-Indiana Coal Co., which is operating several of the mines of the Rochester & Pittsburgh Coal & Iron Co., produced 8,800 tons of coal one day last week, thus breaking the record at one or two of the mines. Work is on a reduced-wage scale. There is no disturbance.

Governor Pinchot has reappointed S. J. Phillips, of Scranton, as an anthracite mine inspector.

The Indian Creek drainage case is expected to be finally disposed of on Aug. 10, when a hearing will be held at Uniontown before Judge Van Sweringen. At this hearing a plan will be submitted whereby the coal companies of the Indian Creek Valley may construct a drainage tunnel for sufficient distance to avoid pollution of the stream from which two public service companies draw their water supplies. Both parties to the long-fought dispute are ready to agree to a settlement this way, if possible, it is understood, and the coal companies joined in the petition to the court for the hearing date. The case attracted wide attention for a long period due to the vigorous complaint of the Pennsylvania R.R.

## UTAH

J. R. Flemming has been awarded the lease of 1,800 acres of coking coal land in the Sunnyside district of Emery County. The conditions are that the government receive a royalty of 12½c. per ton. The sum of $75,000 must be expended in developing the property within three years and a minimum annual production of 50,000 tons beginning in the fourth year is required.

## VIRGINIA

The Clinchfield Coal Corp. reports net earnings of $2,000,853 for the first half of 1925, against $2,170,921 in the same period in 1924. After all deductions the company reported a net income of $241,615, against $336,474 last year. After preferred dividends and sinking-fund requirements the company reported a surplus of $177,323 for the half year, against $274,557 last year.

The Big Sandy & Cumberland R.R., a narrow-gage subsidiary line of the Norfolk & Western Ry., running from Devon, W. Va., to Grundy, Va., 33 miles, has applied to the Interstate Commerce Commission for authority to build an extension of 14 miles near Hurley, in Buchanan County, Virginia, along Home Creek and the Lester Fork of Knox Creek. This is to shorten the line and reduce grades. It also will connect two lines. The route is in a coal and timber region.

### WEST VIRGINIA

Coal operators in northern West Virginia are expected to receive telegrams this week to report to New York City for final conference on the much-discussed $100,000,000 merger. There are twenty companies involved and it is reported that this is a showdown on the proposition.

The Brady-Warner Coal Co. resumed operations on July 23 at the Abrams Creek mines at Oakmont on the Elk Garden branch of the Western Maryland, with about 45 men reporting for work the first day; but it is stated by E. Richard Brydon, who is in charge of the mine that when it is in full operation the mine will use about 100 men and will be able to produce from 500 to 600 tons. The Abrams Creek mines have been idle since January 1. A large amount of money has been expended by the company in modernizing the mines.

The Consolidation Coal Co. has ordered a steel headframe for its new plant, No. 261, at Juno, McDowell County. The company has been developing this mine for several years, and at present is producing a large tonnage.

The Bethlehem Mines Corporation is planning the installation of a water system at Barrackville. The water will be filtered for use by the miners of the village and for use in boilers at the mine.

In an address before the Lions Club of Morgantown, R. M. Lambie, chief of the West Virginia Department of Mines declared that wherever rock dusting has been employed and explosions have occurred the destruction of life and property has been reduced to a minimum—in fact, according to Mr. Lambie, the velocity of the explosion has spent itself within a short distance when it struck the section of the mine where pulverized limestone had been used. The chief of the West Virginia Department of Mines declares that $6,000 a year will adequately dust any mine in West Virginia. He believes this to be "a sum infinitely small in comparison to the added protection it gives lives and property."

T. C. Songer, of Ashland, Ky., general chairman of the Brotherhood of Locomotive Engineers for the Chesapeake & Ohio Ry., was elected chairman of the board of directors of the Coal River Collieries Co. at a special meeting at Huntington, July 21. G. C. Hoffman, of Cleveland, assistant treasurer of the company, was elected to the directorate to fill the vacancy caused by the recent death of Warren S. Stone. The latter was chairman of the board.

The following companies have filed certificates of dissolution with the Secretary of State: The Harry B. Coal & Coke Co., Dixie Mining Co., Big Four Coal Co., Car-Diff Smokeless Coal Co., Beall Knob Coal Co., Marshall Fuel Corporation, Twin States Fuel Co., Junior Coal Co., Robinson Run Fuel Co., Begley Coal Co., W. H. Green Coal Co., Piney Creek Coal Co., Masontown Coal Co., Spring Mountain Mining Co., Troll Coal Co., Steamwell Coal Co. and Penn Marva Coal Co. Certificates of withdrawal have been filed by the Fort Dearborn Coal Co. and the Low Moor Iron Co., of Virginia.

### CANADA

Premier E. N. Rhodes of Nova Scotia and the members of the new government were in conference at Halifax on July 27 in connection with the Cape Breton coal strike. No announcement was given out as to the result of their deliberations. The conferences between the government, the representatives of the British Empire Steel Corporation and the District Board of the U. M. W. were to be resumed on the 30th. Further acts of vandalism have occurred in the strike area including incendiary fires at Glace Bay and Reserve, the looting of John R. Blue's store at New Aberdeen, and minor depredations. A warrant has been issued for the arrest of Joseph MacLeod, British Empire Steel Corporation policeman, on a charge of murder for the shooting of William Davis, in the New Waterford riot of June 11.

The Rosedale Mine, at Drumheller, Alta., resumed work July 25 with the men working under a United Mine Workers charter. There were twenty-five miners at work there, according to mine officials. District President Sherman, of the U. M. A., went to Rosedale on June 24 under police protection, and says he had a very encouraging meeting there, all present voting for a return to the United Mine Workers fold and accepting their agreement with the operators.

The British Columbia Court of Appeal is soon to decide upon the constitutionality of the tax on fuel oil imposed by the Provincial Legislature ostensibly for revenue purposes but actually with a view to protecting the coal-mining industry of Vancouver Island in particular and the province in general. Many consumers have refused to pay the tax. When the tax was imposed the Canadian National Rys., the Canadian Pacific Railway Co., the Union Steamship Co. of British Columbia and the Powell River Co., all large consumers of fuel oil, appealed to the Governor-General-in-Council against the tax, contending that the tax was indirect and could be levied only by the federal government and was within only the federal jurisdiction because it really was a custom or excise duty. The Canadian Privy Council, on the advice of the Department of Justice, declined to rule on this protest, and recommended that it be referred to the courts.

## Traffic

### Rehearing Begun on Illinois Intrastate Rates

Assistant Commissioner George W. Pillow, of Marion, Ill., representing the Illinois Commerce Commission, sitting in the East St. Louis (Ill.) City Court July 28 and 29, took testimony in the remanded fight of southern Illinois coal mines operating in what is known as the "Inner Group" to force a reduction in the present intrastate freight rate of 91c. per ton.

The Illinois Supreme Court recently overruled the St. Clair County Circuit Court, which had sustained the Illinois Commerce Commission in reducing the rates to 70c. a ton and remanded the case for further hearing.

The complainants allege that the present rate is excessive. The Alton & Southern R.R. was the technical defendant in the case heard by Pillow, but all other lines serving the Inner Group mines will be affected.

The East Side Manufacturers Association and the Illinois Coal Traffic Bureau have joined the fight for lower freight rates on coal and their cases will be heard by Pillow.

### Hearing on Ohio Coke Rates

The Coal, Coke and Iron Ore Committee, Central Freight Association Territory, announces that a hearing will be given in Room 606, Chamber of Commerce Building, Pittsburgh, Pa., Thursday, Aug. 13, 1925, at 10 a.m., daylight saving time, on the following proposed change in the rate on coke, coke breeze, coke dust and coke screenings (the direct products of coal), carloads, from South Lorain, Ohio, to Cleveland, Ohio: Rate to be made $1.26 per net ton to bring it into proper relation with rates via other routes and with rates from other districts.

Henry Pfening, Jr., superintendent of the Southeast Coal Co., and the Business Men's Club at Whitesburg, Ky., have filed petition with the Louisville & Nashville R.R. asking lower general commodity freight rates between Ravenna, Ky., and McRoberts, on the Eastern Kentucky division, holding that rates for years have been unduly high and out of line. The various towns affected, as well as Hazard, Ky., have joined in the protest.

Traffic Manager A. R. Yarborough of the Kanawha Operators Association has passed on to members of his association advices from F. M. Whittaker, vice-president in charge of traffic of the Chesapeake & Ohio Ry., that mine cards will be marked with a clause, where desired, to the effect that coal shall not be delivered until payment is made of freight and all other lawful charges.

## Recent Patents

**Mining Machine**; 1,536,131. Thomas E. Pray, Chicago, Ill., assignor to Goodman Manufacturing Co., Chicago, Ill. May 5, 1925. Filed Aug. 4, 1921; serial No. 489,793.

**Concentrator and Flotation Separator**; 1,536,236. William R. Morris, Boise, Idaho, assignor to Mineral Development Co., Boise, Idaho. May 5, 1925. Filed Feb. 23, 1922; serial No. 538,723.

**Mining Machine**; 1,536,327. Frank Cartlidge, Cincinnati, Ohio, assignor to Sullivan Machinery Co., Chicago, Ill., May 5, 1925. Original application filed June 12, 1915; serial No. 487,724. Divided and this application filed June 25, 1924; serial No. 722,373.

**Skip-Hoist and Tram-Car Operating Means**; 1,536,432. Wm. E. Hale, Fort Washington, Pa., assignor to R. H. Beaumont Co., Philadelphia, Pa. May 5, 1925. Filed March 4, 1924; serial No. 696,778.

**Draft Device for Mining Machines**; 1,536,795. Charles E. Davis, Chicago, Ill., assignor to Goodman Mfg. Co., Chicago, Ill. May 5, 1925. Filed May 6, 1920; serial No. 379,237.

**Safety Fuse**; 1,537,296. A. F. Gearhart, MacDunn, W. Va. May 12, 1925. Filed May 5, 1922; serial No. 558,816.

**Coal Separator**; 1,537,947. E. P. Humphrey, Upper Lehigh, Pa. May 19, 1925. Filed Feb. 26, 1924; serial No. 695,240.

## Trade Literature

**Ash and Soot Disposal at the Milwaukee Sewerage Plant.** Conveyors Corporation of America, Chicago, Ill. Pp. 16; 8½ x 10¾ in.; illustrated.

**Waugh Turbo Stoper, Model 39.** The Denver Rock Drill Mfg. Co., Denver, Colo. Bulletin No. 100A. Pp. 11; 6 x 9 in.; illustrated. Describes design and construction.

General Electric Co., Schenectady, N. Y., has issued a 120-page book, No. 87000-E. covering the installation, operation and maintenance of **Switchboards.** The book measures 8 x 10½ in. and is well illustrated with photographs, diagrams, tables, formulas, etc.

**Ace Steam Trap.** W. B. Connor, Inc., New York City, N. Y. Catalog A. Pp. 10; 6 x 9 in.; illustrated. Describes in detail design, construction and operation.

The Osgood Co., Marion, Ohio, recently issued Bulletin 256, a four-page folder illustrating and describing its **¾-Yd. Power Shovel** and its combinations.

Link-Belt Co., Chicago, Ill., recently issued an 8-page booklet describing and illustrating the operation and use of the **Gondola Car Dumper.**

Vulcan Iron Works, Wilkes-Barre, Pa., builders of locomotives, have just issued an 8 page bulletin, No. 102, featuring 16- and 20-ton gear-driven gasoline locomotives. Complete specifications and general description of these two sizes is included as well as hauling-capacity charts. Some interesting photographs also are shown.

## Publications Received

**Tests of a Large Boiler Fired with Powdered Coal at the Lakeside Station, Milwaukee**, by Henry Kreisinger, John Blizard, C. E. Augustine and B. J. Cross. Bureau of Mines, Department of the Interior, Washington, D. C. Bulletin 237. Pp. 77; 6x9 in.; illustrated.

**Preliminary Report on Coal Stripping Possibilities in Illinois**, by Harold E. Culver. Prepared under a co-operative agreement between the Illinois State Geological Survey Division, the Engineering Station of the University of Illinois and the U. S. Bureau of Mines. Bulletin 28. Pp. 61, 6x9 in.; illustrated.

**South America's Trade**, with Particular Reference to the Share of the United States in Export and Import Trade of the Ten Republics. Foreign Commerce Department, Chamber of Commerce of the United States, Washington, D. C. Pp. 30; 6x9 in.; tables. Contains tables showing the chief commodities bought and sold by the United States and South America, the best customers and chief suppliers. Individual tables are given showing United States trade with each republic. The figures used in general are for 1923.

**Chemistry of Engineering Materials**, by Robert B. Leighou. McGraw-Hill Book Co., Inc., New York City. Second edition. Price, $4. Pp. 538; 5½x8 in.; illustrated. Chapters dealing with fuels, iron and steel corrosion, non-ferrous metals and non-ferrous alloys have been almost entirely rewritten and new material added.

**Market Analysis — Its Principles and Methods**, by Percival White. McGraw-Hill Book Co., Inc., New York City. Second edition. Price, $4. Pp. 438; 5½x8 in.; illustrated. A thorough revision of this pioneer book on market analysis, presenting new chapters on organizations for market research, agency market research, industrial and community surveys and newspaper surveys.

## Association Activities

At the annual meeting of the **Operators of the Williamson Field**, held during the third week of July, Thomas J. Devenny was elected president; W. B. Cummins as vice-president, George Bausewine as secretary, and W. L. Leckie as treasurer. Addresses were delivered by W. J. Jenks and G. W. Harman, vice-president of the Norfolk & Western Ry.; D. E. Spangler, general superintendent of transportation of the N. & W.; H. C. Weller, general superintendent of the N. & W.; E. S. Moore, superintendent of transportation; O. W. Cox, general coal freight agent of the N. & W.; W. O. Franklin, superintendent of the Pocahontas Division; D. F. Peters, superintendent of the Sciota Division; John Stuart, chairman of the Car Allotment Commission; Norwood Davis, car distributor of the Norfolk & Western at Williamson; W. E. Keepler, secretary of the Pocahontas Operators Association; C. C. Morfit, secretary of the Tug River Operators Association; George Dungleson, in charge of the N. & W. mines, and Thomas Harmon, prominent Pikesville (Ky.) attorney. The meeting was arranged by George Bausewine, secretary of the Williamson Operators Association.

## Industrial Notes

**The T. H. Edelblute Co.**, manufacturers of rerailers and track braces, recently built a new and enlarged factory at Reynoldsville, Pa., which will be managed by N. G. Edelblute. The general sales office will be continued in the Wabash Building, Pittsburgh, Pa.

**The Strom Ball Bearing Mfg. Co.**, Chicago, has appointed Frank R. Schubert as general manager. John Dlesk succeeds Mr. Schubert as works manager, and Lorenz Peterson continues as assistant works manager in charge of production.

## New Companies

**The Eynon Coal Co.**, Pomeroy, Ohio, has been chartered with a capital of $250,000 to mine and sell coal. Henry D. Emrys, David and Daniel Eynon, Jr., and Charles Brown are the incorporators.

Papers have been filed with the Secretary of State of Ohio, chartering the **Castner Coal Co.**, with a capital of $10,000. The new concern which will be located at 118 N. 6th St., Steubenville, will mine and deal in coal. Incorporators are: Vincent A. Morelli, William V. Morelli, David H. Thomas, Lula H. Morelli and Max Turendish.

**The Industrial Lignite Co.** was incorporated in Greenville, Texas, early in July, with a capital stock of $21,000, by J. D. Middleton, G. M. Hodges and others.

Articles of incorporation of the **Spokane Carbon Coal Co.** were filed at the county auditor's office at Spokane, Wash., recently. Capital stock is $450,000. The incorporators are O. C. Moore, W. D. Codefroy and William Watson.

**The Riceville Coal Co.**, Riceville, Ky., capital $25,000, has been chartered by Frank Morgan, T. L. Cowen and Elmer E. George.

**The Carter Coal Co.**, Madisonville, Ky., has been incorporated with a capital of $30,000, by Jewell Avis, Colman L. Jones and Sherman P. Boner.

**The Blount and Meredith Coal Co.**, Cambridge, Ohio, has been chartered with an authorized capital of $10,000 to operate coal mines and deal in coal. T. A. Blount, W. T. Meredith, William J. Griffith, A. A. Vance and Dwight McVicker are the incorporators.

A Dominion charter has been granted to **Saunder-West Collieries, Ltd.**, at Calgary, Alta. The company has capital stock of $150,000 and the incorporators are: Alexander Hannah, O. H. Might, E. J. Chambers, H. G. Nolan and L. R. Souter, all of Calgary.

**The Connery Coal & Investment Co.**, 332 South Michigan Avenue, Chicago, has been incorporated for the ownership and development of coal mines and properties. The incorporators are Arthur R. Hall, Samuel M. Rinaker and M. F. Gallagher.

## Obituary

**Seth M. Thompson**, age 59, died at the Norwood Hospital, Birmingham, Ala., July 26 as a result of injuries alleged to have been sustained from a fall of rock in the mines of the Helena-Straven Coal Co., near Helena, Shelby County, Ala., where he was employed as a foreman. Mr. Thompson was an associate inspector in the State mining department for nine years, having left the service of the state May 1 last. He was widely known in mining circles where his death will cause much regret. He is survived by his widow and several children.

**Edward H. Bair**, 65 years old, of Greensburg, Pa., well known in the business life of that district died in his home there July 28. Mr. Bair founded several power companies and organized the Clare Coke Co. and the Commonwealth Coal Co. He leaves a wife and five children.

**Julius Judson Higgins**, 76, formerly a well known coal operator in Indiana fields died July 25 while riding alone in his automobile in the downtown section of Clinton, Ind. After he was stricken, his car crashed into a truck and stopped. Mr. Higgins was born near Dayton and settled in Clinton 40 years ago. He is survived by two sons and one daughter. He was active in politics, having been state Senator. Funeral services were held in Clinton July 27 and the body was taken to Dayton, Ohio, for burial July 28.

**Duncan McKay**, one of the pioneer coal operators of the Henryetta (Okla) district, died recently at his home in that city after a short illness. Mr. McKay was a native of Aberdeen, Scotland, and came to Henryetta in 1906, engaging in the coal industry as a producer.

## Coming Meetings

**Rocky Mountain Coal Mining Institute.** Summer meeting, Aug. 26-29 at Price, Utah. Secretary, Benedict Shubart, Denver, Colo.

**American Institute of Mining and Metallurgical Engineers.** 132d meeting, at Salt Lake City, Utah, Aug. 31 to Sept. 3. Secretary, H. Foster Bain, 29 West 39th St., New York City.

**Oklahoma Coal Operators' Association.** Annual meeting, Sept. 10 at McAlester, Okla. Secretary, A. C. Casey, McAlester, Okla.

**New York State Coal Merchants' Association.** Annual convention, Sept. 10-12, at Richfield Springs, N. Y. Executive Secretary, G. W. F. Woodside, Arkay Bldg., Albany, N. Y.

**Association of Iron and Steel Electrical Engineers.** Annual meeting at Philadelphia, Pa., Sept. 14-19. Secretary, John F. Kelly, Empire Bldg., Pittsburgh, Pa.

**National Safety Council.** Annual meeting Sept. 28 to Oct. 2, at Cleveland, Ohio. Managing Director, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

**Tenth Exposition of Chemical Industries, Sept. 28 to Oct. 3, at Grand Central Palace, New York City.**

**Electric Power Club.** Fall meeting at Briarcliff Manor, N. Y., Oct. 19-22. Secretary, S. N. Clarkson, B. F. Keith Bldg., Cleveland, Ohio.

**Canadian Institute of Mining and Metallurgy.** Annual western meeting Nov. 3-5, Winnipeg, Manitoba, Can. Secretary, George C. Mackenzie, Drummond Bldg., Montreal, Que., Can.

**American Society of Mechanical Engineers.** Annual meeting at New York City, Nov. 30-Dec. 3. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

## Lewis Breaks Off Negotiations

NOTHING MORE FOOLISH and suicidal has been done by the mine workers than to break off the parley with the operators. The public is staggered to think that John Lewis and his co-workers want a strike. We will not arbitrate the matter, they said at first. Now they add: Nor will we confer with you unless you are ready to make concessions to us. If only Mr. Lewis had been able day by day to record a triumph to his anthracite supporters he would have consented to a parley, but to meet men who give way on nothing angered Mr. Lewis and he and his committee withdrew.

It has come, then, to the point that the operators are allowed to discuss wages with the United Mine Workers of America only when they are ready to make concessions. They must not discuss them in the hope of lowering scales or of continuing the present wage rates.

The session to be held with the Mine Workers is only to determine the size of the surrender and not whether there shall be any surrender at all or whether the miners shall not surrender a little to the operators. Every two years there must be a wage advance. No "backward step" must be taken. If the increase is not granted before all the mine workers' claims are presented the parley must come to end, even before the operators have been able to make their own proposals.

The public is suprised at the arrogance of the miners. It was in doubt before; it sees the condition clearly now. Those who wish a settlement without a price increase now gain encouragement, for if public sentiment sets fairly against the United Mine Workers they have no hope to gain the 30 per cent, or larger, increase which they are demanding.

## What Will Mr. Coolidge Do?

NEWSPAPERS writing from Swampscott, Mass., where the President is staying, tell us Mr. Coolidge is threatening drastic action to settle the strike of the anthracite miners should it occur, but that the President is not yet ready to use moral suasion. He desires to wait. Apparently they would infer that he is willing to let matters drift till he conceives the public is ready for drastic measures. Meantime the papers say the President is displeased with both sides because they do not quickly reach an agreement, and that he is as much vexed with the party that would arbitrate as with the party that won't, with the party that was ready to continue the conference as with the party which broke it up.

The newspapers represent Mr. Coolidge as unwilling to get into the controversy. If he hopes ultimately to compel arbitration and select the arbitrators it may be well for him to be careful about prejudging the case, but there is no reason why he should not soundly rebuke the mine workers for refusing arbitration and for breaking up the conference. There is no reason why, as the newspapers represent him, he should denounce both equally for obdurateness, knowing as he does that the public will forgive the mine worker and hear only that the operator is obdurate, whereas the latter is willing to submit to arbitration and is not at all intransigeant.

It is clear that if the President intends to take drastic action he should be willing to "break the truth" to the public as to the situation. He should not lead the people to get a prejudiced view of the case, yet he has not helped the situation one whit. He has said absolutely nothing unless he has said it to the newspapermen, and if they reported aright what he said little could be devised that would be more likely to stiffen the attitude of the mine workers.

When the time comes to take drastic measures can they be taken against the mine workers if the latter are backed by the support of the whole union interest? It will be as useless as trying to sweep back the sea with a broom. Unless the public, the union men of the country and the other wage earners are convinced that the President is right and his policy sound his action will merely make martyrs of the miners and fail to effect anything.

Consequently we fear the drastic action will be directed at the operators, who will be pliant, of course. They always are. They will sign anything; they will accept the blame for anything they will sign. No one can condemn them. The pressure of public opinion is too heavy. What are the operators among so many? America has 110,000,000 people, and the operators are only a handful.

The industry will get a body blow and then will be sick and blamed for being sick, and later be given another body blow for being sick and always whining. The rest of 110,000,000 will regret that it has to live with such an industry. Why, they will repeat, is there a perpetual problem with the anthracite industry?

Why, indeed? Solely because we temporize. Solely because we will not face the truth. We prefer to use drastic methods with the industry than to tell the facts as they are. Great Britain has temporized and must pay a subsidy. Are we so sure of our ground that we can let Mr. Lewis' challenges go unanswered?

## Mine and Other Hazards

MORE PEOPLE have been killed in New York City already this year by automobiles than are killed in the anthracite region by mine hazards in a whole year. The New York City record for automobile accidents up to July 18 totaled 501; the fatalities in anthracite mines in 1924 were 496.

If John L. Lewis would broadcast this among the people of New York City, he would effectually meet the argument he presented at the Hotel Traymore, Atlantic City, when he first met with the anthracite negotiating conference. But this he does not want to do. His address, it will be remembered, did not plead a wage inadequate for living on the American scale but proclaimed that it did not provide compensation for the perils of mining. Only Andrew Mattey with his large family spoke of the need for a higher wage scale. The consumers who thread the streets of New York among the automobiles of the metropolis without once seeing a fatality realize that, after all, only the totaling of the anthracite figures, like the marshalling of automobile accidents into statistics, could have resulted in the complex in the public mind which leads it to believe mining to be the most hazardous of industries.

This week we publish those workmen's compensation rates in Ohio that are higher than those of coal-mining. They are a surprise to almost everyone, though the facts have been known for years. Only the industrious publication of the facts as to the coal industry and the complete suppression of the facts regarding the construction industry have made people believe the coal mines have the leading fatality rate. After all, coal mining is dangerous, largely because it is from first to last a construction and not an established industry. It is always extending its operations. It is constantly erecting and demolishing its environing walls. It is always blasting ground. No wonder its record is but little better than that of the industry which it so greatly resembles. It probably would be worse if it were not better organized and controlled for safety by its operating forces.

## The Day of the Coal-Mining Curriculum

MINING education has had a period of inflation and just now is experiencing a definite shrinkage. It is necessary to analyze the causes for this condition in order to see where coal-mining education should stand.

In 1921-22 according to the U. S. Bureau of Education there were 2,895 four-year mining and metallurgical students in 121 schools of engineering. Probably the impetus given the metal-mining industry during the war accounted for this. The men who entered college in 1918 either left college before 1921 or were completing their graduating studies in 1921-1922.

In 1918 the metal-mining industries were doing well. In the years immediately following the public still had faith that the metal industries would revive. In fact after the war was over the mines continued for a time at full blast. The metal-mining industry had just received a large increase in capital provided by the banks and as a result of this industrial control, technical training was at a premium, making a college education attractive. Metallurgy had been becoming increasingly technical and, therefore, inviting to college men.

Young men who were seeking a career were some time realizing that the metal-mining and metallurgical industries could not continue to absorb the large number of men graduating. But it was evident in succeeding years that the incentive to graduation in metal mining and metallurgy had declined, for in the next year there were only 2,661 mining and metallurgical students, in 1923-24 1,898 and in 1924-25 only 1,563.

A large number of students in recent years have been seeking instruction in petroleum engineering. The petroleum industry is another occupation that has had large increases in capital with rapid progress in technique. That has made college education necessary and profitable. The rule-of-thumb methods have passed away rapidly. The development of the industry has passed forever from the control of a class of men who believed that all that was necessary was to be able to run N 45 E lines with a compass, to be able to handle a peach limb and to be competent to bulldoze drillers, teamsters and property holders. We scarcely know the industry to be the same as in earlier years now that the college-trained petroleum engineer has recreated it.

It would appear that coal-mining is going through a similar transition. Capital is coming in. Technical advice is being sought and appreciated. The rule-of-thumb method and the day of "I think" or "I guess" is being relegated to the past, and there should be a good prospect for the coal-mining engineer.

The operator who rose from a mule driver or a miner, may not appreciate science. Some do, but most do not. But the industry is getting to be in charge of college-trained capitalists. They may not be trained as engineers, but they think in terms of scholarship, and they demand that college men direct operations. Equipment that can only be handled by trained men is being introduced. Consequently we can look for college men to be in the ascendent as they are in metal mines.

At one property and not a really large one with, perhaps, six mines are 32 college men. This property is operated by a metal-mine company. It is being run like a metal mine. This is significant of the future. What we wish to know is whether the young coal-mine men will recognize the change and fit themselves for the new conditions or shall we transfer men from the metal mines, who are available to execute plans which coal men have not education enough to put into actual practice?

The anthracite industry long well capitalized by banking concerns and long operated on a relatively high technical basis has a large number of college men in its personnel. The chance for the man without college training is not good in most companies. Those who have risen from the ranks without technical education, surround themselves with men who have such training and admit that had they entered the industry a few years later the ladder by which they climbed would have been far too short to have reached up to the positions they have attained.

Each year a few of those rungs are removed and in a few years even the foremen may find that only the ladder of technical education will reach up and beyond that occupational level. Even today there are foremen who are felt to be hindrances to progress. As they die off their places will, in many cases, be filled by college men, who will be more receptive to modern ideas and better equipped to make such ideas operate successfully.

The day of the coal-mining curriculum is at hand. He will not be a wise young man who will fail to recognize that fact. We are saying of college education what has been said and truly said for many years of a lower standard of education—the mining institute and the summer courses in coal mining.

# Susquehanna Collieries Co. Is Rapidly Modernizing Its Properties and Making Savings

## Redesigned Equipments Make Possible Most of Electrifications Economies — Unsalable Sizes of Coal Generate Power Cheaper than It Can Be Bought

**By Edgar J. Gealy**
Associate Editor of *Coal Age*
New York City

WITHIN the last eight years few if any anthracite companies have made more rapid progress toward complete electrification and modernization of their mines than the Susquehanna Collieries Co., of Wilkes-Barre, Pa., a subsidiary of the M. A. Hanna Co. Ever since 1917, when the property was taken over by the present interests, both the officials of the parent company, at Cleveland, and the mining company officers have been exerting every effort to modernize its operations. Today it has surpassed its big brother producers in many respects and is therefore prepared to compete successfully in the battle against increased mining costs, substitute fuels and other economic problems.

What is perhaps more significant, however, is the fact that the company is accomplishing many of those things which other mining companies have persuaded themselves could not be done.

Today the company is burning for its own use slush—finer coal than the smallest now being sold—thus being able to send to market thousands of tons of small size fuel formerly burned at the mines. The company is generating electrical energy from pulverized anthracite at a cost much lower than that at which it can be purchased, even after charging liberal interest and depreciation rates against its own plant.

Changes to the mining equipment are being made with no delay to the production of coal. Old steam-driven hoists and fans are still being converted to electric drives without the necessity of installing new hoist or fan units or erecting new buildings. In short, the company is obtaining most of the direct savings and other benefits of electrification and modernization without the large expense involved in making complete new installations.

To the critical eye of an outsider it is true that some of the company's properties do not appear to be models of perfection; however, when it is considered that, ofttimes at many mines, the urgency for an improvement due to losses sustained by old machinery makes prompt corrective measures necessary, there is apparent a good economic reason which justifies outward appearances. If a steam-driven mine fan must be changed to electric drive on a Sunday or some other holiday, or power losses under old methods are too great to be allowed to continue, then there is plenty of reason for not waiting to construct a handsome building. Besides, when a certain amount of money is available for modernization sometimes it is best to spend it for the greatest result-getting, savings-making changes. Appearances may be improved later.

At the power plants of the company important pioneering work has been done. The power plant at Lytle was the first to use pulverized anthracite, and the success attained with fuel in this form at this plant and also at the power house near Lykens may revolutionize power generation from anthracite and prompt many other coal companies to make savings in their power bills in the same manner.

The company is divided into five major divisions, each of which is independent of the others in so far as its source of power is concerned. The Wyoming district, near Wilkes-Barre, is supplied with power from the coal company's electric plant at Nanticoke. The Shamokin power house supplies electrical energy to mines in its district. The pulverized-fuel plant at Lytle furnishes energy for the Lytle Coal Co., operated under the same management. The Lykens pulverized-fuel plant, at Short Mountain, supplies electrical energy to the Lykens district. The power requirements in the William Penn district are taken care of locally. The electric generating capacity at the four main power stations is shown in Table I.

From this table it is apparent that the power system

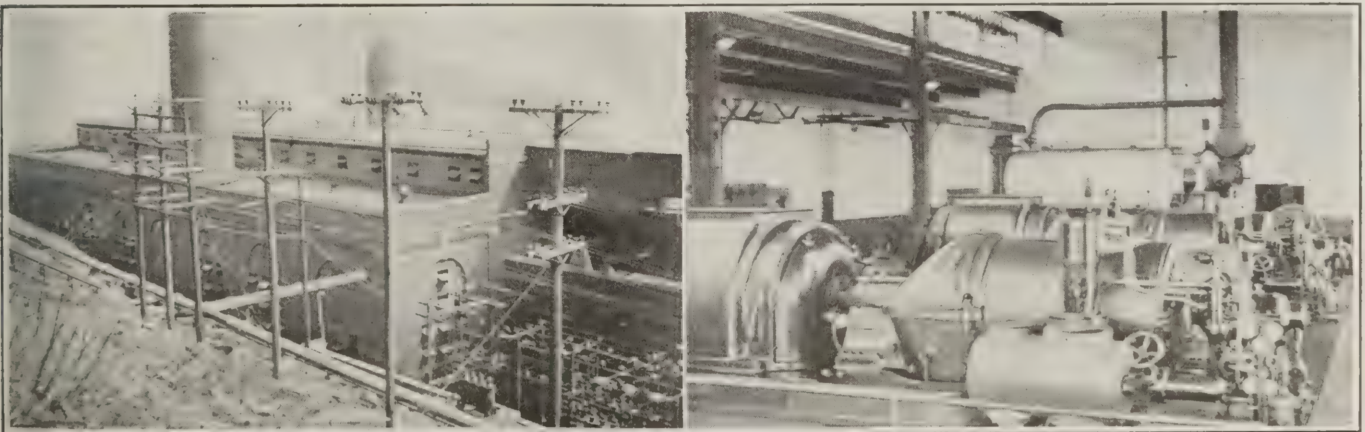

**Fig. 1—Lykens Plant and Turbo-Generators. Here Large Scale Pioneering with Pulverized Anthracite Is Going On**

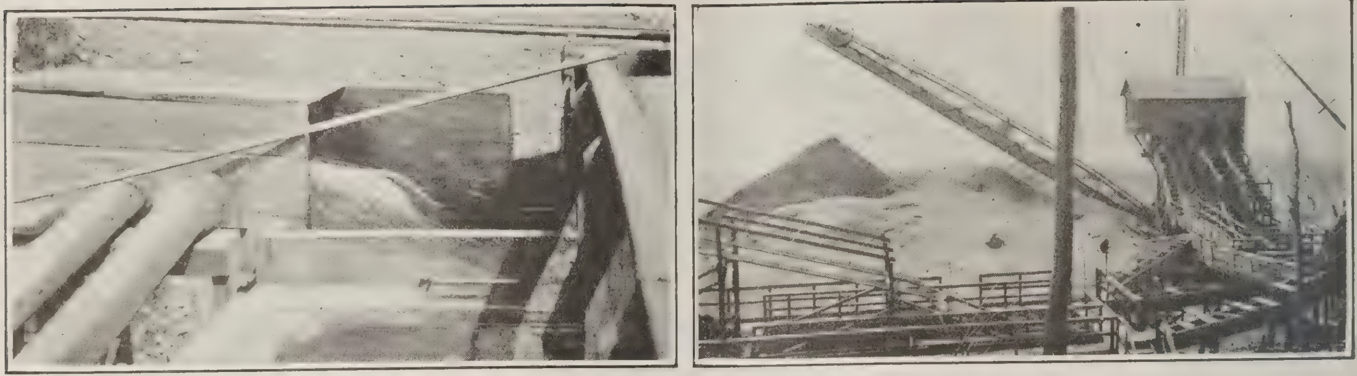

Fig. 2—Liquid Anthracite and Storage Boom Near Power House Keep Busy During Working and Idle Periods

At the Lykens power plant, V. V. Secor, the plant superintendent, calls the fluid coming out of the pipe shown on the left "liquid anthracite." All the fuel used for generating steam is transported to the power house by pumps. The coal is so fine that it can be pumped with the wash water used in the breaker and washery. On the right is shown one of the storage booms.

Table I—Capacity of Main Power Plants

| Location | Size of Units | Total Capacity |
|---|---|---|
| Nanticoke | 2—4,000 kva. | 8,000 kva. |
| Shamokin | 2—3,750 kva.* | 7,500 kva. |
| Lytle | 2— 625 kva.<br>1— 937 kva. | 2,187 kva. |
| Lykens | 2—4,000 kva. | 8,000 kva. |
| Grand total | | 25,687 kva. |

* At present there is boiler capacity here for one unit only.

of the company is greater than that of some of the largest mining companies in the anthracite region. Table II shows the total amount of energy generated at these plants during 1924.

Table II—Energy Generated in 1924

| Location | Kw.-Hr. | Location | Kw.-Hr. |
|---|---|---|---|
| Nanticoke | 19,494,580 | Lytle | 5,992,145 |
| Shamokin | 22,878,000 | Lykens | 32,548,280 |

At the Shamokin power house, in addition to the energy generated there, 13,350,558 kw.-hr. of electrical energy was purchased last year. It is interesting to note that with this arrangement, the coal company's Shamokin generating unit had a yearly load factor of 88.5 per cent.

That it is possible to obtain high machine-load factors on anthracite mine electric equipment also is illustrated by results in this division. The total connected load of the Shamokin district is 16,460 hp., or approximately 12,330 kw. The 24-hr. power consumption is about 120,000 kw.-hr. This indicates a 24-hr. load factor of 41 per cent or based on 8 hr. per day, a load factor of 123 per cent on a full working day.

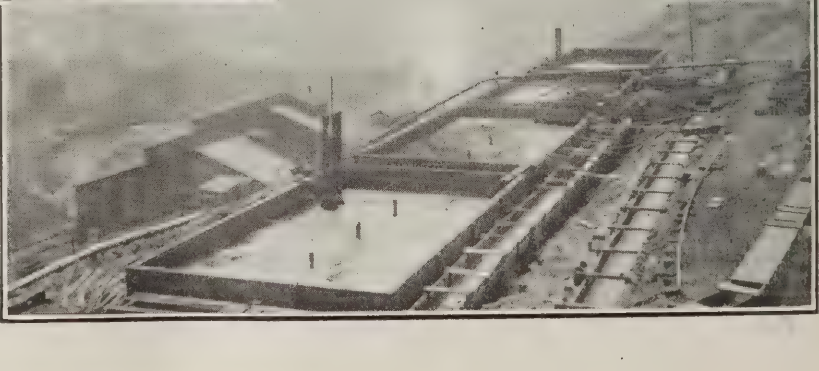
At some of the power plants a power factor of 96 per cent is attained during the day and about 90 per cent at night. This fine condition is made possible by the use of large synchronous motors on many types of drives. Most power-converting equipment consists of synchronous motor-generator sets. Air compressors are equipped with synchronous motors and many of them are of large capacity. Thus it has not been necessary to float synchronous condensers on the lines to correct poor power factor conditions.

Each of the power plants, except the Shamokin plant, has a tie connection with a nearby power company, however; this is for emergency service only and is reciprocative. For example, the contract covering the exchange of energy between the Nanticoke plant and

FIG. 3

Mountains of Fine Size Coal Await the Grinders

On the left is shown the "Black Alps." They are mountains of fine-size fuel ready to be pulverized in the mills supplying the boiler plant.



Last Traces of Fuel Are Taken Out in Settling Tanks

The water which carries the fine coal to the storage plant passes through these settling tanks before being returned to the breaker and washery. This is necessary so as to obtain good preparation for the marketable sizes.

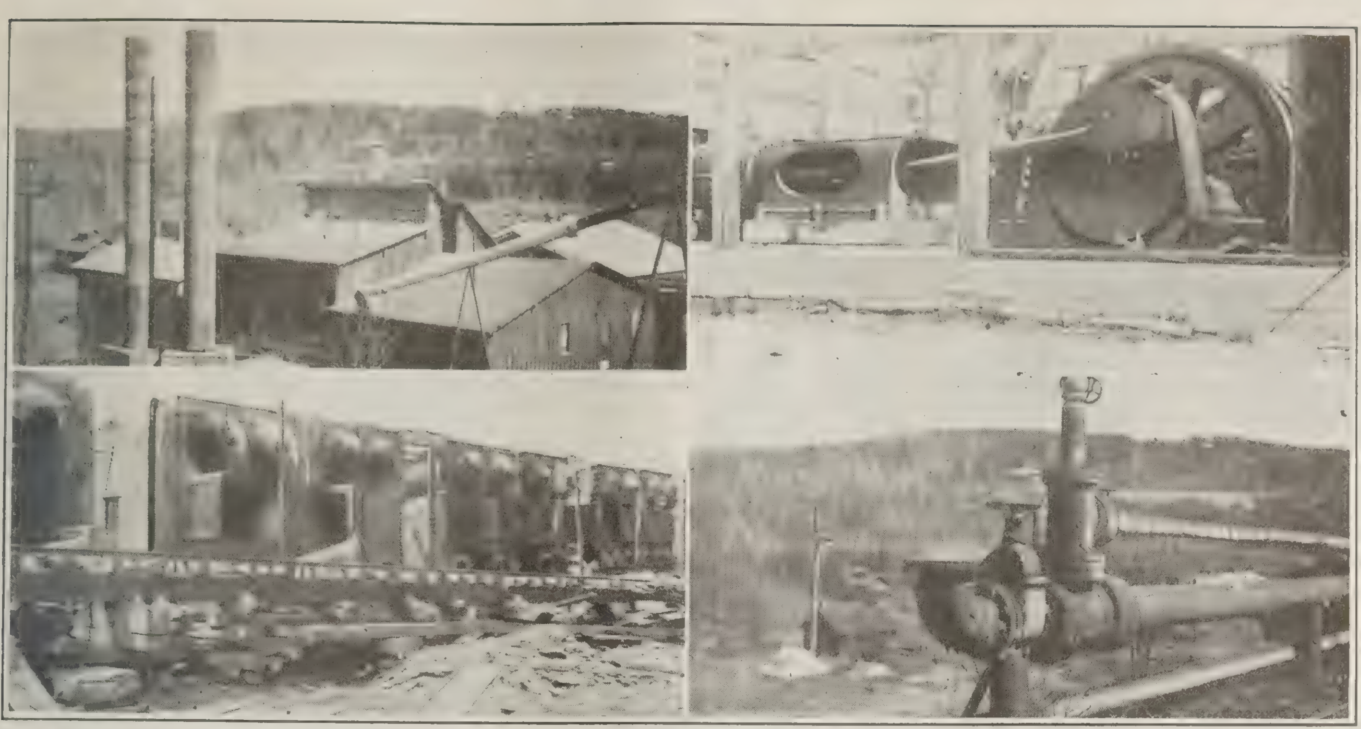


Fig. 4—The Passing Review and What Goes with It

Old fashioned inefficient steam plants, long steam lines and steam-eating engines no longer have a place in the march of progress. They are passing out in favor of modern electric power generating units and motors which use energy only when in service and transmission lines which do not try to heat the whole outside world.

the Luzerne County Gas & Electric Co. has been made purposely high so as to force each party to the contract to stand on his own legs throughout as large a part of the time as possible.

The thought of electrofying shaft hoists usually throws a scare into the minds of some engineers and company managers. The size of the present old-type steam engine, its high speed and the large building it requires make many of them grow faint when they think of the costs involved in any change.

Yet the Susquehanna Collieries Co. has electrified some of its shaft hoists at relatively low costs and is realizing large power savings thereby. The engineers determined first of all that whatever improvements were to be made on their hoists should not interfere with the steady operation of the mine. They also found that many of the hoists could be operated at slower speeds and thus use smaller motors than appeared necessary before a test was made. The possibility of obtaining higher load factors for the hoists meant much in determining the size of the motors; consequently good power factor conditions and low peaks on the power plants have resulted.

Many beneficial results usually not given due consideration when planning the electrification of a hoist also have been obtained. Slower speeds have reduced the stresses and strains on the equipment and thus maintenance costs have decreased. The rotary motion of the electric motor produces none of the vibrations common to steam engines with their rapidly changing reciprocating action. In the words of some of the shaft repair men: "You can hold the cage guides with 10-d. nails since the hoists have been electrified."

The flow of coal to the breaker also has been made more uniform with electric hoisting, which makes better preparation possible. Maintenance costs of hoisting cables have decreased. With high-speed steam engines the slippage of the rope on the sheave wheel while starting and the slippage of the wheel due to its inertia when the hoist is stopped caused excessive wear not now experienced.

The ease with which the motorized hoists are operated makes few if any of the old steam-hoist engineers, now operating electric machines, care to return to the steam-driven units. Some of the oldest engineers who have operated steam engines for more than thirty years have adapted themselves to electric hoists as easily as a duck takes to water.

By abandoning individual isolated boiler plants, which furnished steam through long, inefficient steam lines to hoists, fans and compressors, large savings have been made. All of these old engines formerly operated non-condensing and many were installed with overload capacities far in excess of any demand that ever arose.

How these installations were changed to electric drives without interfering with the operation of the

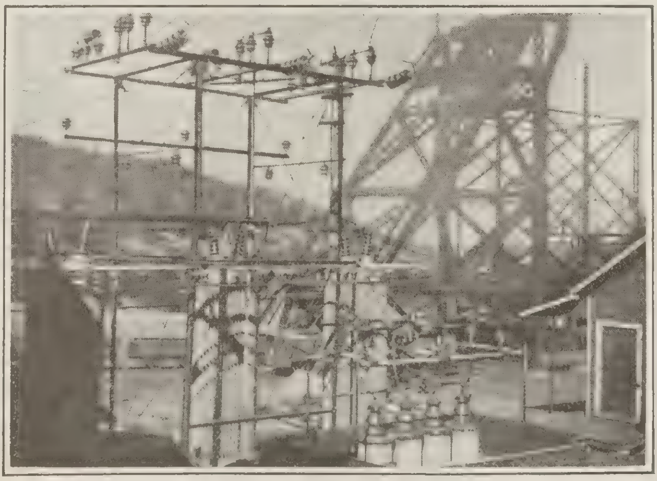

Fig. 5—Newly Constructed Substations Make Mines More Modern

At No. 7 shaft, near Glen Lyon, three 400-kva. transformers step the voltage from 22,000 to 2,200. The large-capacity substation is already proving too small for the increasing electric load.

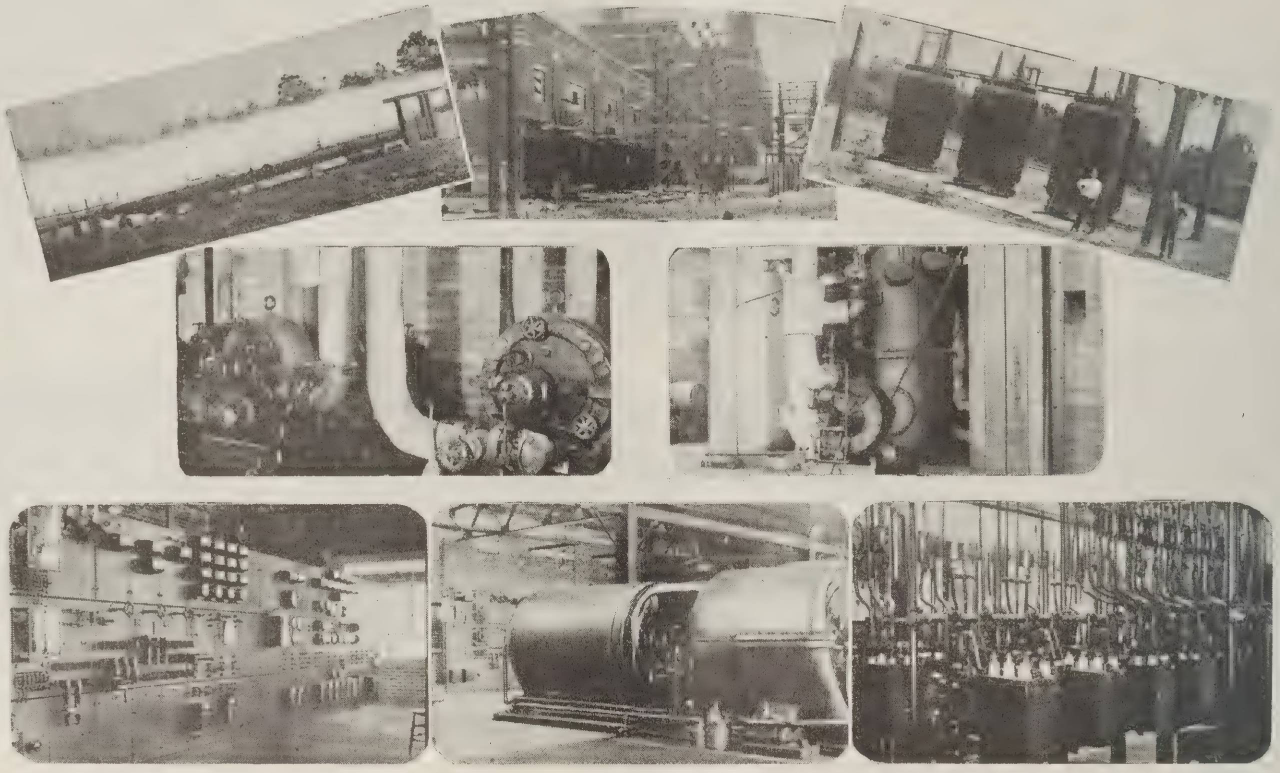

**Fig. 6—The Shamokin Power House with Its Modern and Recording Breaking Equipment. Any Power Company Would Be Justifiably Jealous of Its Load Factor**

In many respects this is one of the most wonderful power-generating plants in the coal regions. For many days and nights the turbo-generater unit operates at 100 per cent load factor. Large pumping loads come on at night when the breaker and hoist machinery ordinarily stops. Last year the plant had an all-year load factor of 88.5 per cent, including during the period every minute of the time. These pictures show how modernly it is equipped. Solenoid-operated switches operate the circuit breakers which connect to many feeders and supply lines. The plant is tied in with a public-utility company operating in this district. A spray pond cooling system is used and thus only a small quantity of water is necessary to operate this plant.

mines is most interesting. Machines designed when electric motors were almost unknown are now rejuvenated and the engineers who have done the work have used electricity. A few examples show how each installation was a problem in itself.

At Stearns No. 4 shaft the main hoisting equipment was changed from steam to electric drive. Originally the hoist was driven by a first-motion steam engine. The two steam cylinders were located as shown in Fig. 7. All the work preliminary to the change to electric drive was done while the steam hoist was in daily operation.

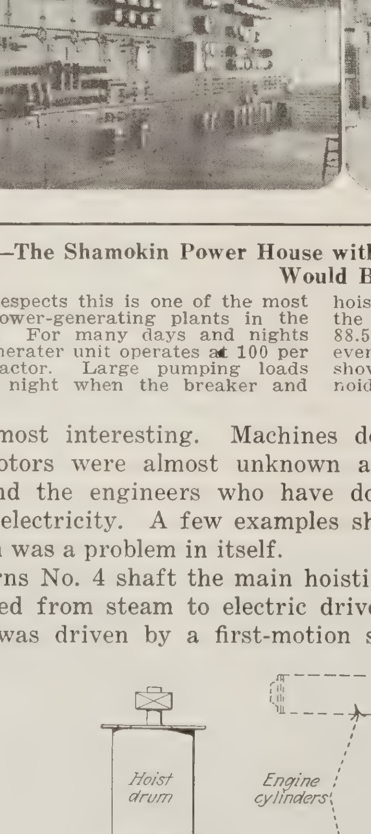

**Fig. 7—An Old Steam Hoist Electrically Operated**

Isolated boiler plants which were costly to operate were completely abandoned. This hoist, at Stearns, was equipped with herringbone gears and an electric motor.

A large solid coupling was provided for attaching the drum shaft to the reduction gears driven by the motor. These gears are of the herringbone type. The motor is a 300-hp. 2,200-volt slipring induction type unit. An automatic weighted airbrake is applied whenever power fails. In this manner the electrified hoist is made safer than with the steam drive.

Another large-size hoist was changed to electric drive at the No. 7 shaft of No. 6 Colliery, at Glen Lyon, Pa. A 400-hp. induction motor drives the hoist through herringbone gears. Connected to the high-speed shaft is a gear-type overspeed tripping device which gives all the protection obtainable by steam operation. The layout is shown in Fig. 8.

An interesting change-over was made at the fan house at Stearns. Here the former steam engine was supplanted by a 75-hp. 2,200-volt induction motor connected through an automatic starter. Whenever power is restored after a shutdown on the transmission line the automatic starter sets the motor in operation immediately without any manual operation.

Fig. 9 shows how the old steam engine frame is used to support a bearing box which carries one end of the fan shaft. Suitable speed reduction is obtained by means of a silent-chain drive running in an oil-tight casing.

No. 7 shaft fan house, near Glen Lyon, was altered

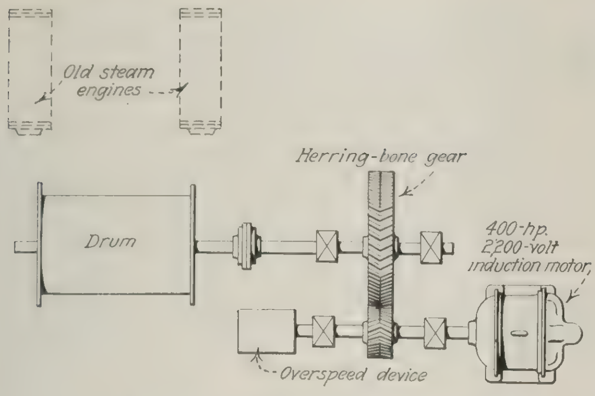

**Fig. 8—Main Shaft Hoist Rejuvenated**

The automatic speed and over-hoist control equipment supplied with the motor which now drives this old steam hoist makes a simple outfit easy and safe to operate.

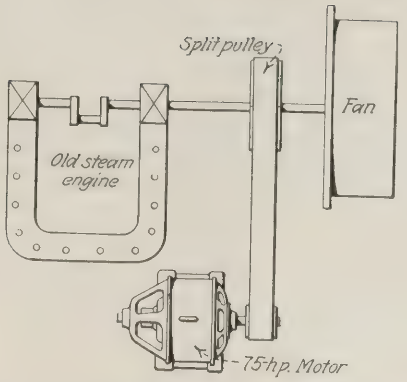

**Fig. 10—Electrified Though Little Changed**

A split pulley was mounted on the fan shaft and the change from steam to electric drive was completed without interference to coal production.

but little when an electric motor replaced the old steam drive. Practically nothing was taken out of the engine house when the change was made. As shown in Fig. 10, a split pulley was mounted on the old fan shaft and belted to a 75-hp. 2,200-volt motor. The installation looks peculiar because the steam engine remains in position, but its crank has been disconnected. The old engine bearings support the fan shaft.

The Mill Seam fan house, at Nanticoke, was driven by a cross-compound steam engine which received its steam from a separate boiler house maintained and operated for this fan only. The fuel was freighted over the Pennsylvania R.R. from the breaker, nearly half a mile away, to the fan boiler house.

When it was decided to electrify this fan, an investigation showed that only one of the two engine cylinders was required to carry the load. Thereupon one cylinder was disconnected and an alternating-current induction motor set up on the old foundation. A countershaft was then installed and everything was made ready to change from the giant oversized steam engine which had driven the fan for years. On a Fourth of July morning this work was started and completed in 12 hours, not a single moment of production being lost by the mine. The motor is a 75-hp. 2,200-volt three-phase, 60-cycle unit. Fig. 11 shows the location of the old fan engine (dotted) and the layout of the present drive.

Some idea of the extent to which electrification has been carried can be gained from what has been done at the Williamstown operation, near the town of Williamstown, in the Lykens district.

This operation consists of three parts, one including the breaker, another the Big Lick operations and the other the territory at Nos. 1 and 2 shafts in Bear Valley. Exclusive of many direct-current machines such as locomotives, etc., the total alternating-current connected load amounts to 11,313 hp. The distribution of this equipment is as shown in Table III and Fig. 12.

**Table III—Distribution of Alternating-Current Connected Load**

| Hoists | Pumps | Fans | Converting Units | Compressors | Misc. | Total | No. of Machines |
|---|---|---|---|---|---|---|---|
| | | | AT BIG LICK | | | | |
| 1,360 | 32.5 | 82 | 275 | 485 | ..... | 2,234.5 | 13 |
| | | | AT BREAKER | | | | |
| | 207.5 | .... | .... | ..... | 405.5 | 613.0 | 9 |
| | | | AT BEAR VALLEY | | | | |
| 1,240 | 4,842.5 | 225 | 870 | 1,288.1 | | 84,65.6 | 29 |
| 2,600 | 5,082.5 | 307 | 1,145 | 1,773.1 | 405.5 | 11,313 | 51 Totals |

This colliery has what is perhaps the longest outside electric locomotive haulage system in the coal fields. From the Big Lick territory coal is hauled about 2 miles along the side of a mountain to the breaker. Extending in the other direction to the No. 1 and 2 shafts territory is another long outside haulage track which extends from the breaker through a 4,000-ft. tunnel to the other side of the mountain and then about a mile to No. 1 shaft.

Incidentally, this tunnel is one of the finest in the anthracite field. It runs through the mountain from the breaker to No. 2 shaft. The grade is slightly in favor of the loaded cars. The haulway is as straight as an arrow. Very little timber is used to support the roof in the tunnel because it was driven with hand tools at a time when heavy explosive charges, which ordinarily shatter the rock, were not used. The tunnel

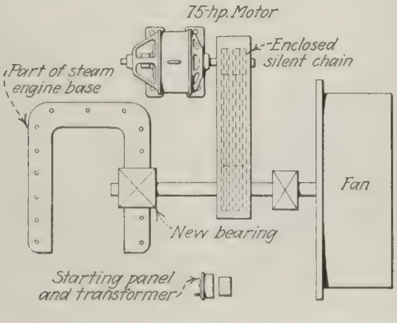

**Fig. 9—Automatic Control Replaces Steam Drive**

Not only was the inefficient steam engine supplanted by an electric motor here but an attendant was eliminated also. The fan is now driven through a silent chain and the motor is automatically controlled.

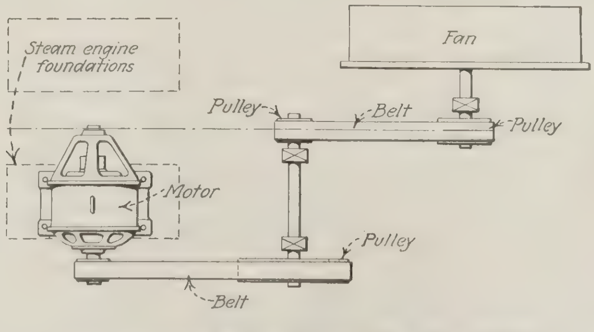

**Fig. 11—How a Fan Drive Was Remodeled**

This new arrangement was effected in 12 hours on a holiday, hence no operating time was lost by the mine. The fan house is bigger than now necessary but large savings are made as a result of this quick change.

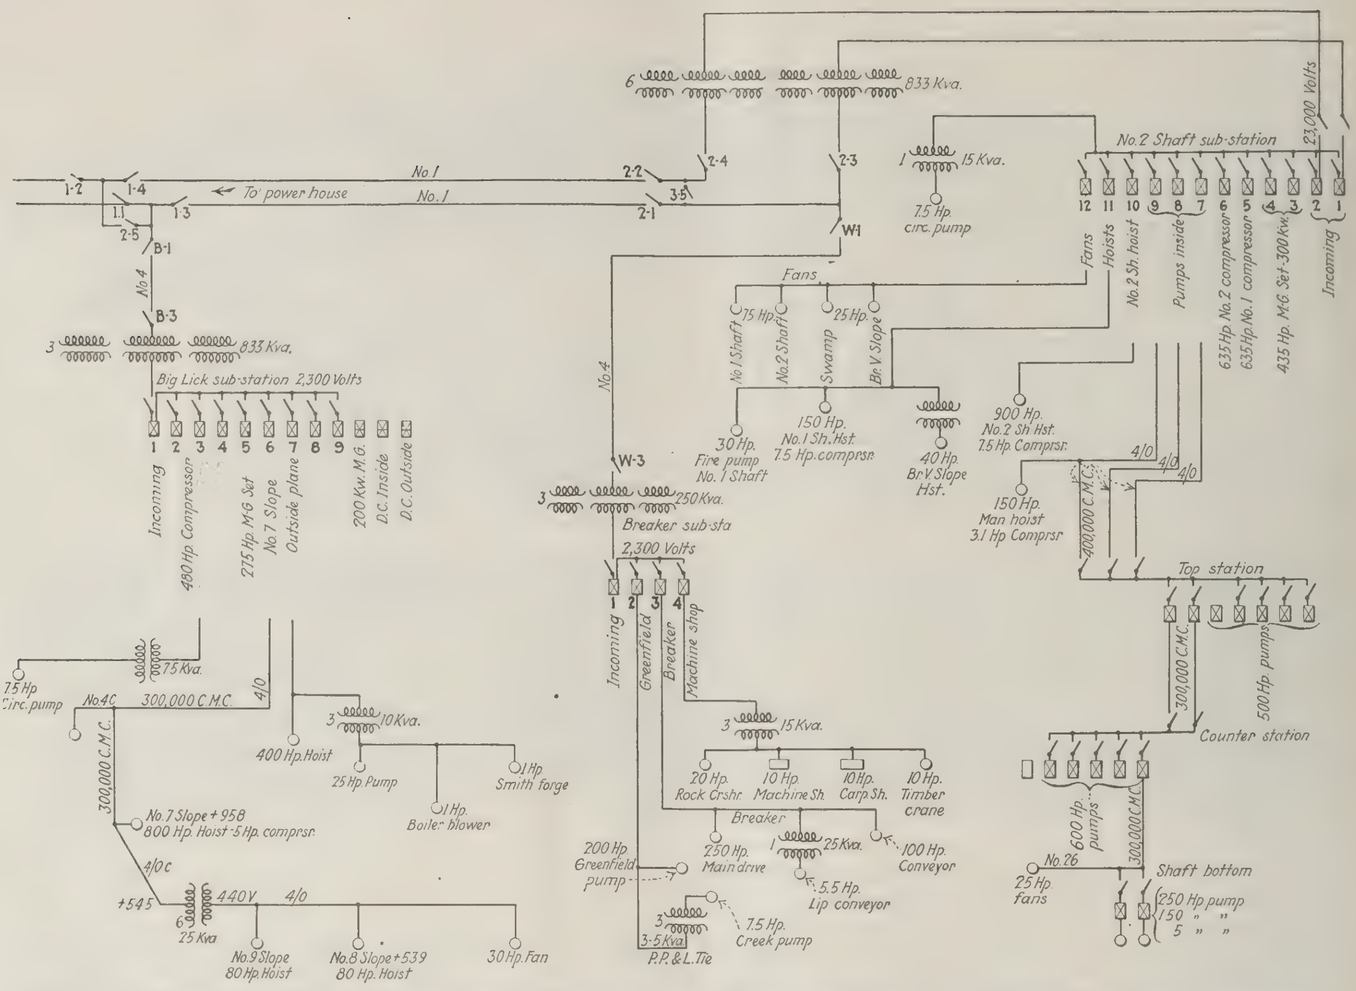

**Fig. 12—Where in the Whole Mining Field Is There a Larger Motor Load Than Here? This Mine Has a Connected Load of Alternating-Current Motors Greater Than 11,000 Hp.**

Each of the main divisions of the Williamstown Colliery is supplied with 22,000-volt electrical energy generated at the Lykens pulverized-fuel plant. The large pumping load makes possible a good all-day load factor. Most of this colliery is now electrically operated.

was started in the year 1860. It is said that many of the workmen employed on the job at that time dropped their tools and plied their trade with General Grant.

Before the coal is delivered to the locomotives at Big Lick it is raised on an outside plane by a 400-hp. electric hoist. At this same section is an 800-hp. electric hoist and a 480-hp. compressor motor, besides other important machines, as shown in Fig. 12.

All the machinery in and around the Williamstown breaker is electrically operated except an outside plane and slush pump. When the change was made from steam to electric drive at the breaker one 250-hp. three-phase 60-cycle slipring induction motor replaced the old steam engine that formerly drove the breaker machinery.

The most interesting part of the property, however, is at the No. 2 shaft, where there is an eight-compartment shaft which no doubt is the only one in existence. Four hoisting engines are used. Steam-driven hoisting engines formerly stood in the four different hoisting positions around the headframe. Four compartments were formerly used for hoisting coal and four for raising water by means of buckets. The shaft is 1,650 ft. deep.

At present this shaft is in a state of change. One steam hoist operates to the bottom level and an electric hoist works to the counter level. Water is now raised by means of pumps. An unusually large compressed-air line runs down the shaft.

The electric hoist is shown in Fig. 14. It has a 14-ft. drum and is driven by a 900-hp. induction motor at a rope speed of 1,500 ft. per minute. This hoist drum is the largest-diameter unit of its kind in the anthracite region.

The compressors supplying the high-pressure air are two 3,300-cu.ft. units which discharge into two 5x18-ft. receivers. The main air lines entering the mine consist of 400 ft. of 14-in. and 1,600 ft. of 12-in. pipe, a large receiver system in themselves.

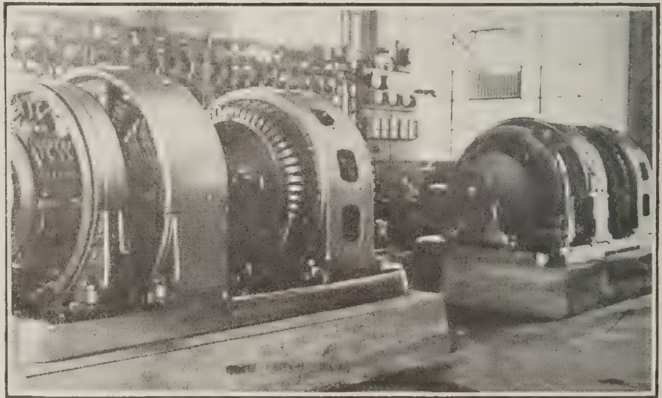

**Fig. 13—Large Motor-Generator Sets Help Maintain Good Power Factor Conditions**

These units serve the long haulage system at No. 2 shaft, near Williamstown, Pa. In the same building are two synchronous motors driving air compressors. Such apparatus prevents bad power factor loads.

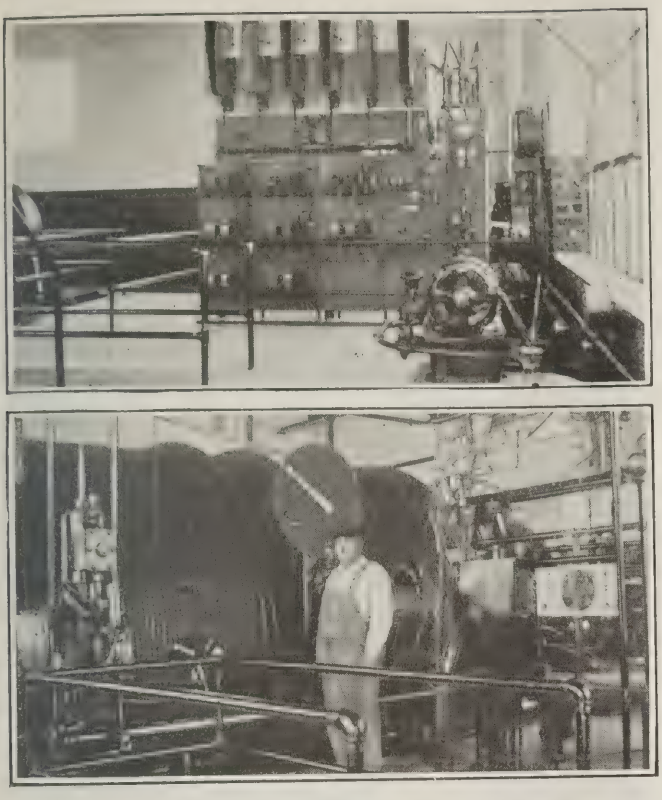

Fig. 14—Giant Hoist Which Operates Two Compartments of an 8-Section Shaft

The picture shown below illustrates the 14-ft. drum hoist and its protective equipment. Above is the 2,200-volt electric control panel and compressed air unit which operates the brakes.

The pumping equipment inside the mines at No. 2 shaft constitutes the largest group of pump units draining any one mine in the coal region. The shaft is so deep that it was considered advisable to relay the water out of the mines. Several ingenious schemes have been used to keep the cost of pumping as low as possible. All the pumps are equipped with diffusion vanes so as to cause them to operate at the highest possible efficiencies; the sumps have been arranged to permit much of the silt in the water to settle before it is pumped; no water is allowed to flow needlessly to a low level and then be pumped, and the water is raised no higher than necessary to cause it to flow out of the mines.

Two main pumps are located at the shaft bottom. These consist of a 250-hp. and a 150-hp. unit which are primed by a 5-hp. vacuum pump. At the counter level four large 600-hp. pumps raise the water collected at this level and that pumped from the shaft bottom to the so-called top station. From the top station the water is again raised by four eight-stage centrifugal pumps which lift the water to the top of the shaft, which is about 80 ft. above the tunnel level. Part of the water flows to the Williamstown breaker through the tunnel and the remainder into Bear Valley.

These are merely some of the means by which this company has been effecting savings and modernizing its properties. Quietly but rapidly it has been blazing the trail toward better mining methods. Although the company has accomplished a great deal in this direction it has completed only a small part of its program and much yet remains to be done.

# Pumping Mine Water Promptly Reduces Corrosion of Metals

### By Joseph A. Shaw*

Within recent months two scientific papers have emphasized the part played by oxygen in the acid-corrosion of metals, indicating that prompt pumping of mine water reduces corrosion of metals exposed to this water. Whitman and Russell[1] found that mild steel was corroded in an oxygen-saturated dilute sulphuric acid solution more than eleven times as fast as in the absence of oxygen; and copper, tin and nickel were corroded in an enormously higher ratio. Hall and Teague[2] obtained results on mine water that in general are in complete accord with those of Whitman and Russell on pure sulphuric acid.

Hall and Teague find that ferric salts act in much the same manner as free oxygen, at least they increase corrosion materially.[3] To quote from page 9, "In acid mine waters, on the other hand the rate of depolarization is no longer dependent solely upon the concentration of dissolved oxygen; in most waters of this type, in fact, the concentration of ferric iron is the dominant element in the oxidation at metallic surfaces, and the rate of corrosion becomes a direct function of such concentration." And on page 57 in speaking of tin, Hall and Teague say that as in the case of copper, increasing the acidity has little effect so long as the oxygen concentration is not increased materially, but that when it is increased by ferric iron, the rate of corrosion is enormously increased.

In other words, as Dr. Hall has expressed it, a container full of mine water is a storage battery which becomes charged by remaining in contact with the air instead of having to be put in electrical contact with a generator. When a piece of metal is placed in oxidized mine water, differences of potential are set up and the storage battery discharges with disastrous effects to the metal. These effects are similar to the action on the anode metal of an electro plating cell, though in this case the conditions are not right for the deposition of the metal as such at the opposite electrode.

The longer the mine water is exposed to the air the higher becomes the concentration of these oxidized iron salts and the higher becomes its corroding potential, for, of course, it is the concentration of oxidized iron salts rather than the total quantity present that affects the corrosion rate.

Therefore, any system of handling mine water as quickly as possible after it gets into the mine should be subject to smaller corrosion losses than a system that allows the water to collect and pumps it out only at such times as are absolutely necessary for the working of the mine.

It is realized that in many instances engineering objections will necessarily overrule the adoption of any change in the pumping system. But it is also believed that in many instances a little consideration of this matter will save considerable annoyance and expense from corrosion.

[3] High chrome steels are an exception to this well nigh general weakness to an oxidizing attack, but their cost, of course, limits their usefulness.

# Semi-Portable Dump Solves Refuse Disposal Problem

### Electrically-Operated Device for Handling Rock Can Be Slid Along Track, thus Making Side Discharge of Cars Possible

**By J. H. Edwards**
Associate Editor of *Coal Age*,
Huntington, W. Va.

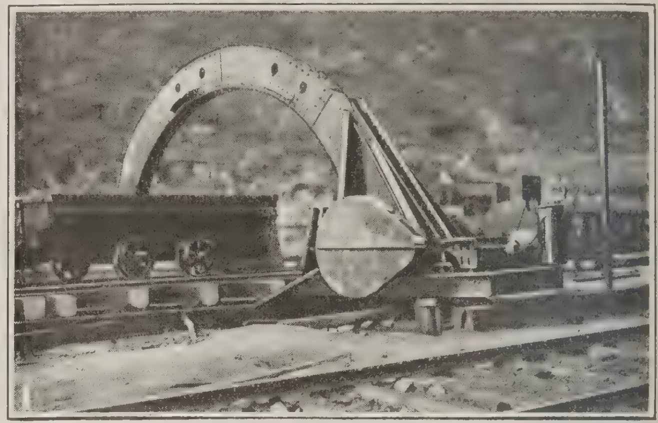
Dumping slate or rock from the end of a trestle out of solid-end cars is more difficult than if the cars were of the swing- or lift-end-gate type. Those drift and slope mines which use rotary dumps are confronted particularly with this difficulty. However, the dumping from the end of a trestle with any type of car in most cases is a tedious method. When refuse of slate and rock is to be used for grading and extending the yard in a direction parallel to the existing tracks, then it has been the usual practice, regardless of the type of mine car, to unload the refuse by hand and shovel. This laborious method always worries the progressive mine foremen or superintendent who is trying to reduce his mining cost.

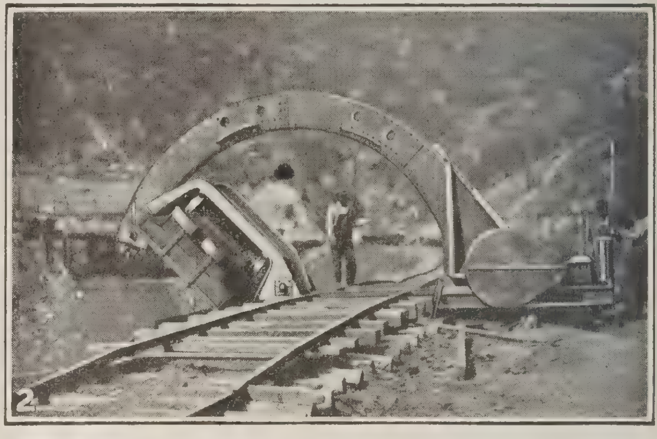
H. H. Braden, mine superintendent of the Blue Diamond Coal Co., of Blue Diamond, Ky., was bothered by his dumping problem but now he feels that it is well solved. This was accomplished by the designing and buildinig of the semi-portable side dump shown in the accompanying illustrations. Two of these dumps, the first of their kind ever built, have been in use for about three months at Blue Diamond mine.

Referring to the accompanying illustration (2), it will be noted that the machine proper is essentially a motor-driven rotary dump with the pivot somewhat above and to one side of the rail. The dump is semi-portable and simply sits on top of the track, the car platform being but a few inches above the track rails. The two sections of the track which form the approaches are entirely separate from the machine. The ties of these sections are notched on the bottom side so as to hold the approach rails in line with the track. Whenever it becomes necessary to move the dump, the approaches and the machine are slid along on top of the rail.

A 6½-hp. (intermittent rating), compound-wound, interpole motor connected to the mine trolley furnishes power to operate the dump. The machine is equipped with a drum controller and a hand brake. The free end of the dumping platform is connected to an endless roller chain which operates through the arc of the curved boom, the idler sprocket being mounted in the extreme end. From the illustration (2) it might be guessed that the controller end of the dump would have to be heavily counterweighted but this is not true, for the fulcrum is at the track rail near the platform pivot, and, moreover, the greater portion of the load is out of the car before it passes beyond the vertical.

The old and the new methods are shown in the illustration (3). On the end of the trestle in the background can be seen the overturning dump formerly used. This dump required considerable man power, which item together with the time taken to push each car out on the trestle and back again made the dumping a slow and costly process. In addition to these disadvantages, the old method had that of depositing the refuse in a line perpendicular, rather than parallel, to the mine yard. In the foreground can be seen the refuse that has been dumped by the new machine. Metal-covered skids are used to help carry the material, thus prolonging the dumping per setting of the machine.





2

3

**Semi-Portable Dump in Operation**

(1) The car goes on the dumping platform to be overturned sideways. When the refuse pile is built up as far as possible at this point, the dumping machine with its approaches will be skidded a short distance on top of the track to a new position. (2) The car is tipped to the extreme position. The wooden ties of the dump approaches are notched on the bottom so as to hold the sections in line with the track. The fact that the dump is of the cross-over type simplifies the handling of cars. (3) In the background is the trestle and overturning dump formerly used. Here the refuse is deposited in a line perpendicular to the main track rather than parallel as is desired when building yards or when the dumping space is limited by lack of depth. Although the car being dumped in the foreground has not reached the vertical, a large portion of its load has been discharged.

This dump is of the cross-over type, which is one of its distinct advantages. The cars of slate are switched onto the dump siding as they are brought-out of the mine. Then, after being run over the dump, the empties are in line ready for the return trip. Since it has been put into use the dump pictured has been handling up to 100 cars of slate per day.

# In Ohio Sixty-Nine Industries Pay Higher Compensation Rates than Coal Mining

## Yet Mining in Ohio Is More Hazardous than the Average for the Whole Nation—Window Cleaning Rate Eight Times that of Mining—Wrecking and Painting Bridges Five Times

**By R. Dawson Hall**
Engineering Editor, *Coal Age*

IS MINING the most hazardous industry? That appears to be a belief common among the general public, but the compensation figures do not seem to substantiate this notion. An analysis of the figures for Ohio, has been compiled from "The Ohio State Insurance Manual" for July 1, 1924, with the figures corrected according to the 1925 schedule, excluding all occupations that were omitted in that later table. In this book can be found 723 classifications. In 69 cases the scheduled rates are higher than for coal mining taken as a whole but omitting the groups engaged in culm, slack and coal-refuse washing, strip-pit mining, taking care of idle mines and acting as coal-mine committeemen. All of these are occupations rated less hazardous than coal mining.

Window cleaning has a rate eight times as high as coal mining and wrecking and painting steel structures and bridges over five times as high. The construction industry has a large number of counts higher than coal mining and, it should be added, a few lower. In the table none but the rates given for coal mining have been considered. In fact disregarding the five coal-mine classifications there are 649 occupations less risky than the mining of coal, none of which has been tabulated. They have been omitted from this article solely for lack of space. Perhaps attention should be drawn to the fact that shaft sinking (56), a common operation in the starting of coal mines, is more hazardous than coal mining and is classified here perhaps inadvisedly as an industry not incident to the mining of coal. The workers often do not belong to the United Mine Workers of America.

If coal mining were not treated as a composite hazard but as one broken up into several distinct hazards, many of these risks would exceed the risk of coal mining taken as a whole, but many would be far lower.

### Disease Hazard Is Low

It should be remarked that the disease hazard, which has recently been added and which has been taken in this computation without change from the 1924 manual, is not as yet scientifically computed on the five-year experience. It is added to the accident rate to make the total rate. In all cases, however, it is so small that, though it does put some of the hazards out of the order they would otherwise occupy, it does not raise any of them to a level above that of coal mining in general. Thus if they were omitted in the calculation they would not reduce the number of hazards which are estimated as greater than coal mining.

It will be noted that the lowest figure set by the Industrial Commission of Ohio—namely, one mill per $100 of payroll—has been apportioned to coal mining. The rate for the lead-using industries, including painting, is 400 times as large, and for the rubber industry 100 times as large, which shows how the commission rates the disease hazard in the State of Ohio. Whatever the disease rate may be in Great Britain and in Europe in general, in the United States it is so low as to be practically negligible.

It may be said that mining in Ohio is perhaps a relatively safe occupation as compared with other states. But that is not so. The number of fatalities is early obtained but we are longer in getting the number of employees. It is therefore necessary to go back to 1923. The record shows that in that year the number of fatalities per one thousand 2,000-hour workers was 3.96 whereas for the Pennsylvania anthracite field it was only 3.01 and for bituminous mines in general 3.84.

### Dangers in Ohio Above Average

The fatality rate in Ohio from 1919 to 1923 inclusive per one thousand 2,000-hour workers was 3.99, for the anthracite region 3.27 and for the whole of the United States 3.53. Thus it is obvious that the dangers of coal mining in Ohio are certainly not the lowest in the country and that Ohio therefore is not a state to be chosen by a propagandist who might try to prove coal mining less dangerous than some say it is. The Ohio facts speak for themselves. Mining is more hazardous there than in the United States in general, yet among industries it is rated only seventieth in point of risk to the workers.

It must be remembered that the compensation rates are not so much indexes of the operating hazards as of the amounts paid as a result of the hazards. Were the sums paid for injury or death proportional in every case to the wage earned before death by the injured or accidently killed, the compensation rate would be almost a perfect indication of the hazard, but as the law of Ohio in 1921 stood, and probably still stands, the payment at death is 66⅔ per cent of the weekly wage and not over $15 per week. Thus the comparison of compensation rates is only entirely reliable when the wage is below $15 per week or is the same as the wage in the industry with which it is compared.

Furthermore, the law requires that the compensation for death be paid for eight years but that the aggregate shall not be less than $2,000 nor more than $5,000. As $15 per week is the amount paid when the wage is $22.50 per week it is evident that quite a few of the dependents of higher wage men do not get two-thirds of the salary of the deceased, and as $6,240, which is $15 per week for eight years, is more than $5,000 it is clear that the dependents of the day worker are likely to get their $15 for less than eight years. This will lower the compensation rate for a high-wage industry. However, with these considerations duly digested and properly allowed the tabular information is of great interest.

## Workmen's Compensation Rates of Industries More Hazardous than Coal Mining in Ohio, Effective July 1

| Description of Industry | Accident Rate | Disease Rate | Total Rate |
|---|---|---|---|
| | Per $100 of Payroll | | |
| 1—Window cleaning | 25.00 | 0.002 | 25.002 |
| 2—Wreckers (not marine) | 17.00 | 0.002 | 17.002 |
| 3—Painting (steel structures and bridges) | 16.50 | 0.40 | 16.90 |
| 4—Powder M'f'rs (gun or blasting) | 15.00 | 0.002 | 15.002 |
| 5—Blasting (Payroll to include the whole compensation of all employees engaged in the storage, handling or use of explosives and all men employed wholly or in part in work preparatory to blasting, such as loading, capping, connecting and firing | 15.00 | 0.002 | 15.002 |
| 6—Aeroplane operation (demonstrating, testing, instructing, public exhibition, trick or stunt flying) | 15.00 | 0.002 | 15.002 |
| 7—Draying and hauling of heavy machinery, etc. | 13.00 | 0.002 | 13.002 |
| 8—Dynamite magazine helpers | 10.00 | 0.002 | 10.002 |
| 9—Erecting on corrugated iron buildings or covering buildings with corrugated iron (building already constructed, no structural steel work) | 10.00 | 0.001 | 10.001 |
| 10—Caisson work for building and bridge foundations (payroll to include all employees working under air pressure only) | 10.00 | 0.001 | 10.001 |
| 11—Tunneling, including all work to completion | 10.00 | 0.001 | 10.001 |
| 12—Bridge building (metal) | 9.00 | 0.001 | 9.001 |
| 13—Pile drivers | 9.00 | 0.001 | 9.001 |
| 14—Bridge building (not otherwise classified) | 8.00 | 0.001 | 8.001 |
| 15—Scrap-iron and junk dealers, away from shop | 8.00 | 0.001 | 8.001 |
| 16—Building movers (wooden) | 7.50 | 0.001 | 7.501 |
| 17—Torpedo manufacturers | 7.00 | 0.002 | 7.002 |
| 18—Riggers (not ship or boat) | 6.50 | 0.001 | 6.501 |
| 19—Subway construction | 6.50 | 0.001 | 6.501 |
| 20—Trees, pruning, spraying, repairing, trimming and fumigating | 6.30 | 0.001 | 6.301 |
| 21—Conveyors and hoisting apparatus (coal and ore, installation of, in connection with docks) | 6.00 | 0.001 | 6.001 |
| 22—Iron work (structural-erecting—building construction) | 6.00 | 0.001 | 6.001 |
| 23—Building movers, other than wooden (including shoring of buildings) | 6.00 | 0.001 | 6.001 |
| 24—Sewer building (depending on depth, highest rate) | 6.00 | 0.001 | 6.001 |
| 25—Metal-stamping works | 5.50 | 0.02 | 5.520 |
| 26—Saw mills including all employees whose duties require their presence in or about the mill and the hauling of cut lumber | 5.50 | 0.02 | 5.520 |
| 27—Sandstone quarries (for building, sawed or grindstones) | 5.50 | 0.001 | 5.501 |
| 28—Tuck pointers (cleaning exterior of buildings) | 5.50 | 0.001 | 5.501 |
| 29—Threshing machines, shellers and haybalers, operation of | 5.40 | 0.001 | 5.401 |
| 30—Cornices and sky lights (repairing and erecting). | 5.25 | 0.001 | 5.251 |
| 31—Logging and lumbering operations with transportation of logs to mill | 5.00 | 0.20 | 5.020 |
| 32—Scrap-iron dealers | 5.00 | 0.002 | 5.002 |
| 33—Lime quarries with or without blasting (no crusher) | 5.00 | 0.001 | 5.001 |
| 34—Smokestack and chimney erecting (metal) | 5.00 | 0.001 | 5.001 |
| 35—Vaults, fire and burglar proof (construction and installation) | 4.50 | 0.001 | 4.501 |
| 36—Autogenous welding, oxyacetylene | 4.50 | 0.001 | 4.501 |
| 37—Railroad construction (grade crossing work) involving all work incidental thereto (excluding iron and steel erection or the laying of new sewers) | 4.50 | 0.001 | 4.501 |
| 38—Electric light and power companies, construction of transmission lines not intended for local distribution | 4.50 | 0.001 | 4.501 |
| 39—Oxygen and hydrogen mfrs. (electrolytic processes) | 4.25 | 0.03 | 4.280 |
| 40—Bridge works | 4.00 | 0.02 | 4.020 |
| 41—Stone crushers (not limestone), including quarrying with or without blasting (not otherwise classified) | 4.00 | 0.001 | 4.001 |
| 42—Masonry work, building chimneys only (no structural iron or steel) | 4.00 | 0.001 | 4.001 |
| 43—Garbage works, reduction and incineration of garbage or offal | 4.00 | 0.001 | 4.001 |
| 44—Dredging by floating dredges | 3.75 | 0.001 | 3.751 |
| 45—Boat builders, iron, concrete, steel or wood, not otherwise classified, where staging or scaffold is used, including shop and yard work | 3.75 | 0.001 | 3.751 |
| 46—Railroad signal, erecting or installation (not including operation of railroads) | 3.60 | 0.001 | 3.601 |
| 47—Railroad construction, electric, horse or cable or installation of electric equipment or pole lines connected therewith, including culverts, not more than 10 ft. span, urban lines entirely within the corporate limits of one city (no tunneling or bridge building) | 3.60 | 0.001 | 3.601 |
| 48—Tar manufacturers | 3.50 | 0.030 | 3.530 |
| 49—Wood-tank builders (shop only) | 3.50 | 0.020 | 3.520 |
| 50—Stone crushers (no quarrying) | 3.50 | 0.001 | 3.501 |
| 51—Iron work, erecting balconies, fire escapes, railways, staircases, coal chutes, iron shutters (outside of building) | 3.50 | 0.001 | 3.501 |
| 52—Concrete bridge work, building, piers, abutments and foundations (no caisson work) | 3.50 | 0.001 | 3.501 |
| 53—Concrete work—Buildings, including foundation —Reinforced or concrete construction with self-bearing floors or other horizontal floors or surfaces or parts constructed by means of reinforced concrete. Payroll to include those engaged in making, setting up and taking down frames, scaffolds and falsework | 3.50 | 0.001 | 3.501 |
| 54—Stone crushers | 3.50 | 0.001 | 3.501 |
| 55—Roofers (not otherwise classified) | 3.50 | 0.001 | 3.501 |
| 56—Shaft sinking (must include all wages expended in the sinking of shafts and installation of lining, footways, machinery or hoist equipment therein) | 3.50 | 0.001 | 3.501 |
| 57—Railroad hazard (operating contractor's risk) | 3.50 | 0.001 | 3.501 |
| 58—Railroad operating, freight only | 3.50 | 0.001 | 3.501 |
| 59—Sign painting or lettering (over 20 ft. from ground) | 3.50 | 0.001 | 3.501 |
| 60—Badge (metal) manufacturers | 3.30 | 0.020 | 3.320 |
| 61—Telegraph and telephone lines (construction only) | 3.30 | 0.001 | 3.301 |
| 62—Quarries (not lime or cement) with or without blasting (not otherwise classified) | 3.25 | 0.001 | 3.251 |
| 63—Lime quarries, with or without blasting, including stone crushing | 3.25 | 0.001 | 3.251 |
| 64—Quarries, with or without blasting, bluestone, graphite or marble for monument or building purposes (no quarrying for dam or bridge work) | 3.25 | 0.001 | 3.251 |
| 65—Sand and gravel diggers including washing and screening operations (no stone crushing or canal, sewer or cellar excavation or grading) | 3.25 | 0.001 | 3.251 |
| 66—Tank or gasholder erection (metal) | 3.25 | 0.001 | 3.251 |
| 67—Electric light and power companies (operation, maintenance, extension of lines and making service connections) | 3.25 | 0.001 | 3.251 |
| 68—Telegraph and telephone companies (operation, maintenance, extension of lines and making service connections) | 3.25 | 0.001 | 3.251 |
| 69—Refrigerator cars (refrigeration and caring for freight in cars during transit, including loading and unloading) | 3.20 | 0.001 | 3.201 |
| 70—Coal mining | 3.10 | 0.001 | 3.101 |
| Culm, slack or coal-refuse washing | 2.50 | 0.001 | 2.501 |
| Care of idle mine | 1.25 | 0.001 | 1.251 |
| Coal mining (surface) | 1.00 | 0.001 | 1.001 |
| Coal-mine committeemen | 0.60 | 0.002 | 0.602 |

### "Thar's Coal in Them Air Hills"

Two of the Blue Diamond Coal Co. operations at Blue Diamond, Ky., viewed from under the cables of an aerial tramway which conveys the picking-table refuse to a dump on the other side of the mountain. At the left is the new side of the Blue Diamond mine. The scraper-type retarding conveyor from this mine together with that from the old mine discharge into a common tipple. At the right of the picture is the Sapphire mine, of the Blue Diamond company. This formerly was a Jewett, Bigelow & Brooks mine and was bought from the receivers last winter.

# Coal May Capture Alcohol Market from Wood

### German Water-Gas Process Produces Methanol With Such Success That This Wood Alcohol Substitute Interests U. S.

COAL MAY some day win the alcohol market now held by wood. Methanol, a product distinctly competitive to wood alcohol, is now being made from coal by the water-gas method with such success by the Germans that there is some perturbation felt among wood distillers of this country. By the German process, methanol or methyl alcohol ($CH_3OH$) is produced and sold to meet the demands of industry now filled by wood alcohol, which is methyl alcohol with certain impurities. The importation of this coal synthetic methanol by the United States increased from 40 gal., or almost nothing, in January of this year, to 70,000 gal. in March.

Before the war Germany purchased about two-thirds of the total exports of wood alcohol from the United States. Today we are rapidly losing our foreign and even our domestic market. As it is difficult to ascertain the German costs of production and even to determine the American costs, because the distillation of wood also produces calcium acetate, tar and charcoal, it will be no easy matter for the Tariff Commission acting with the President to adjust the tariff on wood alcohol above the present rate which is 12c. per gallon.

American distillers of wood alcohol are going into battle with the German producers of this synthetic methanol, Dr. Charles H. Herty, president of the Synthetic Organic Chemical Manufacturers' Association, said June 18 at the semi-annual meeting of the association at Bellport, Long Island. He said:

"We seem to have recovered somewhat from the first demoralizing shock of imports of large quantities of synthetic methanol. The American industry is now stripping itself for the fight. It is good to know that Government agencies which may be able to aid in the protection of the wood alcohol industry are investigating the whole situation carefully, and we may confidently hope that all possible aid will be given.

"The Synthetic Organic Chemical Manufacturers' Association has a very direct interest in this situation. Methyl alcohol is used in large quantities by our industry, and whatever may be the outcome of a future contest between domestic manufacturers of methyl alcohol by either destructive distillation or synthetic processes, nevertheless the synthetic process has not yet begun in this country and we must use our efforts to see that we are not dependent upon a foreign source of supply for this important material.

"So far as I can see, the very serious danger which at one time threatened our industry from loans made by bankers here to the German chemical industry has passed. The present financial shake-up in Germany, due to the troubles of the Stinnes and possibly other groups is making our bankers wary of further industrial loans to Germany."

Two German chemists, Alwin Mittasch and Christian Schneider, residing at Ludwigshafen-on-the Rhine, Germany, on Oct. 17, 1916, patented a method of treatment of carbon monoxide and hydrogen—which gases, by the way, are the main constituents of water gas. The two gases either alone or in admixture with other gases are passed over a heated catalytic agent under a pressure exceeding that of five atmospheres.

According to the nature of the catalytic agent employed and the conditions of working, different compounds or mixtures are obtained, for instance, liquid hydrocarbons, either saturated or unsaturated, and alcohols, aldehydes, ketones and acids. In order to obtain larger quantities of liquid compounds, it is often advantageous to employ gas mixtures in which the percentage of hydrogen contained is comparatively small. As instances of catalytic agents which can be employed may be mentioned cerium, chromium, cobalt, manganese, molybdenum, osmium, palladium, titanium, zinc, and also oxides or other compounds of these metals, and, if desired, mixtures of two or more of these catalytic agents can be employed. It is often advantageous to add a basic compound.

In one test pure asbestos was impregnated with pure cobalt oxide or osmium oxide and placed with a little caustic soda in a coppered iron vessel with steel jacket. A mixture containing one part of pure hydrogen and two or more parts of carbon monoxide were passed over the catalyst under a pressure of 100 atmospheres and temperatures from 300 to 400 deg. C. During the reaction some carbon was deposited, and some water and carbon dioxide produced, but methane and higher hydrocarbons as well as oxygen derivatives of the hydrocarbons were formed. These could be at once condensed or absorbed in a cold receiver. Generally an aqueous solution of aldehydes ($C_NH_{N+1}COH$) and the like was obtained in addition to a light, oily liquid consisting chiefly of saturated and unsaturated hydrocarbons, which boil up to 250 deg. C. or even higher.

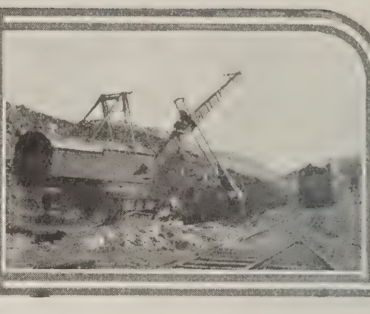
It is preferable practice to maintain the receiver under the same pressure as the reaction space and effect the condensation by cooling. If desired, a fractionated cooling can be effected either with or without releasing the pressure. In a similar way carbon dioxide can be used instead of, or in addition to, carbon monoxide, more oxygen-containing compounds and less hydrocarbons being then obtained.

## RESULTS OF OTHER TESTS

In other tests a suitable carrier, such as calcined magnesia, pumice or diatomite, was impregnated with potassium-carbonate solution. The mass was then dried and introduced into a concentrated solution of zinc nitrate, the liquid was poured off and the contact mass was then dried and heated in a suitable apparatus and placed in a vessel through which was passed a gas mixture at a pressure of 120 atmospheres and a temperature of from 360 to 420 deg. C. This gas mixture contained 62 per cent of carbon monoxide, 28 per cent of hydrogen, 4 per cent of carbon dioxide, 2 per cent of methane and 4 per cent of nitrogen. The products consisted chiefly of higher hydrocarbons and derivatives therefrom.

In this case carbon was not deposited, or, at the most, only to a slight extent. The greater part of the products capable of liquefaction or absorption could be separated at ordinary temperatures. The remaining gas generally contained olefines, such as ethylene and propylene and, further, paraffins such as methane and ethane. Analysis of the products obtained showed that the oily layer consisted chiefly of hydrocarbons of boiling points from 20 deg. to well above 200 deg. C. For instance, about two-thirds are saturated and the rest olefinic, but this proportion may vary considerably.

# News Of the Industry



## Lewis Spurns Olive Branch Offered By Anthracite Operators; No Move Yet Either by Washington or Harrisburg

No relief for the anthracite impasse was in sight early this week. Samuel D. Warriner, chairman of the Anthracite Operators' Conference, last week sent a conciliatory letter to President Lewis of the miners suggesting a resumption of the negotiations broken off so abruptly by the miners at Atlantic City, Aug. 4, but on Aug. 9 Mr. Lewis made a reply characteristically positive, characteristically ironic and one that seemed to bear out the impression that the miners are determined there shall be a strike Sept. 1.

The miners' position is that the operators will not grant either an increase in wages or the check-off and therefore further negotiations of any sort are useless. They are proceeding with their plans for a suspension. No move has yet been made either by Washington or Harrisburg to indicate that the federal government or Governor Pinchot of Pennsylvania will try to take a hand. President Coolidge is reported to be disappointed at the failure of the two scale committees to resume negotiations and he may cut short his vacation because of it.

In the operators' effort to heal up the break at Atlantic City Mr. Warriner's letter to Mr. Lewis said:

"It is, of course, untrue that the operators' negotiating committee is under instructions to continue to refuse any concessions regardless of the logic or merit of any of the mine workers' wage demands. The operators' committee is no more bound by instructions than your committee is bound by the demands adopted by the Scranton convention.

"You have now taken the grave responsibility of abruptly terminating the negotiations because of our opposition to your demands as adopted by the Scranton convention. In short, you take the position that 'negotiation' means instant agreement with your demands.

"There is only one really important matter to which I must refer, and that is your statement that you possess knowledge of the anthracite operators' well known policy of keeping close to an arbitrator. I cannot believe you seriously make such an accusation. It condemns itself.

"On this false premise you attack not merely a suggestion applying to this case. You attack a principle that is universally approved by right-thinking men as the best means yet devised to arrive at justice between contending parties. The only alternative is industrial strife with its attendant waste and loss to the industry.

"In spite of the terms of your letter and the breaking off of negotiations, I am hopeful that means will be found to compose the differences between us and avoid a suspension of production. Every consideration demands that this be done."

Mr. Lewis' reply contained these phrases:

"I do not desire to quibble over the fine shades of meaning affecting words and involved phrases. It remains that your Atlantic City conferees informed the mine workers' representatives, including myself, that they would reject any demand that would disturb the factor of mine costs. In addition, they rejected the request for full recognition of the union for some other mysterious reason. Your letter confirms the position of your committee. Be it so. We do not have any inclination to further argue when judgment has been given. I will be glad to hear from you when you abandon this position.

"I note your reference to my previous comments upon arbitration. I can well understand you natural irritation in the premises. I referred, of course, to the arbitration proceedings of some years ago when the final decision of the arbitrator was changed between twilight and dawn.

"We really do not care to arbitrate. Thanks for the offer."

## Another Big Merger Of Non-Union Mines Is Under Discussion

**John Laing**
President of the Kanawha Coal Operators' Association

John Laing, president of the Kanawha Coal Operators Association, stated last week that there is on foot another of the many coal mine merger plans that have been discussed in southern West Virginia. He said there had been a meeting in New York July 30 at which was presented the possibility of consolidating a majority of the producers in the Kanawha, Williamson, Tug River, New River, Winding Gulf and Pocahontas fields of West Virginia and in the Big Sandy field of Kentucky and Tennessee. An attorney in New York, whose name was linked with the proposal, said the suggestion was still merely a suggestion and that a great many bridges still remained to be crossed.

The tentative plans, as outlined by Mr. Laing, are to raise a fund of $250,000,000 with the aid of strong New York and Philadelphia banking houses in order to pay the owners of the properties 25 per cent of the determined value. An additional $100,000,000 would be desired for working capital. Bonds to cover the remainder of the property value would be distributed among the present owners of the mines. A huge corporation would operate the merged mines, with a board of ten men three of whom would be bankers and seven coal men. It was currently reported among coal men interested that the bankers who have discussed the merger will agree to finance it only if a controlling tonnage in each field is brought in. A questionnaire is now circulating among mine owners to determine what definite interest there is in the proposal.

At a special meeting of the stockholders of the Glen Alden Coal Co. held in Scranton, Pa., Aug. 10 it was voted to cancel the company's sales contract with the Delaware, Lackawanna & Western Coal Sales Co., and to effect a stock transfer plan, whereby holders of the sales company securities will receive share for share in Glen Alden securities.

# Government Subsidy Defers Crisis Confronting British Coal Industry Is Belief of Washington Observers

### By Paul Wooton

Washington Correspondent of *Coal Age*

Granting of a government subsidy to the business on which the entire British industrial structure rests is regarded in Washington as a makeshift intended only to postpone a general strike until the country is in a better position to withstand such a shock. If the coal industry in Great Britain cannot stand alone what must be the state of many other activities in that country, it is asked.

It is generally recognized in this country that the mine workers in the United Kingdom are not receiving enough pay even when judged by European standards of living, but it is hard to understand how any part of a private concern's payroll can be saddled on the taxpayer without precipitating a political crisis. It is certain that were any additional funds raised here for such a purpose they would have to come out of the industry if forthcoming at all.

The British coal industry is in a position where it cannot pay profits to owners and wages at the present rate to the men. Some one has to get along with less. The government has not been strong enough to require either the miners or the operators to get along with less. It also has been unable to influence the low-cost producers to agree to contribute their surplus profits to a wage pool.

It is recognized that the conservative leaders in Great Britain know just how unsound is the settlement which they have effected. That they were forced to such an expedient to postpone the crisis is taken as evidence that British business is in worse straits than had been realized here. In this we have much concern. Our own prosperity is dependent to an extent on the prosperity of our best customer. There are in addition reasons of state and of sentiment why the people of this country want to see the British overcome their difficulties promptly.

#### Inopportune Time for Showdown

Those who follow British affairs closely point out that nearly any time other than the present would be better for the inevitable showdown which must come in Great Britain. The policy of the party in power has been to concentrate on efforts to stimulate trade rather than to consume all its energies in pursuing such a will o' the wisp as German indemnities. Their efforts, along with the bettering of world trade, have brought about an improvement in the British situation. The subsidy evidently was granted in the hope that the improvement would continue with sufficient rapidity to make the task easier some months hence.

Profits at British coal mines are peculiarly dependent on volume of output. The kingdom is more dependent on foreign trade than any other country. Most of its industries must be operated near capacity before satisfactory earnings are possible. If the buying power of the tropics, of Germany and of Russia should increase in marked fashion there would be a chance for some settlement of the coal controversy.

The chances, however, seem to be very much against a sufficient recovery of business to pull Great Britain out of its depression. The more general prediction is that there must be a general readjustment of British trade with much less reliance placed on coal. This change, however, must be spread over a long period. It involves the mechanization of the mines and the development of a superpower system. Most important of all is the working out of some plan that will induce the mine worker to do his best.

#### Reduced Wages Inevitable

The British coal industry is in no position now to await gradual improvement. Something has to be done promptly to reduce costs. Since labor represents three-fourths of all costs, a reduced wage offers the more immediate way of meeting the situation. The expectation here is that it will have to be resorted to sooner or later. This doubtless will mean a general strike and a finish fight with organized labor. British labor in all lines has adopted a policy of discouraging productivity on the part of the individual worker. Nothing less than the weakening of the unions can supplant this policy with one which encourages maximum individual productivity, many think.

Under the readjustment which is expected Great Britain will withdraw to a centain extent from the world coal trade and try to use larger quantities at home. No country, it is declared, has a better oportunity to utilize superpower to advantage. Plenty of condensing water is available for power plants in the coal fields. Electric power could be made available throughout the country at a cost which would give British manufacturers some advantage. Then by specializing in the manufacture of products which require large amounts of power and by concentrating in addition on the production of goods of high quality, British industry could be put on a basis which would employ the nation's resources, manpower and brains to greater advantage than at present. One effect on this country probably would be the export of more coal.

While this readjustment is being brought about it is believed that the British will be able to get along fairly well on the business that they will be able to do with the slowly recuperating world and their income from foreign investments. This later source of income is considerable.

## Bell Lost $10,932,000 In Five Years

John A. Bell, one of the largest coal operators in western Pennsylvania, whose affairs have been public concern for months through the failure of three banks with which he was connected, went into voluntary bankruptcy Aug. 7 in Pittsburgh, listing his assets at $1,628,535.73 and liabilities of $8,669,097.81.

The day before the bankruptcy petition was filed a committee of three, known as the John A. Bell Creditors' Committee, which had been working for months to conserve the assets of the coal man, filed a preliminary report on its work, showing that Bell had lost through various operations, nearly all coal, a total of $10,932,000 in five years. Included in these losses were $6,500,000, or his entire investment, in the Carnegie Coal Co.; $389,000 in the Tasa Coal Co., $300,000 in the Harmon Creek Coal Co. and $297,000 in the Salkeld Coal Co. A total of $400,000 was lost in minor corporations, including other coal companies.

The bankruptcy petition was filed hurriedly, to forestall an involuntary petition by creditors.

Bell, who was almost as well known as a banker, declared in his petition that his occupation was a coal operator. He cited that between 1915 and 1925 he contracted debts representing both cash borrowed and property purchased by him personally totaling $4,797,331, of which $1,277,323 is secured and $3,520,007 is unsecured.

All his assets, including obligations due him, personal property, his home—everything except $175 in clothing—have been turned over to his creditors.

## Winifrede Coal Co. Closes Cincinnati Office

A landmark of the Cincinnati coal trade passed July 30 when the Winifrede Coal Co., of which Frank B. Stewart is president, closed the office that has been maintained in the First National Bank Building and shipped all books of record to the mine office at Winifrede, W. Va. The company owns 15,000 acres of land in West Virginia, including five mines at Winifrede, about fifteen miles from Charleston, and one mine at Belmont, Ohio. These mines are capable of producing 600,000 tons of coal annually. Two years ago the company bought a $100,000 washer for the mines. It also owns a short railroad which carried the coal from the mines to the Kanawha River.

It has been months since a ton of coal has been mined at the big mine at Belmont, and since the first of the year the five mines at Winifrede have worked only in fits and starts.

The Pittsburgh Coal Co. has placed a contract for the construction of a new tipple at Montour Mine No. 9, near McDonald, Pa., which was destroyed recently by lightning. The loss was estimated at that time at $100,000. The contract has been given to a Bethlehem concern. There will be no hurry in its construction, as the mine is idle.

## Mine Accidents in June Caused 145 Deaths

Accidents at coal mines in the United States in June, 1925, resulted in 145 deaths among the employees, according to information received from state mine inspectors by the U. S. Bureau of Mines. The fatality rate, based on the month's production of 44,971,000 tons of coal, was 3.22 per million tons, as compared with 4.15 in the preceding month and 4.16 in June, 1924. Seventeen of the 145 fatalities were due to a mine explosion at Sturgis, Ky., on June 8. In June last year 14 lives were lost in an explosion at Wilkes-Barre, Pa.

Reports covering bituminous mines throughout the country showed 95 fatal accidents in June. As the output of bituminous coal in June was 37,167,000 tons, the fatality rate was 2.56 per million tons. The rate for June a year ago was 3.44 while the average rate for June over a 10-year period, 1915-1924, was 3.58, thus indicating a marked improvement in June of the present year. The reports for anthracite mines in Pennsylvania showed 50 fatalities in June, which, based on a production of 7,804,000 tons, represents a per-million-ton fatality rate of 6.41 as compared with 7.14 for June last year and 7.23 for the month of June during the ten years 1915-1924.

Accident records covering the first half of 1925 show a loss of 1,089 lives in the coal-mining industry, which is 239 less than during the first six months of 1924. The fatality rate for January-June, 1925, based on an output of 279,949,000 tons, was 3.89 per million tons, as compared with 4.73 for the corresponding period last year. The six-month rate for bituminous mines alone was 3.45 in 1925 and 4.56 in 1924, while for anthracite mines alone it was 6.19 as compared with 5.60. Production records show an output of 234,886,000 tons of bituminous coal and 45,063,000 tons of anthracite during the first half of the present year.

An examination of the causes of the 1.089 deaths in the coal industry in the first half of 1925 and a comparison thereof with the accident record for the corresponding period last year shows a reduction of nearly 50 per cent in the per-million-ton fatality rate from explosions of gas or coal dust and a small reduction in the death rate from falls of roof and coal. The rate for accidents due to haulage, explosives and electricity increased slightly. The comparative rates for the main causes of accidents were:

| | Jan.-June 1924 | Jan.-June 1925 |
|---|---|---|
| All causes | 4.736 | 3.889 |
| Falls of roof and coal | 1.858 | 1.711 |
| Haulage | .601 | .647 |
| Gas or dust explosions | 1.541 | .797 |
| Explosives | .153 | .179 |
| Electricity | .117 | .121 |

### Stored Anthracite

Here are a few tons of anthracite stove and nut stored near the mines by one of the large producers which will help keep the home fires burning this winter. This yard is about an eighth of a mile long and holds more coal now than perhaps ever before. No doubt the reason for this is the possibility of a strike in the anthracite region.

John G. Callahan, a former member of the Morrow-Callahan Coal Co., has been selected to succeed Louis Stone as general sales manager of the Southern Coal & Coke Co., which operates seventeen mines in southeastern Kentucky and with sales offices in Cincinnati. Mr. Stone plans to return to the Wallins Creek Coal Co., in which he still retains a heavy interest. Mr. Callahan was traffic manager of the National Coal Association when J. D. A. Morrow held the secretaryship of that organization. For the past couple of years he has been connected with a trade directory published in Pittsburgh.

## Coal-Mine Fatalities During June, 1925, by Causes and States

(Compiled by Bureau of Mines and Published by *Coal Age*)

| State | Underground | | | | | | | | | | | | Shaft | | | | | Surface | | | | | | | Total by States | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Falls of roof (coal, rock, etc.). | Falls of face or pillar coal. | Mine cars and locomotives. | Explosions of gas or coal dust. | Explosives. | Suffocation from mine gases. | Electricity. | Animals. | Mining machines. | Mine fires (burned, suffocated, etc.). | Other causes. | Total. | Falling down shafts or slopes. | Objects falling down shafts or slopes. | Cage, skip or bucket. | Other causes. | Total. | Mine cars and mine locomotives. | Electricity. | Machinery. | Boiler explosions or bursting steam pipes | Railway cars and locomotives. | Other causes. | Total. | 1925 | 1924 |

# Probe of Contract-Breaking Bruited as Sabotage Again Breaks Out Openly In Upper West Virginia Strike Zone

Government investigation of the West Virginia coal fields looms up again, observers predicting that when the U. S. Senate meets again certain representatives of that body will be prevailed upon to probe the charges of alleged contract-breaking. This time it will involve the northern West Virginia fields, if it comes at all, because some of the largest companies are alleged to have resorted to breach of faith in the Fairmont field.

It is generally known that Senator M. M. Neely, who hails from the heart of the Fairmont region, probably will take no part in the proceeding, as he has assumed a neutral position in the struggle and has avoided connection with either side, but labor is banking on him.

With the return of Van A. Bittner, chief international representative of the United Mine Workers, early last week the miners have taken on a new lease of life. Energetic picketing was resumed at the Monongah opening of the New England Mine, the big Federal Mine No. 1 of the New England Fuel & Transportation Co., in Grant Town, which was the storm center in months gone by, as well as at Parker Run mine of the Fairmont & Cleveland Coal Co., the Morgan Mine of the Virginia & Pittsburgh Coal Co., Jamison No. 9, the Rachel Mine of the Bertha-Consumers Co., at Downs, and others.

Announcement was made Aug. 6, that the United Mine Workers had called off the strike at the Graselli Chemical Co. mine at Zeizing near Clarksburg and that the union men were back at work.

Commenting on the hands-off policy of the government, Bittner said in part: "The position of President Coolidge and other high government officials apparently is to allow the coal miners and operators to settle the problems of the industry. They have taken the position that the strike is the only weapon of defense left for the miners to prevent abrogation of present wage agreements by the coal operators, and the position of the United Mine Workers is that if the strike is the only weapon of defense left to enforce existing wage agreements, then they will use it most effectively by calling out every union and non-union coal miner in the United States in both anthracite and bituminous coal fields. And unless something suddenly happens to alter conditions and compel coal operators to comply with their wages agreements, the American people can expect this program to be made effective."

Sabotage has broken out openly in the region. Charles Brown and Albert Gibson, employed at mine No. 2 (Two-lick) of the Fairmont Big Vein Coal Co., were arrested last week, charged with causing $3,000 damage at the plant. Daniel Howard, president of the company, alleges that the men threw bolts in the machinery for the purpose of putting the mechanism out of commission. It was necessary to close the plant for twenty-four hours, but the mine was again working in mid-week and according to Mr. Howard ("Uncle Dan"), all of the loss was covered by insurance.

Coal operators declare that they are getting all of the tonnage that they desire. This is true especially at non-union and company contract plan operations. The Consolidation Coal Co. probably is getting one-third of its capacity, but this seems to be about all the coal that is needed for immediate shipments.

John L. Lewis, international president of the United Mine Workers, is being prevailed upon to address a large union miners' mass meeting in Fairmont on Labor Day. Mr. Lewis, it is reported, has expressed his willingness to address the gathering if he is able to leave the pressure of business incident to a general strike, which is expected to envelope him at that time.

### Leaders Discuss Conditions

Van A. Bittner, John L. Lewis, international president of the union miners, and John H. Jones, of Pittsburgh, president of the Bertha-Consumers Co., held a conference at the Ambassador Hotel in Atlantic City Aug. 7 to discuss conditions at Rachel Mine of the company at Downs, near Fairmont. The miners alleged the company has abrogated its contract and evicted miners and expected to evict more. The miners have threatened to strike the Jones plants in the Pittsburgh and Ohio districts unless the Rachel plant operates union.

In the first two days of last week the non-union mines produced 2,848 cars of coal. The output on Aug. 3 was 1,472 cars, which was within striking distance of the daily peak attained July 28, when 1,524 cars were loaded. Union mines in two days loaded 472 cars of coal. The union production Aug. 4,—237 cars—was the largest reached since the strike began April 1.

Mine No. 1 of the Cleveland & Morgantown Coal Co., located in Scott's Run, resumed operation on a union basis last week. Officials of the United Mine Workers asserted last week that they had organized a number of non-union miners at the Parker Run Mine of the Fairmont & Cleveland Coal Co., at Fairmont.

Everything is quiet in the Panhandle section of northern West Virginia, there having been no recent developments.

---

The Davis Coal & Coke Co., operating in West Virginia, Maryland and Pennsylvania, has been following a progressive safety program for the past eight years which has resulted in a steady decrease in accidents. At present every employee holds a Bureau of Mines first-aid certificate. It is the only company boasting of such a record in Maryland and Pennsylvania and is one of three in West Virginia.

### *When a Feller Needs One*

The most difficult problem of administration which T. T. Read, Chief of the Division of Safety of the U. S. Bureau of Mines, has to face concerns colored cooks on the ten mine-rescue cars. "The difficulty," says Mr. Read, "is to provide a source of amusement for the cook while he is alone on the car, which is a large part of every day. We have only two cooks who appear to be satisfied, one who has grown fat in the service and the other who has subscribed to a correspondence course in voice culture."

## Seek Peace Between Races in Southern Coal Fields

The program of the Commission on Inter-Racial Co-operation has been introduced into the coal fields of southwest Virginia, field secretaries of the commission addressing hundreds of colored miners in public meetings and holding conferences with white leaders of the communities. Dr. C. B. Bowyer, surgeon for the Stonega Coal & Coke Co., Stonega, Va., is a member of the district committee. Dr. J. P. McConnell, East Radford, Va. is district chairman.

The aim of the commission, which is made up of representative white and colored leaders of the South, is to help to a better understanding and to a truer and wider conception of one of the most important factors in industrial relations today — a program whereby the two races can live side by side in peace without doing violence to customs and traditions.

The full program includes health, housing, sanitation, education, crime prevention, justice in the courts, economic improvement and the promotion of good will between the races. The work is non-political and non-sectarian.

James D. Burton, of Oakdale, Tenn., is traveling secretary for the commission in southwest Virginia, Tennessee and Alabama.

---

## Prizes for Coal-Saving Ideas

The Pennsylvania R.R. is seeking to obtain widespread expression from firemen, enginemen, hostlers, coal chute operators and other employees immediately concerned, of new ideas and helpful suggestions on the problem of saving coal. Prizes of $50, $25 and $10 in the Eastern, Central and Western regions for the best three original articles written by firemen and enginemen on the general subject of saving coal are offered. Locomotives on the Pennsylvania consumed approximately 15,000,000 tons of coal in 1924. The railroads of the country in 1923 bought 159,918,000 tons of coal at a cost of $537,202,000. The cost of coal represents 31 per cent of the total purchases by railroads, and 10 per cent of the total cost of transportation, being the largest item of expense, next to labor, that a railroad is called upon to meet.

## *Persuasion by Prayer Now Enjoined*

Two miners were arrested at Henryetta, Okla., Aug. 8 charged with disturbing the peace. Their arrest followed an order by Sheriff John Russell forbidding "further outdoor prayer meetings," and other gatherings in the mining fields. "Prayer meetings" have been a recent feature of a strike which started last spring when a number of operators attempted to reduce wages to the 1917 scale.

Miners and their wives have gathered daily at the mine gates and as workers departed have prayed for their safety and invoked divine help in persuading them to abandon their labors. Hymns have been sung.

In a conference with Governor M. E. Trapp, Okmulgee County authorities declared that the working miners found it unpleasant to have the men they have dispossessed praying daily for their physical safety. They said that the meetings carry a veiled threat against the peace of the mining field and for that reason have been barred.

Sixty-two National Guardsmen and Okmulgee County deputy sheriffs were on duty in the Henryetta mining district Aug. 8 and operations continued quietly. A habeas corpus hearing on that day for the two miners charged with disturbing the peace was continued until Monday.

## Judge Gray Dies

George Gray, once a leader in the U. S. Senate, an ex-Judge of the Circuit Court of Appeals and the last survivor of the commission which negotiated the Treaty of Paris in 1898, died at his home in Wilmington, Del., Aug. 7. He was 85 years old and had been ill since last December.

Besides his many other activities, Judge Gray had been a member of the Permanent Tribunal of International Arbitration at The Hague. He came into prominence as an international figure in 1898 when President McKinley appointed him one of the commissioners to Paris to negotiate the treaty of peace with Spain upon the conclusion of the Spanish-American War.

In the anthracite strike of 1902, when both sides seemed hopelessly deadlocked after five months of controversy, the operators called upon President Roosevelt to name a commission to arbitrate. He designated Judge Gray, chairman; Brig.-Gen. John M. Wilson, Bishop Spalding of Illinois, Edward W. Parker, Thomas H. Watkins, Edgar E. Clark and Carroll D. Wright. The commission's efforts at conciliation were successful; both sides made concessions and the miners went back to work. Three years later Judge Gray as arbitrator brought peace to Alabama coal fields after months of strife.

## Hoover Committee Studies Organization and Policy Of U. S. Bureau of Mines

Initial sessions of Secretary Hoover's advisory committee on the activities of the Commerce Department affecting the mining industry were devoted entirely to the presentation of organization questions raised by the transfer of the Bureau of Mines. The committee sat Aug. 6 and 7. Most of the time was devoted to hearing the views of the directors of the Bureau of Standards, of the Bureau of Mines and of their division chiefs. The Bureau of Foreign and Domestic Commerce submitted a written statement.

The committee acted formally in electing as its president J. V. W. Reynders, who is president of the American Institute of Mining and Metallurgical Engineers, and as its secretary C. P. White, chief of the Coal Division, Department of Commerce.

Secretary Hoover explained at the opening meeting that he is anxious to know what value the mining industry attaches to the work which the Bureau of Mines has done and what suggestions it has for the future conduct of the Bureau, now that it is associated more closely with the agencies in the Department of Commerce which have been serving the mining industry.

The committee learned that fundamental issues are involved. Apparently the form of organization of the Bureau of Mines will be analyzed and other forms of organization considered.

The committee will hold its next meeting in Salt Lake City in September, where contact will be established with numerous representatives of the industry. It is planned to discuss the matter with those actively engaged in mining enterprises.

L. S. Cates, president of the American Mining Congress, was unable to attend the meeting in Washington. He was represented, however, by James F. Callbreath, secretary of the Mining Congress. Philip Murray, of the United Mine Workers, also was prevented from coming and sent F. P. Hanaway, his assistant, to represent him. D. M. Folsom, the representative of the American Petroleum Institute, could not attend, but the other members of the committee — Chairman Reynders, Secretary White, J. G. Bradley, of the National Coal Association, and H. Foster Bain, former director of the Bureau of Mines—were in attendance.

One of the important points which the committee will consider is the correlation of the work of the division of mineral technology and the division of mineral resources in the Bureau of Mines and the relation of that work to the Bureau of Foreign and Domestic Commerce.

## *Nova Scotia Strike Ended; Men Return to Work*

Coal miners of Nova Scotia employed by the British Empire Steel Corporation, who had been on strike for more than five months, agreed by a majority of 1,133 in a referendum Aug. 5 to return to work under the proposals of the Provincial Government. There were 6,693 votes polled, many of the miners not voting.

The terms of settlement were accepted on the next day by the British Empire Steel Corporation and the men were to return to work on Monday, Aug. 10, at most of the mines. Two of the collieries, however, are closed down indefinitely on account of flooding. Premier Rhodes of Nova Scotia announces that as speedily as possible the government will appoint a commission to make an exhaustive inquiry into the coal trade of the province.

Resumption of work is under an interim six months' contract pending a thorough investigation of the industry. Wages paid will be those of 1922, or a reduction of 6 to 8 per cent from the 1924 rates, and working conditions will be those of 1924. The government will rebate one-fifth of its coal royalties. The controversial check-off system of union dues being collected by the company will be submitted to a referendum held by the government.

*Wide World Photos.*

**Hoover and Advisory Committee Discuss Policy of Bureau of Mines**

The advisory committee appointed by Secretary Hoover of the Department of Commerce to consider questions of policy and reorganization in connection with the transfer of the Bureau of Mines from the Department of the Interior to the Department of Commerce, held their first meeting Aug. 6. Left to right: C. P. White, chief of the Coal Division of the Bureau of Foreign and Domestic Commerce; F. P. Hanaway, of the United Mine Workers, Pittsburgh; J. V. W. Reynders, president American Institute of Mining and Metallurgical Engineers, New York; Chairman, Secretary of Commerce Herbert Hoover; J. G. Bradley, ex-president, National Coal Association, Dundon, W. Va.; J. F. Callbreath, secretary of the American Mining Congress, and H. Foster Bain, former director of the Bureau of Mines.

# Viewpoints of Our Readers

## Out West They Laugh (Yes They Do!)

I operate a small coal mine in the great West in competition with southern California fuel oil, so you might think that I never laugh; but anyway, every time I pick up a *Coal Age* and read about the operators in the effete East I get a good laugh. Every time a southern California real estate man's helper drives a fence post into a new subdivision of Los Angeles and something squirts up into his eye and he says: "This must be oil," and and it *is* oil and he sells stock to some retired coal magnate, we laugh some more. When a string of oil tankers comes through the mine yard, then we say that it must be hell to mine coal close to West Virginia with union labor.

But, like the operators close to West Virginia, we never kick. Sometimes when I read in *Coal Age* about some operator in the effete East who wants the other stiff to hold up prices, I get a big idea and decide to go down to Los Angeles and call a convention of real estate and oil men and ask them not to open up any more subdivisions and to hold the price of oil up so that we can sell coal at a profit.

The birds that work in this mine are funny. They have to have pancakes for breakfast every morning and sometimes ham and eggs, so I say to them: "You can't have enough pay to buy pancakes and ham and eggs unless you can go down in the mine and dig coal like a gopher digs dirt and throw it clear up on the tipple like oil out of a gusher, and it's got to be mostly big lumps at that."

Then they say: "We can't spout coal like a gusher does oil, so we better go to logging or building concrete highways," and I think that this is a good idea, especially the concrete highways, because the oil men in southern California are buying plenty of tax-exempt securities so that we can have lots of concrete highways, and they never have any money left over to lend to coal operators.

So we just sell coal to people who don't burn oil *yet*, and charge them a good price so that the guys can have their pancakes and sometimes ham and eggs and we can eat regular too. There aren't very many of us and there may be *less* because oil is like a non-union operator, only worse. Whenever I see in *Coal Age* that some operator in the effete East has fixed it so that the operators in West Virginia will sell only pancake- and maybe ham-and-egg-coal I am going to write him and ask him to come out here because I want him to go down to California with me and talk to the oil operators. A WESTERNER.

Renton, Wash.

## Oil Burners Grieve in Silence

There must be many cases in which the purchasers of oil-burning equipment are discovering to their sorrow that they have been "stuck." Unfortunately, few ever hear about them because the unfortunate purchaser does not want his friends "to have the laugh on him."

A personal friend of mine told me his oil burner was working fine, but that it was more expensive to use oil than coal. This is what his next-door neighbor, also an intimate friend of us both, told me "on the side": It is impossible to tell how much oil is in the tank without measuring it with a stick, and the stick is almost worn out poking it down into that tank. When the last of the oil is pumped up into the secondary tank in the cellar it holds only a day's supply, and the oil man must get there immediately. Consequently, the first question he asks his wife at night is: "Has the oil man come today?" They have to be calling up once every ten days for oil. The truck delivers between 300 and 450 gal. at 10c. a gallon at a time, making his heating cost about $125 a month, whereas, this householder used to burn no more than five tons of coal in that time. During the winter and heavy snows it was difficult to find the intake of the outside oil tank for it was continually getting frozen over. The man on the oil truck put the pipe hose into the mouth of an old drain in the backyard by mistake and delivered untold gallons into the sewer before he discovered his error.

If one would find out just how the plant of an oil burner is working, ask his neighbors. They will know, and they seem to enjoy the other fellow's difficulties. It is only the fact that many oil users are afraid of getting the "big laugh," that prevents a lot of adverse information coming to our ears.

## "Candlepower" Is Passing

The advent of modern research and the results obtained have altered many of our old-time standards, and in the subject of lighting some of our everyday terms have proved to be illusory. The old conception of candlepower is being exploded, for we now have lamps the illumination of which bears no relation to their so-called candlepower.

I recently submitted to test various types of lamps from the old Davy to the modern electric cap lamp. The method of comparison was a new one, the experiments being conducted in an underground gallery, in roadways with both black and grey walls, representing the coal face and roadways respectively.

The suitability of the lamp was determined by the distance at which ordinary objects could be seen readily and picked up, also by the distance the lamps could be placed back from the black wall representing the coal face and still adequately illuminate certain operations, such as undercutting either by hand or machine. A further point considered was the area of wall illuminated by the hand lamp so as to determine how often the lamp must be moved to obtain adequate lighting.

This method of measuring illumination had the advantage of simplicity and, undoubtedly, would appeal more readily to the imagination of the ordinary mine worker than any elaborate photometric test.

During the discussion of the paper describing these tests,* a well-known lamp maker and voluminous writer on the subject frankly gave as his opinion that "candlepower" as applied to safety-lamps was meaningless, but at the same time he made no suggestion of a term to take its place.

Dr. Llewellyn, a well-known authority on underground illumination, uses the foot-candle as a standard.

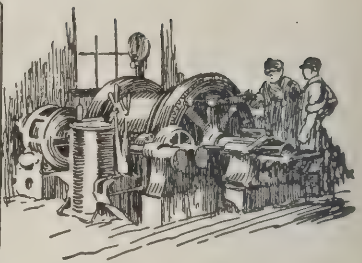
# Practical Pointers For Electrical And Mechanical Men



## Automatic Switch Thrower Aids Motors In Moving Trips to Tipple

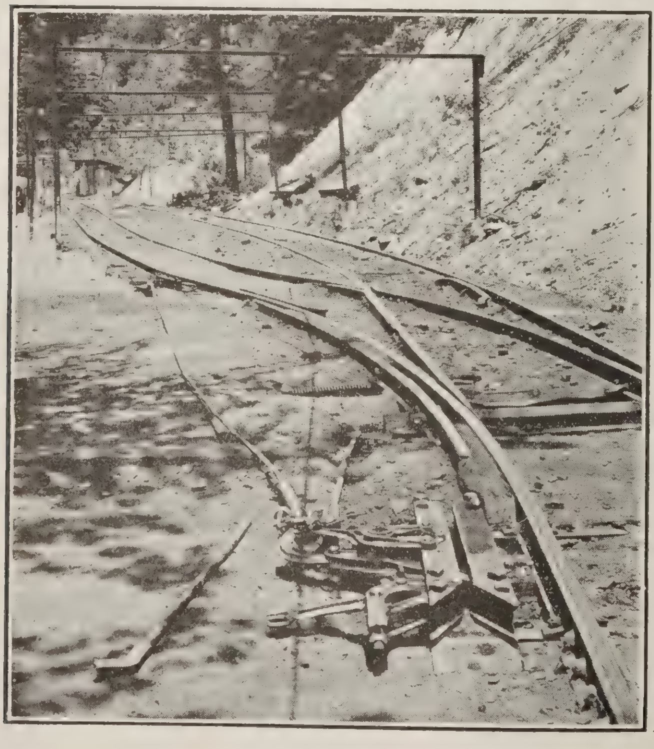
The Gay Coal & Coke Co., near Logan, W. Va., alert to increase the efficiency and lessen the accident risk of every part of its operation, has installed an automatic switch thrower at the turnout to a by-pass track on the main outside tram road leading to the tipple. By means of the thrower the motormen are able to control the movements of their locomotives over, into or out of the switch, and in this respect the switch is made selective.

But it is in the changing of positions by the locomotives from the front to the rear end of a trip so as to simplify the movements in backing the cars to the tipple that this device serves its greatest usefulness in this installation. This shifting operation is performed by the motorman without any aid from the trip rider who thus avoids the danger of jumping from a moving locomotive—a customary practice where a hand-operated switch is employed.

In the accompanying illustration are seen the essential details of the switch thrower. These are designated as the "tripping device" and the "switch thrower." In addition, bolted to one side of each tram locomotive is a lever mechanism called the "traveler."

A locomotive moving on the right-hand or main track on its way to the tipple with a trip of coal cuts loose from the cars in the clear of the frog, and alone crosses over the frog and switch. In doing so the traveler on the locomotive is depressed by the motorman to pass through the guides and engage a finger-like lever on the switch thrower which opens the switch behind the locomotive.

The locomotive being in the clear of the switch which is now open reverses its direction, passing through the switch and onto the by-pass track. A short distance beyond the frog on the by-pass track is the tripping device which likewise is engaged by the depressed traveler, closing the switch. The locomotive continues in motion, passes the standing trip on the main track, goes through a spring latch at the far end of the by-pass track and pulls up at the rear of the trip which it then backs to the tipple.



**Switch Needs No Hands**

When a loaded trip comes up on the right-hand track, the locomotive cuts off and proceeds forward through the switch, lowering a "traveler" bar into the slot in the switch thrower (foreground). This throws the switch-point so the motor can back into the by-pass track. When the "traveler" engages the tripping device beside the rail in the middle background, the switch is closed. The motor then runs around the trip and pushes it to the tipple.

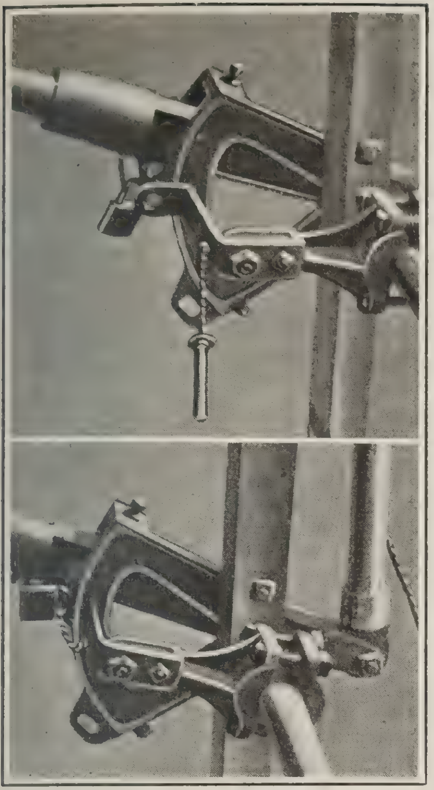
---

### Interlock Protects Mine Electrical Service

Constant co-operation between power and coal company men leads more and more to the use of devices that make continuity of service a reality today whereas a few yeras ago uninterrupted service was scarcely to be hoped for.

Annoying interruptions have been eliminated in some instances by the power company supplying service over two sets of lines, either of which may be used through double-throw switches. However, in such cases it is frequently necessary for the central station to request that the colliery workmen change over from "No. 1 line to No. 2 line" to permit change of insulators, repairs to switches, or other manipulation of line No. 1. Often this affects more than one colliery and involves not only the delay of tripping off all the load at the main oil switch, with consequent loss of tonnage, etc., but also necessitates phoning instructions to the more remote operations affected by the change. Sometimes, interruptions of as long as 20 min. are experienced before pumping and other operations can all be normally resumed.

At one of our mines two sets of air-break switches were installed to replace two double-throw switches. An agreement was reached with the power company to parallel the two lines in the process of changing from one line to the other. There then remained only the difficulty of determining what to use for a satisfactory interlock to insure the opening of the first line after the second line had been placed in service. The interlock to be described was designed to meet the conditions imposed. It



Interlocking Device Prevents Use of Lines in Parallel

The upper illustration shows the switch handle coming into position. The lower picture shows the switch in place and locked by means of a pin and padlock. The switch handles are arranged so that they cannot be locked unless one switch is open and the other closed.

was necessary that there be: (1) Insurance against accidental paralleling of the lines. (2) Simplicity of operation with rugged construction. (3) Positive interlocking that would make it impossible for an operator to walk away from the tower leaving both switches in.

To accomplish the desired results the two switches were mounted on top of a tower side by side. The operating rods were reversed so that when both operating handles were in the down position one switch would be open and one closed. The open switch could then be closed by pulling the handle into the up position. In this manner the lines were paralleled. Pulling the other switch handle up opened the first line. When both handles were up, as before, one switch was open and one closed. The switches lock in this position so that this last condition always exists when the switches are left in.

As the system works now, both handles can also be locked in the up position or in the down position. This is arranged as follows: A 1¼-in. galvanized pipe is run across the tower, on the right-hand end of this pipe is riveted one handle so that when it is moved the pipe turns. In effect, it is a long shaft operated by the handle and rotated in rough bearings. This handle then performs two functions, namely, operating its own switch and rotating the shaft. On the left-hand end of the pipe shaft the other operating handle pivots loosely, operating only its own switch. On the pipe shaft near this handle is clamped a short arm having a hole at the end of it.

When both handles are up, or both down, the hole in this short arm comes opposite the hole in the handle and the stationary hole in the quadrant in which the handle moves. A pin is provided to enter these three holes and a padlock hangs ready to snap through an opening in the end of the pin. The pin is attached to the short arm by a length of chain; the padlock is similarly chained to the operating handle. These chains are so short that it is impossible to use the pin and padlock unless the three holes are lined up either in the up position or in the down position; so one switch must be in, and one out before the final operation of locking the switches can be accomplished.

It is a simple matter, when lines are to be changed, to unlock the padlock, remove the pin, put in the switch that was open, thus paralleling the lines, and finally pull out the first switch in order to line up the three holes again to insert the pin and lock.

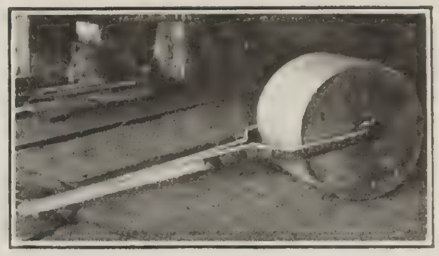
To further avoid confusion a large lettered sign concisely stating the whole procedure to be followed is hung on the structure facing the operator.

Electrical Engineer.

## Old Belt Pulley Now Serves as Hand Lawn Roller

Particularly during recent years, commendable pride has been exhibited in the appearance of mines and mining plants throughout the country. Lawns, flower beds and the like have taken the place of many an unsightly scrap heap. Lawns, however, cannot be properly cared for without suitable tools. The accompanying photograph shows a hand roller recently built in the shops of the Kingston Coal Co., Kingston, Pa., for use on company lawns.

This roller was once a large belt pulley driving a coal crusher. The openings in the end of this pulley were, however, filled with heads made of boards. In the center of each head a trunnion was fastened.



Ready for Use

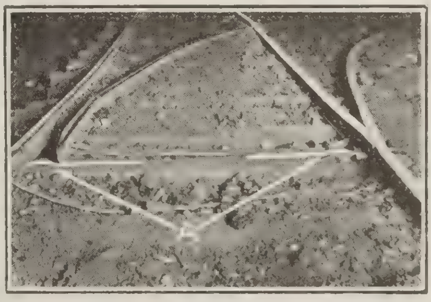
This roller, the main portion or member of which was once a belt wheel, is here shown in the shop where it was built. An eye-bolt has been placed upon either side of the bail. These may form the attachment for two ropes so that in case the ground is so soft and yielding that one man is unable to handle this roller, three or more can pull it along.

The rest of the construction—a two-piece bail and a tongue or handle—was easy. By making this roller, not only was an old, practically scrapped article turned to a useful end, but a far more serviceable and durable machine was obtained than ordinarily could be purchased in the open market.

## "Humped" Strap Reduces Mine Car Wrecks

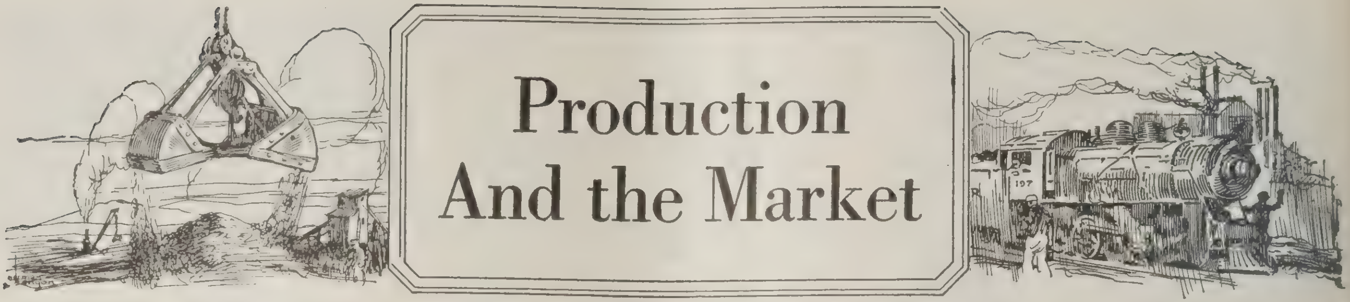
Many mine car derailments occur at room turnouts because latches do not stay in the position in which they are set. In fact so serious is this aggravation that many mining men believe it would pay to employ switch throws on room switches in spite of the cost. The Island Creek Coal Co. overcomes much of the trouble without the use of switch throws by spiking a humped iron strap on the tie under the points of the latches.

The hump lies inside of the latch point when the latter is set against the rail as shown on the right side of the switch in the accompanying illustration, and on the outside when the latch point is set away from the rail as shown on the left side of this illustration. The humped bearing bar holds the points to the position in which they have been set.



Holds Switch Points Tight

The iron strap with the hump in each end ("A") will not let latch points joggle out of position. This lessens derailments at room turnouts.



# Production And the Market

## Upturn in Soft-Coal Market Continues; Anthracite Trade Lively

Demand and inquiry for soft coal continue to improve and a gradual betterment in prices also is in evidence; as production is keeping pace pretty closely with the increased movement of tonnage to consumers' prices advances on the whole have not been especially marked. There is every reason to believe, however, that the upturn will continue to gain headway, particularly if there is suspension of operation at the anthracite mines, as seems almost certain.

There was a letdown in buying of Illinois and Indiana coals in Midwest markets last week, most consumers having got under cover the week before in anticipation of a price advance Aug. 1. The experiment in mail-order coal selling, incidentally, is said to be falling behind the expectations of its sponsors, though an improvement is looked for this month. Steam coals continue to be weak and erratic. Demand is improving in Kentucky and the general outlook is better. Prices are gradually advancing in eastern Kentucky, being unchanged in the western fields. The situation at the head of the lakes is coming around satisfactorily, better bookings and inquiry being noted. Mines in Kansas and the Southwest are reopening in anticipation of better business, which has not appeared as yet. A slight improvement in demand in Colorado has caused a small increase in operation, but the Utah market continues to drag.

Shippers at Cincinnati are sitting tight, letting the buyers come to them, and prices have stiffened right down the line. Coal movement through the Cincinnati gateway from West Virginia and southeastern Kentucky broke all records during the week ended Aug. 1. Domestic demand is slightly stronger in southern Ohio. Week to week changes are slight at Pittsburgh but a slight gain has been made in the last month. A weakening tendency has appeared in New England, the market having been somewhat overplayed. Gradual improvement is in evidence at New York and Philadelphia but Baltimore and Birmingham are practically as dull as ever, except for some increase in export activity at the former port.

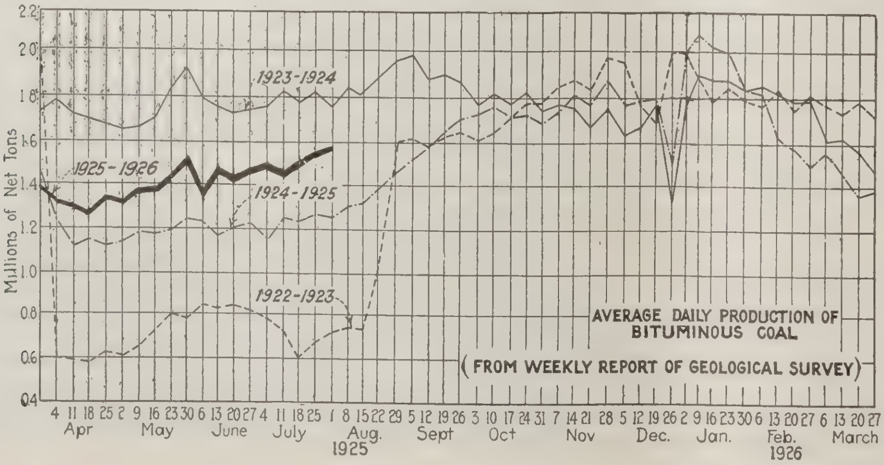
### Hard-Coal Trade Brisk

Business is lively in hard coal as the likelihood of a suspension of operation increases. The companies are nearly sold out on all sizes. Stove is in strong demand, closely followed by egg. Chestnut is moving well too and pea is coming from storage piles to meet the call. Steam sizes have picked up strongly and the independents are getting full prices for their product without any difficulty.

Bituminous coal output in the week ended Aug. 1 is estimated by the Geological Survey at 9,482,000 net tons, compared with 9,343,000 tons in the previous week, as shown by revised figures. Anthracite production in the week ended Aug. 1 totaled 2,087,000 net tons, compared with 2,049,000 tons in the preceding week.

*Coal Age* Index of spot prices of bituminous coal advanced three points during the last week, standing on Aug. 10 at 166, the corresponding price being $2.01.

Dumpings at Lake Erie ports during the week ended Aug. 9 were: Cargo, 901,800 net tons; steamship fuel, 40,189 tons—a total of 941,989 net tons, compared with 987,996 tons in the previous week. Hampton Roads dumpings in the week ended Aug. 6 totaled 461,260 net tons, compared with 445,793 tons in the preceding week.



### Estimates of Production

(Net Tons)

| | 1924 | 1925 |

| Cal. yr. to date | (*c*) 6,502,000 | 5,848,000 |

(*a*) Revised since last report. (*b*) Subject to revision. (*c*) Minus two days' production to equalize number of days in the two years.

### Midwest Market Has a Lull in Buying

Following the price advance in the Middle West on Illinois and Indiana domestic coals as of Aug. 1 there was, as was expected, a little lull in buying and orders dropped off, as practically everyone who was in the market had placed orders before the increase. The publicity being given to the anthracite wage negotiations and until recently to the British situation led to active buying, and it is reported that several of the larger corporations operating mines in Illinois have made definite arrangements to reopen their mines permanently for the season. Most of the mines being reopened are in Franklin, Williamson and Saline counties, although activities are reported in other fields.

The mail order coal experiment, it is said, is not meeting with the enthusiasm from the public that had been anticipated. It is thought that the mail order people will do a great deal better in August owing to the unusual situation in the anthracite fields and the usual seasonal demand.

Steam coals are week and erratic, as has been the case for some months. There has been no real buying yet and Western Kentucky operators are selling strip screenings in some cases as low as 75c. a ton.

Anthracite sales agencies in three or four instances have withdrawn all prices from the Chicago market, asserting that they are sold up until Sept. 1 and, owing to the uncertainty of the labor situation as of that date, do not care to take on further obligations. Some of the smokeless producers have quoted $3.50, f.o.b. mines, for prepared sizes to the trade and say they are getting more business than they can comfortably handle on this basis. They also are asking $2.25 @ $2.50 for smokeless mine run for late August shipment.

Domestic business in southern Illinois is coming along unusually well judging from the way the mines in Williamson, Franklin and Saline counties are working. An unusual amount of the smaller sizes is unbilled, however, and this means that some mines are considering storing a good tonnage of this coal if they hope to move the larger sizes. Some mines are working practically full time and others are down to two days a week, but conditions show considerable improvement and railroad tonnage from the shaft mines is good. Steam is slow. The strip mines are all showing good working time although a lot of coal is going out at unusually low prices. Here and there in the field a few crushers are operating on contract coal. All over these fields preparations are under way for reopening mines that have been idle for many months.

In the Duquoin field there is some increased activity, but not to the same extent as in Franklin County. Working time is three days a week for the mines that are working and strip mines are getting practically full time. In the Mt. Olive district very little is moving as yet. Steam sizes are still being crushed at some mines and railroad tonnage

**Coal Age Index of Spot Prices of Bituminous Coal F.O.B. Mines**

| | 1925 | | | 1924 |
|---|---|---|---|---|
| | Aug. 10 | Aug. 3 | July 27 | Aug. 11 |
| Index .......................... | 166 | 163 | 160 | 163 |
| Weighted average price .... | $2.01 | $1.97 | $1.94 | $1.98 |

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States, weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and, second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke; 1913-1918," published by the Geological Survey and the War Industries Board.

is light. Working time is poor, too. In the Standard field coal is going at about cost, with working time low and demand light. Steam sizes are beginning to worry the operators, but if steam is worrying them now, what will it be when business gets good on domestic? Railroad tonnage is easing with mines getting from two to three days and exceptionally four days a week. All have "no bills" and coal is selling at about cost. Prices are unchanged.

In St. Louis there is considerable activity in a retail way for the better grades of Illinois coal. Anthracite, smokeless and coke are a little slow, principally because the people who have bought this fuel in the past are now using oil. Southern Illinois high grade is moving well but Mt. Olive is not active and Standard is delivered only to cheap storage apartments. Local wagonload steam is slow and carload is easy, with no unusual demand. Country domestic is beginning to show up much better—for the better grades principally. Several sections carry no west Kentucky rates and this is making business good for Illinois. West Kentucky continues to move in volume to Illinois and Iowa points and the demand for anthracite has eased off. Country steam is light. There has been an increase in the price of domestic coals in St. Louis of about 25c. a ton.

### General Situation Better in Kentucky

Coal demand in the Kentucky fields is better than it has been and the general situation has improved. With the active season at hand prices in eastern Kentucky are gradually being advanced, the prepared sizes being about 25c. a ton higher than they were a short time back. Block has gone to $2.25 @ $2.75, with some specialty coals at $3. Lump and egg have advanced to $2 @ $2.25. Such little nut as is produced in the Hazard field is $1.75 @ $2. Mine-run is unchanged at $1.35 @ $1.75; but screenings are up to $1.10 @ $1.25.

In western Kentucky prices are unchanged over the week. A few screenings orders have been taken at 75c., but the market is 80 @ 90c. Mine-run is still weak at $1.10 @ $1.25. Nut is $1.45 @ $1.60; lump and egg, $1.50 @ $1.75; 6-in. block, $1.75 @ $1.85.

Domestic consumers are starting to stock, and retailers, noting a steady advance in prices, are stocking their yards. Industrial consumers are playing safe and ordering steam coal in quantities.

Steam buyers have been fooled this year. They had anticipated 50c. screenings out of eastern Kentucky, but the market has remained at $1 and over. It has been an unusual year in that respect. Part of this has been due to the smaller production of prepared in the union districts, throwing a heavier industrial demand for screenings on the non-union fields. The operators also have shown greater firmness in maintaining markets. Ninety cents has been the lowest price reported for some time, and that occurred only over short periods when embargoes prevented immediate movement north of the Ohio River, which meant unloading in Kentucky. Some good contract business has been placed of late.

### Northwest Trade Perks Up

Dock operators say the situation at Duluth is straightening out satisfactorily. Inquiry is better from dealers in the agricultural districts of Minnesota and North Dakota and they are placing orders for fair tonnages of both bituminous and anthracite. Slightly better bookings are reported also from iron mining companies on the Minnesota ranges in preparation for heavier operations, and better bookings from that quarter are expected in the near future. Ordering of steam coal by industrial concerns over Minnesota is said to be improving.

Demand for anthracite remains slow, due to the high cost of hard coal and an increasing disposition to use Pocahontas and other smokeless substitutes for heating private houses. The trade is no longer able to make use of the scarcity bogey as a rallying cry in soliciting orders, for anthracite customers know that about 575,000 tons of that coal is on the docks. It is to be noted that the movement of anthracite this way from the mines has fallen off during the last few weeks as the mining companies have been shipping to points where that coal was needed to a greater extent.

Forty-one cargoes of coal, including only two of anthracite, were unloaded at the docks last week and nine cargoes of anthracite were reported en route. No delays were experienced in unloading cargoes as they arrived, space having been made through outgoing shipments. Quotations of both hard and soft coal are unchanged but firmer.

Interest in Milwaukee's coal trade is focused upon the anthracite wage imbroglio. Dealers would like to see the anthracite moving from their docks to make room for further receipts, but householders have been slower than usual this year in ordering winter supplies. Better demand is reported, however, and dealers are urging consumers to order without further delay. The receipts of hard coal by cargo thus far this season are about the same as they were at this time last year—nearly 400,000 tons. Dealers advanced anthracite prices 10c. a ton Aug. 1, and raised the price of coke 50c.

### More Mines Open in Southwest

More mines are being opened in Kansas each week, more in anticipation of a heavy fall demand than on present market justification. A slight improvement is noticeable in the domestic market as dealers prepare for the early home demand, but householders are not yet buying. Some activity has begun in Arkansas, some under the 1917 wage scale as well as under the 1924 scale but with modifications of the 1924 contract, while some operators declare they will not reopen their Arkansas mines until they are assured they can be operated uninterruptedly at a lower cost than last year.

In the Colorado market there is a slight improvement in the demand for domestic lump and nut coal, which has resulted in a slight increase in mine operations, which are now averaging about three days a week. From now on a substantial increase in orders for immediate delivery is expected. The price on Dawson (N. M.) domestic lump and fancy egg is $4; fancy nut, $3.75; fancy pea, $3.25; base burner coke, nut size, $6.

The coal market in Utah continues draggy. Winter storage orders are increasing slightly, but they are far behind what they should be for the time of year. There is considerable talk of increasing prices and it is likely that an advance will take place at an early date. Industrial demand for coal is largely confined to the mines and smelters, cement plants and the railroads, but no industry is taking much coal at the present time. The sugar companies should be storing coal on a larger scale right away.

### Record Movement Via Cincinnati Gateway

The rapidly changing front to the Cincinnati market is best shown by the scarcity of offers of tonnage by the wholesalers who had been busiest in putting their coals before buyers for four or five months. And prices have stiffened all along the line.

In the week ending Aug. 1 no less than 14,793 cars of coal passed through the Ohio River gateways, 1,500 more than the peak record made before, or 5,164 cars more than in the corresponding week of last year. Of the grand total 5,164 cars went to the lake, making another record for a week's movement.

The West and Northwest are the best sales spots. Southern and Southeastern points that buy off this market are in a slump. Domestic lump is much firmer in price. While West Virginia prices indicate the same range, more coal is selling around $2.50 than at the low. Southeastern Kentucky producers are making $2.75 the price on their block where they have better grades to offer, though some can still be had at the $2.40 low. Mine-run has stiffened and is in demand while slack and screenings have moved up from 10c. to 20c. Egg sizings are beginning to show a seasonal lack of demand though lake buyers are after 2-in. to the point that it has advanced to a $1.75 low.

Smokeless business has had a refreshing upturn with all lump and egg now firmly held at $3 and most of the direct selling agents asking $3.25. Mine-run is $2 and a shade better where it can be had, and steel and iron plants that did not cover themselves before the leap in demand have to pay from $1.35 to $1.50 for screenings that can be booked. Here and there on this market the report comes that companies are booked up to capacity for the month except for free tonnage held for spot selling.

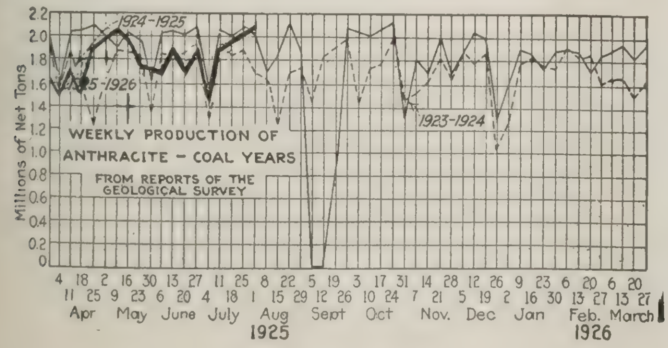
There has been no change in retail prices and river business plugs along as usual.

At Columbus there is a better demand for domestic sizes, retailers buying to replenish low stocks. A majority of orders are for immediate delivery. Householders also are coming into the market with the threat of an anthracite strike. Prices have stiffened materially, especially on the better grades from West Virginia and Kentucky. Ohio mined coals are selling better, although there is no particular increase in price. Smokeless is in good demand and retails at $8 @ $8.50; splints at $7 @ $7.50 and Kentucky block coals at about the same levels. Ohio coals both from the Hocking Valley proper and Pomeroy Bend fields are selling at $6 @ $6.50 delivered.

Little change has taken place in the steam trade, where buying is from hand to mouth. Reserves are only fair, but none of the larger users is showing concern. Contracting is somewhat better, although the larger number of users are buying on the spot market. Distress coal is not being offered to any extent and the regular prices are prevailing on spot shipments.

### Demand Gains Slightly at Pittsburgh

There is practically no change in the Pittsburgh coal market in the last week, but over the past thirty days there probably has been a slight progressive increase in demand —hardly enough to be noticed from one week to the next. It would take a great deal to move prices, there being so many mines operating part time which would be glad to sell more, but prices are as low as they can go without an actual loss to operators.



Predictions are more widespread that demand will increase substantially near future, as demand for domestic usually opens up at about this time of year, though none of consequence has yet been seen. Industrial consumers also are expected to replenish stocks, as they are unusually low.

Save for interest in the possibility of a hard-coal strike the situation at Buffalo has not changed. There is some stiffness on slack, especially the gas slack variety, and the price has gone up a few cents, but that does not indicate any increase of demand. The mines that turn out this coal are shut down largely, they say.

Some of the bituminous interests here are in line for establishing new process coke and briquet processes, but they are all in just the stage when it is forbidden to say anything about them in print.

No direct report of coal consumption is to be had, but it does not appear that there is much, if any, falling off. Factories have kept up well during the summer.

Supplies of coal in the hands of Toronto dealers are larger than usual at this time of the year and coke also is exceptionally plentiful, large stocks having been laid in in anticipation of a strike. Dealers are now finding it increasingly difficult to get orders filled at the mines. The usual fall increase in the price of anthracite went into effect on Aug. 1, several weeks earlier than in recent seasons. Quotations were advanced from $15 to $15.50 and for coke from $12 to $12.50. While a shortage of anthracite when present stocks are exhausted is not unlikely, dealers state that they do not anticipate any difficulty in supplying consumers with coke.

### New England Trade Sags Again

Once again there are indications of weakness in the New England market for steam coal. The settlement or, rather, the postponement of labor troubles in the British coal fields together with increased production in the smokeless districts of West Virginia have forced a few shippers to shade spot prices enough to move coal that was threatening to accumulate. In other words, the pressure of slightly higher prices ten days to a fortnight ago was more than certain operating interests could withstand and now the carefully built structure, the work of many weeks, is likely to fall to the ground. The top level for high-grade Pocahontas and New River mine-run on board vessels at Hampton Roads is understood to be $4.25@$4.35 and it would not be surprising to see quotations back on the May and June basis.

On cars Boston for inland delivery spot figures have slumped from $5.65@$5.75 to $5.40@$5.50, and apparently they will go lower. There is no buying of sufficient volume to support the higher prices that were asked, and in the face of expected arrivals there was bound to be a rectification from a basis that is now seen to have been artificial.

The retail situation in Boston also is affected, and dealers are finding it hard work to preserve their present price of $7.50 per net ton delivered. The impending supervision of mining in the anthracite region is causing reaction here thus far in the bituminous situation.

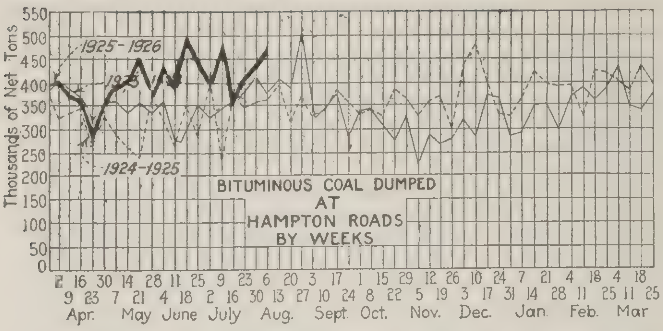
The Pennsylvania coals, both all-rail and by water, are floundering along on the same minimum price basis that has been the case for several months. Only small tonnages are anywhere in request.

### Interest Growing in New York

While there is no rush of orders the bituminous coal market at New York is in fair shape. Buying has picked up and consumers are showing more interest. This is probably due to the prospective suspension of anthracite mining although most producers believe the stoppage will have to continue for more than thirty days to affect the soft-coal industry.

Screened bituminous coal showed a little more activity the latter part of the week, but the orders were not heavy. Some operators and shippers report inquiries regarding short-term contracts, buyers showing a desire to protect themselves in the event of prolonged trouble.

There is a feeling of strength in the Philadelphia soft-coal market, as consumers are coming along with requests for quotations more freely than for some time. A good many of these inquiries are being translated into orders, but without any evidence of a rush. Some fairly good rail-



road business has been closed and the utilities also are ordering better.

The better demand has affected prices only to the extent that everyone is convinced that the present schedule cannot stand much longer. Contract customers also are calling for a better supply on their agreements, and this is helping the market.

While not much tidewater business has turned up of late, the Southern ports are shipping more heavily to Northern points on account of the possibility of anthracite trouble, and it should not be long before this market is affected favorably.

The outstanding feature of the Baltimore bituminous trade is the increased activity in export trade, more than a dozen charters having been made for August loadings from this port. The delivery points for the most part are those which have been taking British coal. The home market continues unexcited and there is not much optimism over the immediate outlook, although some of the dealers expect a considerable increase in the use of soft coal in homes as a result of present prices of anthracite, even should there be no strike of hard-coal workers to further accelerate this demand. Production continues in excess of immediate demands and competition is overkeen. There is somewhat of an increase in demand for industrial storage also and purchasing agents generally are making more inquiries than for some time past.

## Domestic Trade Dull at Birmingham

Conditions at Birmingham have changed very little in the last week. Domestic is as dull as ever, inquiry being exceedingly light in the open market and restrictions on contract deliveries have not been lifted as yet. Current production is hard to dispose of, making it difficult for the mines to handle steam business as promptly as desired, and in some instances barring the taking of additional orders. In view of the fact that there has really been no buying movement in the retail domestic trade so far and the stocking of household fuel is far behind normal at this season, improvement is confidently expected by dealers during this month. Until such relief comes activity in the wholesale market is not expected.

The steam market possibly gained a little more strength during the past week, the number of spot sales having been slightly greater as reported in some quarters. The opening of the ginning season affords a market for some additional tonnage, but otherwise the sources of consumption have not been augmented materially. Inability to dispose of domestic sizes, which hampers operations, is causing activity to be accentuated in the steam trade in a measure not justified by any material increase in requirements. Some of the well-established operations, however, have sufficient business in hand to maintain practically full-time schedules.

Production is running about 350,000 tons per week. Labor supply is in excess of needs and ample to produce the potential capacity of the field if required. Quotations are unchanged.

## Hard Coal Market Lively

Increased demand and a lively market for stove coal continue in New York. The breaking off of wage conferences and the urging by officials to consumers to fill their bins served to stimulate interest and dealers report much more activity with a desire by householders to put in coal. Independent coals are active and the larger companies have sufficient orders ahead to keep their tonnage on the move.

Egg and chestnut are in good demand, the first named following closely after stove in demand. Pea coal also is in good call, the demand showing more strength inland than in the metropolitan area. The steam coals are moving well, barley being out of the market with some producers and sales agents.

At Philadelphia the boom in anthracite is on and most of the shipping companies are nearly sold up on all sizes, with the possible exception of pea, and the local retail trade is not able to fill up its bins as promptly as earlier in the season.

All the producers advanced prices Aug. 1, the companies for the most part making the usual 10c. increase, although independent shippers added from 25 to 50c. a ton. Some of the smaller shippers are asking even more than that, but are not getting it in this market.

Stove is the wanted size, although the stage has not been reached where the local dealer is willing to pay a premium to get it. Egg also is difficult to get, and nut is moving in fairly well. Company shippers have no trouble in disposing of pea, and are even drawing on storage stocks for some of it. The independents still have a little trouble in moving this size promptly. The trade now expects a long suspension of mining.

Steam coals have picked up strongly, with all company shippers taking coal from storage yards to meet the demand. The market has gained such strength that independents are able to get full prices for their output, and before long may be able to get a premium.

Baltimore retailers are urging customers to make sure of protection during the early winter by ordering fuel at once, but the response to date has not been energetic. A number of consumers have found that they can use the better grades of soft coal in emergencies and the introduction of oil burners as a factor in the sitation also is not to be ignored. A hard-coal strike, with a shortage in supply or any further material advance in hard-coal prices at retail will undoubtedly cause the installation of many more oil burners, with a considerable permanent loss of business to both retail dealers and anthracite operators.

At Buffalo the demand for anthracite is good. Consumers have come forward with orders just about fast enough to make it possible to meet them without distress. If demand continues at its present gait the output of coal can be taken up right along and the winter-cellar stocks be pretty well replenished by Sept. 1. Independent coal is doing well and some schedule companies have sold all their small sizes.

At the same time the sale of coke does not improve much. It is hard to get people to believe in it. One shipper says that it will take either a recommendation from a friend who has used it or a shortage of anthracite. The curb price is still $9@$9.50.

Lake shipments of anthracite for the week were only 30,800 tons, being 18,000 to Duluth and Superior, 6,800 tons to Chicago and 6,000 tons to Milwaukee.

## Connellsville Coke Market Dull

Prices are unchanged in the Connellsville coke market and there is no discernible change in the volume of demand. The market is very dull indeed. Hopes are widespread but by no means universal that the coke trade is going to improve, due to a suspension at the anthracite mines. It seems somewhat curious that this is talked of as the hopeful thing, when there is merely a chance, while improvement in the iron and steel industry, which is almost universally predicted, is rarely mentioned as representing a favorable prospect. The explanation probably is that anthracite is a much bigger thing in a tonnage way.

The spot furnace coke market continues to be confined to small lots bought by miscellaneous consumers, who seem to have made up their minds that $2.90 is the price, and no more can be obtained, though many operators talk of having $3 as their asking price. Blast furnaces are not buying at all. The few in operation are covered by contracts.

Spot foundry coke remains at $3.75 to $4.25, buying being light.

# Foreign Market And Export News

## British Coal Market Unsettled by Recent Strike Threat

Business in the Welsh coal trade of late has been very unsettled due to the strike of miners threatening for so long. Practically all available supplies have been taken up by contractors, and the collieries have been left with only small parcels at their disposal. There has been no reopening of the pits closed down as unremunerative some time ago. Buyers abroad have sought to anticipate August requirements, and shipments are being made as rapidly as possible. There is a firmer tendency.

In the Newcastle market buyers have been showing anxiety to obtain prompt supplies, the result being that loading turns are filled to the end of the week and prices have risen accordingly, now standing at higher figures all round. Although this is the position for prompt delivery, there is a complete dearth of later business. Contract business is hardly in evidence.

Output by British collieries in the week ended July 25, a cable to *Coal Age* states, totaled 4,525,000 tons, compared with 4,890,000 tons in the preceding week.

## Domestic Calls More Active In French Market

The situation in the French coal market has not essentially changed. Industrial demand continues extremely low but with regard to household fuels, things are certainly looking up.

The North and Pas-de-Calais coal companies have decided to continue until Sept. 15, the allowance for the high cost of living at the rate of 20 per cent. Labor unrest has arisen in the Sarre basin, due partly to the diminished buying power of the franc in the face of the high cost of living in Germany and partly to the waning of France's prestige in the Sarre territory with the evacuation of the Ruhr by the army. This agitation has caused a decrease in output which has obliged the management of the domanial collieries to close a number of pits for several days. The miners have asked an increase in wages and the government has offered 5 per cent, which has been deemed insufficient. Therefore a strike is not unlikely.

During the first eleven days of July the Office des Houillères Sinistrées received 206,300 tons of reparation fuels including 102,900 tons of coal, 95,700 tons of coke and 7,700 tons of lignite briquets, a daily average of about 18,755 tons. Receipts for June were 505,600 tons, including 256,000 tons of coal, 224,400 tons of coke and 24,400 tons of lignite briquets. During the first twenty-one days of July the O.R.C.A. received from the Ruhr 151,411 tons of coke, a daily average of around 7,200 tons.

## Hampton Roads Market Firmer In All Directions

The Hampton Roads market was given some impetus last week by the impending hard-coal strike, and prices were strengthened, although it was largely to the benefit of the operator rather than the shipper. Numerous inquiries were reported and some rather heavy buying was in prospect, although no long contracts were being offered.

Movement of coal to Canadian ports, with scattered shipments to Europe and South America, featured the export trade. August began with great activity at the terminals, and the trade awaits with anxiety the outcome of miners' wage negotiations in the next few weeks. The tone of the market was strong.

## Belgian Market Hampered by Metallurgical Strike

The Belgian coal market, on the whole, shows no improvement. The strike of the metallurgical and structural industries has had an unfavorable effect and the extension of the conflict to the Liége Basin, up till now unaffected, is sure to be prejudicial to the collieries of that district. Of course, industrial grades are hit the hardest and in the Borinage the most men are out of work. In spite of restriction of output stocks amount to around two and a half million tons.

Demand for smalls for brick and cement making is fairly satisfactory, but it is weaker for lime-kiln fuels. There are no stocks of dry duffs in the Charleroi Basin. Household grades are quite firm, particularly dry and anthracitic grades.

# News Items From Field and Trade

## ALABAMA

The DeBardeleben Coal Co.'s mine No. 1 at Towley, one of the largest coal mines in Walker County, which was operated but little for some months, is now operating on full time. Many of the coal mines in the Birmingham district are operating from two to four and five days per week, while some are closed down entirely.

The first-aid meet at Birmingham, Oct. 6, will be featured by a demonstration of the explosibility of coal dust. The explosion test will be confined to carbide lamp ignition, it having been decided inadvisable to use the electric arc. At a later date a similar test will be given at Pittsburg, Kan., under the direction of J. J. Forbes, who is the head of the Safety Extension Service, U. S. Bureau of Mines.

## ARKANSAS

C. L. Melton, operator of one of the four open-shop coal mines at Alix, leased the Western Coal & Mining Co. mine No. 6, at Denning, last week and operations under the 1917 scale of wages will be attempted, according to reports. Melton began operations of his mine at Alix with non-union labor in January, 1924. About 35 men are employed and production will total more than 100 tons daily. Melton was the first operator in Arkansas to adopt the open-shop policy. Union miners are preparing to hold a demonstration in protest against opening the mine under non-union conditions.

## COLORADO

The Colorado Fuel & Iron Co. has made a reduction in wages effective Aug. 1. The new scale represents a reduction of approximately 11 per cent from the present which went into effect March 16, 1925, and which was a 20 per cent reduction from the former scale. A company statement issued July 31 said that all company mines in the Walsenburg district had accepted the new reduction and that the Morley mine alone in the Trinidad district, had not. The new scale cuts underground coal diggers from 82c. a ton to 80c. and day men from $6.20 per day to $5.52 per day. The same statement says the Aug. 1 scale is 5 per cent higher than the 1917 scale, on which various competing companies are now operating.

## ILLINOIS

The Chicago, Wilmington & Franklin Coal Co.'s mine No. 1, at Orient, will resume operations Aug. 17 with a force of approximately 1,000 men. Mine No. 18 of the Industrial Coal Co., where operations stopped as a result of the tornado of March 18 last, plans to reopen on Sept. 1, This mine employs 600 men. This mine is at West Frankfort. Crews are now putting the underground plants in condition.

The Missouri Pacific R.R. has filed a petition with the Illinois Commerce Commission for permission to discontinue the regular weekly miners' train from Gorham to Benton. The train, which has been operated for several years, originally was intended for use of coal miners working at the New Bush mines. The increased use of automobiles since the development of hard roads in Illinois, however, has cut the patronage of the train to a point where it is continued at a large loss.

A campaign has been started by coal operators in southern Illinois to induce consumers in that general region, as well as all Illinois institutions supported by taxpayers, to buy Illinois coal. This campaign has been furthered by the Illinois Chamber of Commerce, co-operating with Rotary Clubs throughout the coal belt and with other organizations aiding. The movement was started when a southern Illinois coal operator obtained possession of a call for bids for state institutions in which it was specified that Indiana or Kentucky coal be used. A letter was immediately written to the institution calling attention to the unfairness of this discrimination against the mines of Illinois. which contribute their share to the support of the institutions. A copy also was sent to the Illinois Chamber of Commerce, which body responded stating that it would give co-operation.

The Minork mine resumed work July 24 after a shut down of four months.

A total of $10,727,361 in coal deals including deeds of trust and quit claim deeds, has been recorded at Marion since Jan. 1, 1925, according to Fred Simpson, Recorder of Deeds for Williamson County. Upon the death of Levi P. Zeigler, of Chicago, last year it became necessary for the trustee for his estate to make a quit claim deed for approximately half of the Zeigler Coal & Coke Co.'s holdings, totaling $2,038,612. The property was conveyed to the coal company, as was the remainder of the Leiter interests in the same company, the latter deal involving $2,038,749. Later the Zeigler company made a deed of trust to the Continental and Commercial Trust and Savings Bank of Chicago for $4,000,000. A few weeks ago the Cosgrove-Meehan Coal Co. issued a deed of trust to the Seaboard National Bank of New York for $2,500,000. Recently a deed of trust for $150,000 was recorded in favor of O. W. Lyerle, cashier of the Herrin State Savings Bank by the Sincerity Coal Co. Another recent deal was the sale of the West Virginia Mine and adjacent coal lands to Charles Gent, of Chicago, who represents large Eastern coal interests.

The Cosgrove-Meehan Coal Co. is expending $125,000 on property north of its mine at Panama, in Montgomery County, for a plant to generate all electricity used in the operation of its mine at Panama, which employs 650 men. Thirty acres of ground will be turned into a large lake which will hold 50,000,000 gallons of water, to be supplied by the creek. This will furnish condensing water for the turbines. Exhaust steam, which is now wasted, will be utilized to operate the turbines. A dam 400 ft. long, 150 ft. wide at the base, 16 ft. wide at the top, and 27 ft. high is being constructed.

## INDIANA

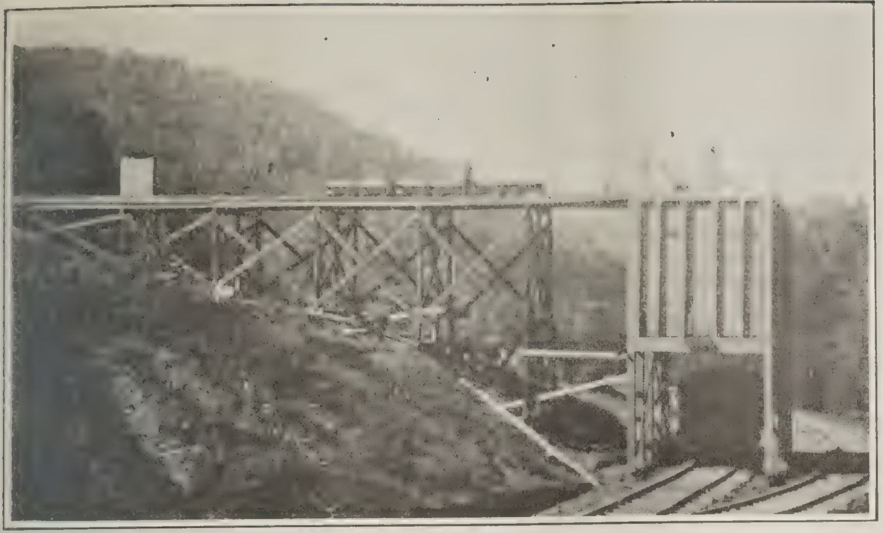
Officials of District No. 11, United Mine Workers, at Terre Haute, have received notice that Judge Claude Smith of the Circuit Court at Princeton, has found the Princeton Coal Co. guilty of violating the state mining law. The suit was filed by the state mine inspection department and the specific charge was that of firing shots while all of the miners were in the mine.

The Radiant Coal Company at Terre Haute, Ind., has filed a preliminary certificate of dissolution with the Secretary of State.

A new tipple and engine room, to take the place of the buildings destroyed by fire several months ago, are being erected by the Bosse Coal Co. and the work is almost completed. The Bosse mine, managed by Walter Korff, is located on the traction line a short distance below Boonville. With the modern improvements made, including an electric hoist, the Bosse Coal Co. is getting ready to start operations on a large scale.

## KANSAS

A demand by attorneys of Kansas coal operators for a trial by jury to determine the facts of compensation cases before their submission to an arbitrator under the Kansas workmen's compensation law was denied by Judge D. H. Woolley, in District Court at Pittsburg, Aug. 3. The judge announced that he



**Tipple and Storage Bin, St. Mihiel Coal Co.**

This simple equipment for run-of-mine coal is located at St. Mihiel, Ky., on the line of the Kentucky & Tennessee Ry. The heavy bin serves to steady the trestle and to make rapid loading possible.

would name arbitrators in the eight cases on which the defense objections were made, and thus complete the record for appeal to the State Supreme Court, where a ruling may be made on the defendants' demand. This action of Judge Woolley followed objections by defense attorneys two weeks before to the submission of compensation cases to arbitrators before the establishment of facts before a jury.

The Hamilton Coal & Mercantile Co. announced Aug. 3 that it proposed on Aug. 10 to reopen its mine No. 10, near Cherokee, in the southeastern Kansas district, which has been closed since April 6. The mine will employ 200 men. James Hamilton, Pittsburg, president of the company, also announced that five mines owned and operated by his company in Arkansas will be reopened this month.

After having been closed down soon after the shaft was sunk in the spring of 1918, No. 3 mine of the Domestic Fuel Co., near Gross, in the southeastern Kansas field, is being electrified in preparation for reopening soon. Officials of the company announced that it will be operated under lease as soon as substitution of electric for steam equipment is completed. The shaft was sunk just as the demand for men for war service began to be felt in labor districts and the difficulty of obtaining workmen was the reason given for closing it before it had begun to produce. It will start with fifty men, the number to be doubled or tripled as underground workings are developed. The mine is on 280 acres of land owned by the Domestic Fuel Co.

The first arbitration through a federal arbitrator of a miner's damage suit in Kansas began July 20, in Pittsburg, before W. P. Dillard, a Fort Scott lawyer, appointed by Judge John C. Pollock in federal court to hear the claim of Charles Warlop against the Western Coal & Mining Co. Warlop asks compensation of $15 a week for eight years for injuries said to have been received in a Western mine. The case was removed from district court to federal court by defense attorneys on the ground that the sum sought exceeded $3,000.

The Pittsburg & Midway Coal Co., which recently assembled a large acreage of coal land in Labette County for the Missouri, Kansas & Texas R.R., has bought ten acres of land near Valeda and Angola for a tipple and other buildings, but denies that work will start soon in the new field.

The Atchison, Topeka & Santa Fe R.R. is said to be obtaining leases on coal land in the vicinity of Coffeyville, through the Cherokee & Pittsburg Coal & Mining Co. Blocking work by the Cherokee & Pittsburg company is south of the tract recently blocked by the Pittsburg & Midway Coal & Mining Co. for the Missouri, Kansas & Texas R.R.

## KENTUCKY

It is reported that in the Democratic primary in Kentucky on Aug. 3 candidates opposing horse racing and favoring a tonnage tax on coal, two issues which have been linked in politics, were defeated all over the state, which today has a Democratic Governor, who is in control of that party. Feeling is that the 1926 legislative session will not be anything like as dangerous from the operators' viewpoint as it was considered a few weeks ago.

The Kentucky Board of Charities and Corrections, operating the various state institutions, which received bids on coal supplies on June 5 placed orders Aug. 4. Buying prices ranged from 90c. to $1 a ton for western Kentucky 1¼-in. screenings, f.o.b., mines, and eastern Kentucky prices were $1 to $1.14 a ton for screenings. The West Kentucky Coal Co., Paducah and Sturgis, received a 100-car order for the Hopkinsville institutions; the Coil Coal Co., Madisonville, got a 75-car order for the Eddyville penitentiary; the former at $1 and the latter at 90c. Ayers & Son, Detroit, for the Liberty Coal & Coke Co., Pineville, obtained contracts for supplying institutions at Frankfort, Lexington, and Lakeland, the price being $1.14 a ton for nut and slack; the Stearns Coal & Lumber Co., Stearns, obtained the Greendale contract, at $1.

The Morganfield Coal & Coke Co. is completing the installation of two new boilers, which will be in operation soon. The company is making other extensive improvements, having erected a new 300-ton coal bin for local trade, and installed two additional pumps. These improvements, which will cost approximately $10,000, are being made preparatory to increasing the production of the mine.

Petition was filed recently in Judge Ruby Lafoon's court at Madisonville by the Hart Coal Co. asking that the Sherwin Coal & Coke Co. be declared bankrupt. Among the creditors of the defendant company are the Curtin Coal Co., the Mineters Coal Co. and Geo. E. Hutchinson & Co. The defendant company owns a mine at Madisonville but has not operated it for some time.

A large acreage of coal land in Bell County has been acquired by the Wallsend Coal Co. of Delaware. The company purchased the property of the old Wallsend Coal Co., and will spend about $60,000 immediately on improvements. Additional acreage was acquired from Judge Louis Apperson, of Mt. Sterling, taking in the coal lands up Dorton's Branch. Other acreage was purchased from Charles Conant and in the Logan estate, in what is known as the Mt. Vincent property.

## MASSACHUSETTS

The Rochester & Pittsburgh Coal & Iron Co. has taken over the Boston office of M. L. Cobb, 10 Post Office Square, who formerly represented the company in that territory. Clarence Cobb, who succeeded his father when the latter died, about ten years ago, has retired. F. E. Clark, who represented the Rochester & Pittsburgh company in Albany for two years, is now in charge of the Boston office. William D. Scofield has taken Mr. Clark's place in Albany. These changes became effective Aug. 1.

## MINNESOTA

The Woodhead Motor Co., of Brainerd, a Ford dealer, is erecting coal sheds for the purpose of handling coal from the Ford mines in Kentucky. This company handled thirty cars of Ford coal last season.

W. H. Godwin, vice-president in charge of sales of the Carnegie Dock & Fuel Co., who was in Duluth last week, predicted that shipments from the docks would show good increases within the next month.

Officials of the Zenith Furnace Co., at Duluth, are counting upon greatly increased sales of domestic coke during the fall and winter months. Substantial stocks of coke are being accumulated to take care of the early trade. The use of coke and buckwheat mixture came into use to some extent in Duluth last winter as a substitute for prepared sizes of anthracite.

**Sawmill and Power House, Stearns Coal & Lumber Co., Stearns, Ky.**

Stearns is the point of junction of the Cincinnati, New Orleans & Texas Pacific (now part of the Southern Ry. system) and the Kentucky & Tennessee R.R. The mines of the Stearns Coal & Lumber Co. are west of Stearns, along the South Fork of the Cumberland River and Rock Creek.

The announcement that W. H. Warner & Co., of Cleveland, had purchased the interest of the Maher Collieries Co. in the Pittsburgh & Ashland Coal & Dock Co., operating a modern dock at Duluth, was noted with interest in trade circles here. The deal is said to have been prompted by the increased movement of West Virginia and Kentucky coals to Duluth.

## MISSOURI

Miners who have been employed in Mine No. 11 at Higbee held a meeting with the operators last week relative to operating the mine on a co-operative plan. The mine was recently purchased by John Italiana. One hundred and seventeen men have been employed in the shaft, but it is understood that conditions have not been good and several men have been laid off on account of lack of demand for the product. The mine's contract with the Missouri, Kansas & Texas R.R. has expired. Although the outlook is discouraging it is thought that arrangements can be made whereby the mine can be operated on a co-operative basis.

## MONTANA

An appeal to the labor men of Missoula and the Missoula public to use Montana-mined coal was the theme of a recent address before the Missoula Trades and Labor council by Stephen Ely, president of the Montana State Federation of Labor. Mr. Ely said that approximately 700,000 tons of coal is shipped into Montana each year for consumption by the Montana public from other states, principally from Utah. Montana coal fields can employ 4,000 or more men when operating on full time. At present half of that number are idle while the remaining 2,000 are forced to work on reduced time because Montana people are burning foreign mined coal.

## NEW YORK

Roy Heyser, general coal purchasing agent for the Semet-Solvay Co., has changed his headquarters from the company's plant in Syracuse to New York City.

## NORTH DAKOTA

A discovery of deeper coal beds has been made at the mines of the Washburn Lignite Coal Co. at Wilton. While sinking a well, a 9-ft. bed was found at a depth of 90 ft. and a 6-ft. bed at 140 ft. The present workings are 11 to 14 ft. thick at 65 ft. depth. Test pits will be sunk to ascertain if the new beds exist in any spread of area.

The Washburn Lignite Coal Co., of Wilton, has gone into court to prevent the state from completing contracts for furnishing fuel to state institutions, with concerns whose bids were higher than the figures of the Washburn company. The policy of the state has been to distribute the business among several firms as a guard against tie-ups of various kinds. The plaintiff company seeks to have all business awarded to it upon which it was the lowest bidder. State officials will resist the case, holding that other factors besides price enter into the matter.

## OHIO

Two eastern Ohio mines of the Clarkson Coal Co., Cleveland, with a daily capacity of 4,500 tons, were to suspend operations last week, it was announced Aug. 6 by A. C. J. Allsain, commissioner for the Pittsburgh Coal Operators' Association. The mines are St. Clairsville and Dillonville. Failure of Ohio and Pennsylvania operators to obtain lower freight rates to compete with southern West Virginia coal is largely responsible for the suspension, Mr. Allsain said. He pointed out that this action would leave but 11 of the 131 eastern Ohio mines operating at capacity.

K. M. Pinaire resigned as assistant secretary of the Pittsburgh Vein Operators Association of Ohio on Aug. 1 to engage in the practice of law.

J. P. Brennan, state purchasing agent, has received requisitions and will open bids soon for about 300,000 tons of nut, pea and slack or run of mine coal for 26 institutions in the state. This will be a winter's supply, and the coal will be all Ohio mined.

About one-half of the miners in the Pomeroy Bend field, which numbered 1,800 in normal times, are now employed. Of the 900 working about 360 are employed by the Pittsburgh Coal Co. and 160 at the Stalter Essex Coal Co. mines, all working on the 1917 scale. In addition co-operative mining at the two operations of the old Maynard Coal Co. and other small mines makes up the balance. No further trouble with union officials has been experienced in the field and miners are seeking employment every day.

## PENNSYLVANIA

Six men were killed and thirteen injured in a gas explosion Aug. 3 at the Dorrance Colliery of the Lehigh Valley Coal Co. It was two hours before the dead and injured could be removed from the scene of the blast. The cause of the explosion has not been ascertained, although it was suggested that blasting operations might have ignited gas collected in that portion of the mine. Reports that a fire followed the explosion were denied by company officials. The shaft was badly damaged.

Eight hundred mine workers at the Greenwood colliery of the Lehigh Coal & Navigation Co., who struck Aug. 1 in protest against the introduction of a time registering system returned to work Aug. 4. The men agreed to place the matter in the hands of the higher officials of the United Mine Workers. No wages are involved in the controversy.

The 600 miners who struck several days ago at the Drifton Colliery of the Lehigh Valley Coal Co. on the claim that grievances were not being adjusted as had been promised, returned to work Aug. 6. The mine committee has been instructed to again take up the matters in dispute with company officials.

The Oliver & Snyder Steel Co. has started to ship coal to the new byproduct plant of that company and affiliated interests in Troy, N. Y., which will be placed in operation as soon as the first shipments arrive there. Approximately 1,250 tons is being shipped daily to the new ovens from the Connellsville district. It is understood the new outlet has permitted the Oliver & Snyder interests to start up an idle mine.

## UTAH

Efforts are being made to have the Bureau of Mines stage its coal-dust explosion demonstration during the three-day meeting of the Rocky Mountain Coal Mining Institute, Aug. 26, 27 and 28, at Price, Carbon County. The dust from the Carbon County field is said to be the most highly explosive in the United States, and its treatment is of special interest. The committee arranging the affair consists of W. J. Reid, of Wattis; Dave Brown, of Spring Canyon, and John M. Jennings, of Hiawatha.

Practically all of the school lands in Uintah Basin are claimed by the government on the ground that the lands were of known mineral character at the time they were acquired. The state is to be sued for their title.

The John Farr Coal Co. and the Williams Coal Co., of Ogden, will supply that city's municipal government with its coal during the coming winter. The Farr company will supply screened slack at $3.90 per ton, and the Williams company, lump coal at $7.

### WEST VIRGINIA

In the recent semi-annual statement of the finances of the United Mine Workers, according to the *United Mine Workers' Journal*, $411,475 was spent in the Kanawha and $124,000 spent in the Fairmont field for relief in the six months ended June 31. W. C. Thompson, secretary of District No. 17, received $22,849.05 as administrative expenses. Attorney T. C. Townsend, chief counsel of the miners in the state, received $8,606.57. A donation of $500 to the Barrackville Disaster Relief Fund also was included.

H. E. Peters, formerly president of Sub District No. 4, District No. 17, United Mine Workers, is ill with tuberculosis at the state sanitarium at Terra Alta. Peters, who came here from Charleston in 1918 with the entrance of the union, was impeached from office.

### WYOMING

Leasing of two tracts of public coal lands in Wyoming has been authorized by the Secretary of the Interior. One of the tracts, located in Carbon County, contains 471 acres. It will be offered for leasing on the petition of Fred D. McMillen, who holds a coal permit on the land. Terms of the lease provide for the payment of a royalty of 10c. per ton, mine-run, on all coal produced, an investment of $50,000 during the first 3 years of the lease and a minimum production of 36,000 tons a year commencing with the fourth year. The other tract in Sheridan County, contains 40 acres and will be offered on the petition of the Sheridan-Wyoming Coal Co. Terms of the lease include the payment of a royalty of 10c. per ton, mine-run, on all coal produced, an investment of $10,000 during the first year of the lease and a minimum output of 4,000 tons a year beginning with the fourth year. The leases will be offered at the local land offices located at Cheyenne and Buffalo, Wyo., respectively.

### ALASKA

E. Schinck, who recently returned to Dawson from a trip to St. Paul, where he attended a meeting of the directors of the Five Fingers Coal Co., reports that plans were made for the future operation of the property. Practically all of the coal used in Dawson comes from the Five Fingers Mine.

### CANADA

Alberta coal has arrived in Toronto under the agreement with the Canadian National Railways for the experimental shipment of 25,000 tons at a special rate of $7 per ton. Owing to strike conditions at the Alberta mines considerable difficulty was encountered in making the first shipments, but it is stated that these obstacles have been overcome, and Charles McCrea, provincial Minister of Mines, who is handling the matter for the province, states that he expects that the full amount of the order will be shipped.

Canadian consumers may be burning coal mined in Australia before the end of the coming winter if the present labor difficulties both in the United States and England cause a shortage, in the opinion of C. D. Patterson, of Sydney. Australian mine owners are already making plans, he told *Coal Age*, to enter the world market in the event of a rise in coal prices. Mr. Patterson will make a survey of the Canadian market and will report to his firm as to the advisability of opening branches in the larger Canadian cities. Coal shipped across the Pacific, he believes, could be laid down in Canada at prices which would enable it to compete with that from the Pennsylvania fields and from England. Such a course, however, is likely to be followed only in the event of a shortage being caused by disputes between operators and miners on this continent.

## Traffic

### Commerce Commission Decisions and Recommendations

Division 4 of the Interstate Commerce Commission released a decision Aug. 1 in Docket 14856, Tioga Coal Co. vs. B. & O. R.R. It finds that the Strouds Creek & Muddlety R.R. is a common carrier. It also finds that rates on coal from mines on that line to interstate destinations are not unreasonable, but are unduly prejudicial to the extent they exceed the rates contemporaneously maintained on like traffic by the defendant to the same destinations from Allingdale, W. Va. The Commission also orders that through routes and joint rates on coal in carloads must be established and maintained by the B. & O. in connection with the Strouds Creek & Muddlety R.R.

This decision has the result of placing the mines on the Strouds Creek R.R. in the Gauley District. The complainants also ask that the B. & O. be required to establish just, reasonable and adequate daily car rating for complainants' mines.

The Commission finds that paragraph 12 of Section 1 of the Interstate Commerce Act requires the trunk line on whom such railroads as the Strouds Creek customarily gets its car supply to maintain reasonable distribution of cars for the transportation of coal. Therefore, the B. & O. is ordered to treat this line as any other line dependent upon it for a car supply. No order is issued in this respect, but it is stated that the B. & O. will be expected to give the same treatment in the matter of car service to this railroad as it does to its own Richwood Branch.

In Docket 15228, Board of Railroad Commissioners of the State of Iowa vs. Alton & Southern, Examiner Wm. A. Disque has recommended that the complaint be dismissed. This docket also embraces 15266, Lehigh Portland Cement Co. vs. A. T. & S. F.; 15299, Hannibal Shippers' Association vs. A. T. & S. F.; 15629, Atlas Portland Cement Co. vs. Burlington; 15860, Dolese Bros. vs. Rock Island.

There was under attack rates on bituminous coal from producing points in Illinois, Indiana and western Kentucky to points in Iowa and to Hannibal, Mo. The examiner finds the rates not unreasonable, unjustly discriminatory nor unduly prejudicial and not in violation of Section 4 of the act. Differentials as among origin groups were not directly involved in any of the cases. Many traffic and commercial organizations and receivers of coal intervened to support the complaints, while coal dock operators at the west bank of Lake Michigan and mine operators in Iowa intervened to oppose the rate reduction sought.

The report of the examiner covers the rate situation in Illinois, Indiana and west Kentucky territory at great length. After carefully reviewing all of the rates he recommends that the Commission dismiss the complaint.

In Docket 15228, Sub. No. 1—Fifth & Ninth Districts Coal Traffic Bureau vs. Santa Fe R.R., Examiner Wm. A. Disque has recommended dismissal. There was involved in this complaint the rates for the transportation of coal from points in the Belleville Group in Illinois to points in Iowa and to Hannibal, Mo.

The examiner finds the rates under attack to be not unreasonable or unduly prejudicial. It was alleged by the complainants that the rates on coal from points in the Belleville Group to points in Iowa in general are unreasonable and unduly prejudicial as compared with the rates from the Springfield Group and other groups in Illinois and western Kentucky to the same destinations. It was also alleged that defendants in many instances restrict the application of joint rates to certain circuitous routes and refuse to establish such rates over certain direct routes from and to the points embraced in the proceedings. This report also embraces Docket 15299, Sub. No. 1, the same complainant versus the B. & O. R.R.

After reviewing this rate structure at length the Examiner concludes by recommending dismissal.

### Indian Creek Case Dismissed

The Interstate Commerce Commission has dismissed complaint in Docket 15742, Indian Creek Coal & Coke Co. vs. Atlantic City Railroad Co. et al., finding that the rates on coal from points on the Indian Creek Valley Ry. to Eastern and New England destinations are not unduly prejudicial. Complaints attacked the rates on the ground that they should not exceed those maintained from the Meyersdale region.

## Obituary

**Joseph F. Dierdorff,** manager of works and chief engineer for the Jeffrey Manufacturing Co., of Columbus, Ohio, died at French Lick recently from Bright's disease superinduced by an operation for appendicitis. He was 49 years of age and had been connected with the Jeffrey Manufacturing Co. for more than 35 years, of which the last 14 years was manager of works. He was one of the best known authorities on mining machinery and conveying equipment in the country. He leaves a wife, two daughters and two brothers.

**Elmer E. McConnoughy,** a former operator in the Jackson (Ohio) district was buried in Dayton, Ohio, late in July. He had put in his life in the coal trade and was well known in southern Ohio and eastern Indiana. For the past five years he represented the Kearns Coal Co., of Cincinnati, in central Ohio. Mr. McConnoughy had been ailing for years and was afflicted with heart trouble.

## Trade Literature

The Truscon Laboratories, Detroit, Mich., recently issued new and revised specifications on all their waterproofings in a 36-page book, size 8½ x 11 in. Each specification is complete with information how to use, quantity required and illustrations. Book A is one in a series of six books.

The Federal Electric Co., Chicago, Ill., has issued a booklet illustrating and describing its **Type A Siren.** Information as to weight, prices and voltage is included.

S. Flory Mfg. Co., Bangor, Pa., has issued catalog No. 39, devoted exclusively to **gasoline hoists**, covering their general specifications and containing lists of standard sizes from 5 to 60 hp.

**Modern Methods in Diesel Engine Building.** Fairbanks, Morse & Co., Chicago, Ill. Bulletin No. 1040. Pp. 32; 8½ x 11 in.; illustrated.

The Lunkenheimer Co., Cincinnati, Ohio, has issued an 8½ x 11 in. catalog describing and illustrating its new line of **Iron Body Bronze Mounted Gate Valves.**

## Coming Meetings

**Rocky Mountain Coal Mining Institute.** Summer meeting, Aug. 26-29 at Price, Utah. Secretary, Benedict Shubart, Denver, Colo.

**American Institute of Mining and Metallurgical Engineers.** 132d meeting, at Salt Lake City, Utah, Aug. 31 to Sept. 3. Secretary, H. Foster Bain, 29 West 39th St., New York City.

**Oklahoma Coal Operators' Association.** Annual meeting, Sept. 10 at McAlester, Okla. Secretary, A. C. Casey, McAlester, Okla.

**New York State Coal Merchants' Association.** Annual convention, Sept. 10-12, at Richfield Springs, N. Y. Executive Secretary, G. W. F. Woodside, Arkay Bldg., Albany, N. Y.

**Association of Iron and Steel Electrical Engineers.** Annual meeting at Philadelphia, Pa., Sept. 14-19. Secretary, John F. Kelly, Empire Bldg., Pittsburgh, Pa.

**National Safety Council.** Annual meeting Sept. 28 to Oct. 2, at Cleveland, Ohio. Managing Director, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

**Tenth Exposition of Chemical Industries,** Sept. 28 to Oct. 3, at Grand Central Palace, New York City.

**Electric Power Club.** Fall meeting at Briarcliff Manor, N. Y., Oct. 19-22. Secretary, S. N. Clarkson, B. F. Keith Bldg., Cleveland, Ohio.

**Canadian Institute of Mining and Metallurgy.** Annual western meeting Nov. 3-5, Winnipeg, Manitoba, Can. Secretary, George C. Mackenzie, Drummond Bldg., Montreal, Que., Can.

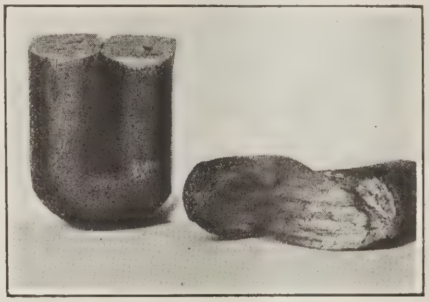
**American Society of Mechanical Engineers.** Annual meeting at New York City, Nov. 30-Dec. 3. Secretary, Calvin W. Rice, 29 West 39th St., New York City

# New Equipment

## Special Iron Evolved for Mine Car Couplings

Appreciating the need at coal mines for a high grade of wrought iron which in pins, links, draw bars and hitchings on mine cars will withstand severe tension and bending forces, the American Car & Foundry Co., of Chicago, Ill., offers a special product known as "AF iron." This iron has been evolved by a special committee of company engineers after numerous conferences with operating men at the mines and various experiments and tests in mill and forging departments.

The iron has the following physical characteristics: Ultimate tensile strength of not over 59,000 lb. per square inch; yield point of 0.6 of tensile strength; an elongation in 8 in. of 0.28 and a reduction in area of 0.40. Samples of this iron will bend cold through 180 deg. without a sign of rupture. Furthermore, after being nicked, a sample when bent cold through 180 deg. must show a long silky fiber which is free from slag, dirt and coarse crystalline spots. A specimen meeting these specifications after being subjected to this second test is shown on the right of the accompanying illustration. It must meet a third test in which the sample is heated to a forging temperature and cooled; then it is subjected to the procedure outlined above for the second test and must possess the same fibrous structure.

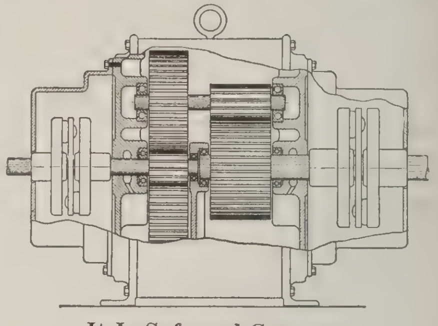


**Tough Iron**

This metal, intended especially for pins, links and drawbars for mine service, is expected to meet severest tests.

## Speed Reducer Is Equipped With Ball Bearings

A new type of spur-gear speed reducer, embodying several features and details of construction not heretofore available in machines of this kind, has recently been placed on the market by the Albaugh-Dover Manufacturing Co., 2100 Marshall Blvd., Chicago, Ill. As may be seen in the accompanying illustration, this machine consists of a train of any desired number of pairs of spur gears all totally inclosed, running in an oil bath and mounted on ball bearings. The flexible couplings attaching this device to the driving motor upon one end and to the shaft of the driven machine upon the other are also inclosed in an auxiliary housing making the complete unit unusually compact.



**It Is Safe and Compact**

This broken-away view illustrates the simplicity of this type of spur gear speed reducer inclosed in a housing which includes safety covers around the flexible couplings.

Gear ratios in this machine may be made as large as strength and good wearing qualities of the teeth will permit. Inasmuch also as any desired number of single reductions or gear pairs may be embodied, the total reduction between driving and driven shaft may be made as large or as small as desired. Carrying all shafts on ball bearings assures the least possible loss of power in useless friction.

Machine design and fabrication at present is undergoing a more or less radical change. A few years ago the exposed train of gears was the all but universal method by which power was transmitted from a high-speed driving to a low-speed driven shaft. Nowadays it is becoming more and more the common practice to supplant these bulky exposed gears with some form of inclosed speed reducer. These devices are far more compact, less noisy and more economical of power than the older gear trains.

## Industry Shifts Again

BY KEEPING UP the railroad rates on anthracite and by the prescription of joint rates on prepared sizes of low-volatile bituminous coal the Interstate Commerce Commission has greatly relieved the minds of those citizens who were perplexed as to what they would do in case of an anthracite strike. The hard-coal operators have reason to be alarmed. Fuels once established have a way of "staying put." It is the first step that counts in many cases.

Having learned how to handle a new fuel, having accustomed oneself to its disadvantages—all fuels have them—the consumer does not usually go back. It is not cheering to anthracite operators to read in the commissioners' report what they must well know that approximately eight hundred government buildings in or near Washington that were heated by the combustion of anthracite are now kept warm by the use of low-volatile bituminous coal. It appears as if the recent decision of the Interstate Commerce Commission might put a crimp in the anthracite business from which it will never recover.

As for the union it must look with distress at the possibility of more business going to the non-union regions and leaving the highly unionized anthracite field. It must dread the loss of the strike, for the public will now not be alarmed, and the panic on which the union counted will not occur. The operator may be compelled to fight the battle through, for the public will not care whether the anthracite mines work or remain idle. They will make shift either way.

So now the union will grow weak just where it is strongest, namely, in the anthracite region. It is a hard life that of union leader and union man these days, but one must say that both make a bold front in a losing cause.

Inflation of the industry will be the outcome of the decision, for some of the regions favored are not equal to meeting the needs of the new markets and most of them are insufficiently equipped to supply prepared sizes. New tipples and a revamping of old ones will be the natural result. All the many shifts in the coal industry cause inflation. Every newly developed field, every strike, every unfair wage contract, every revised freight rate does its part, and it seems likely that this new freight decision will with the Jacksonville agreement do much to build up West Virginia.

## Coaxing the Ovens Back to the Mines

WHEN THE OVENS were wasteful, black and smoky, they were always located at the mines. Now that they are efficient and make less smoke they have moved over to industrial centers and seem likely to stay there because it is expensive to pipe gas long distances and any process of coking or low-temperature distillation makes a large quantity of gas available.

But what is important is that we, who have seen the coking industry move rapidly from mining centers, realize that when conditions favor they may come back and perhaps be operated by the mining companies. The ovens at Béthune, France, point to that conclusion. The Companie des Mines de Béthune is making alcohol and ammonia out of the ethylene and hydrogen respectively found in coke-oven gas.

In making the first the ethylene is combined with sulphuric acid to form sulphovinic acid which is then treated with steam. As a result, alcohol and sulphuric acid are formed; by the use of which latter the process can be repeated indefinitely. That ethylene is found only in small quantity in the gas is a disadvantage but it can be concentrated to from 20 to 30 per cent so that it will act readily on the sulphuric acid which is further is activated by the admixture of sulphovinic-acid.

It is interesting to note that this company also manufactures synthetic ammonia by means of the hydrogen in its coke-oven gases using the Claude method. It is in the cooling process by which the hydrogen is concentrated that the ethylene is removed, benzol, ethylene, methane, carbon monoxide and many other hydrocarbons being extracted at the several stages.

From the coal mines will come in the future many of the most important of our industrial products, and at the coal mines will the process be elaborated. Apparently Europe, in *this* chemical development, as in others, is taking the lead.

## Who Has the Broken Leg?

READING the newspapers we learn that the coal industry has a harmful strike habit, which being interpreted in the light of facts means that the miners in the industry have made striking a biennial practice. A story goes that there were twins who shared all things in common and when one fell and fractured a limb, the other proudly announced "We-uns have a broken leg."

In like manner the coal industry, which is not one but two persons, operator and miner, is said to have aggregately the strike habit and to be grievously in need of a cure. But if in the study of disease we do not go so far as to study which of the twins is in need of treatment the curative action is not likely to make any progress. The public should ferret into this deep subject a little further and arrive at the conclusion, as to which person it is that has the broken leg. The formula in surgery runs: Find whose leg and which is broken and mend that. Quite simple and obvious, it is true, but important.

In the instance now before the country the anthracite operator wants arbitration, no suspension and a long contract with revisions made by some competent authority whenever occasion demands it, and it is the miner who wants a strike or, as he prefers to term it, a suspension. But the public groups them both together and treats them both alike with condemnation. They both have, to quote the public, "the strike habit," as both the twins in common possession had a broken leg.

In the early years of the past century, France had the war habit. Presumably our ancestors put it generally as we do and said that, to *Europe*, war was a second nature for we like ever to generalize, recognizing that it saves thought. The French won wars repeatedly; their legions invaded nearly every European land and with success until defeats in Russia and at Waterloo occurred, and the war habit for a while, at least, ended. A Waterloo would end the the strike habit for the miners. They have won so long that they expect their leaders to win more and more ground for them. The public has always given way to them, and they expect to consolidate their gains and press forward year by year. In time they will prove that a high order of skill is needed in the industry by the high rate of pay always conceded to them. They will prove also its risk by the fact that the work is well paid. But, as has been said, a setback or two will kill the strike habit, and the industry will be relieved of its broken leg.

As it has been the public which has granted the repeated increases and has given way every time there was a demand, therefore, the public must be blamed for the leg fracture and from the public should come the cure.

The wrong-headed are insisting that the operators and miners are in collusion to raise wages and to put up prices. After the Pinchot settlement increasing wages 10 per cent, company coal of domestic sizes rose from $8.18 to $9. There was no profit in such a small increase. No one can say the Pinchot award was used as an excuse for profiteering. Just the reverse, it was a heavy burden on coal-company finances.

But if the public desires still to believe in this collusion, and no one can argue satisfactorily with the skeptical, let it call on the miners for arbitration and no suspension. Then the operators, who they say have the strike habit and want a strike, will be fooled and everyone will be happy. Let the public take the anthracite operators at their word and give them arbitration. If they really want a strike and have shouted "Peace" just to mislead us, they will be truly unhappy when the public takes them at their word. And when the operators are unhappy every one rejoices. This is the way to tantalize them; give them what they ask.

## Is the Miner a Skilled Workman?

"HIGH WAGES for skilled men" is one of the slogans of the mine worker. It is true that there are men in the mines who justifiably may be termed skilled, but they have little use for their talent. The ordinary mechanic—carpenter, mason or machinist—can and does read plans and complicated drawings with ease and accuracy but the miner is under no such necessity. He may see a map hanging in the foreman's office as he goes to his work for the first time. He probably does not examine it, and in most cases would not understand it if he did.

If in any special plan provided there is any degree of complication such as the laying out of a curve or the hanging of a trolley wire many a foreman would look at the "picture" more or less askance and would wonder what it all meant. To the miner it would be even more of an enigma.

The man in the heading or room merely drives in the direction of the sights and sometimes has the incidence of these marked on the face for him by a man specially appointed. He makes the room so many "shovels" wide and he lays the track—if he does lay it—with a simple gage. He does not even attempt to make a smooth rib as the early, careful, but often wholly illiterate, miners from Great Britain used to do with such marvelous precision in the early days of our coal industry. Of art and science the ordinary miner of today has none.

Many a carpenter, mason or mechanic can handle his T-square, triangle and ruling pen, can design a building and then erect it. His ideas of architectural beauty may be feeble, but his building usually suits the needs and even the ideals of his clients. Too much has been written of the skill of the miner. All that can be said of many of them is that after much instruction they cannot even set a prop when it is needed, bring down the coal without creating an excess of slack, or load a hole in a safe and lawful manner. Many are not even desirous of being skillful.

## The Power of Sentiment

IT IS ALMOST amazing to what an extent the everyday life of most human beings is controlled, dominated and governed by sentiment and habit. Just as the honey-laden bee yearns for its hive, just as the carrier pigeon turns unerringly toward its beloved dovecote, just as the heart of the Scot longs for the heather covered hills of native Scotia, so the soul of the ordinary individual, consciously or unconsciously, delights in the environment of its accustomed habitat and the memories of the days that are gone. Every coal company opening a new mine in a new field suffers from this cause and for years the labor turnover is unusually high.

Not long ago a certain coal concern opened an isolated mine in the Middle West, drawing at least the nucleus of its labor force from some of its older operations. Everything looked propitious. Natural conditions were favorable; the housing and educational facilities provided, far exceeded those available at the older plant. After a year or two of operation, however, it was found that one by one the men had drifted back to the place from whence they came, in many, if not most, instances there accepting positions and wages materially inferior to those available at the newer development.

Reason for this exodus was carefully sought, but for a long time without avail. At length an old miner solved the mystery when he remarked—"You ain't got no cemetery here."

In the sense in which this man used it, the word "cemetery" means something more than merely a suitable place for the interment of the dead—he meant also the traditions and memories that hover around the locality where acquaintances and loved ones have been laid to rest and the prospect, dear to every human, that when his own time shall come, he also may be laid away "with the bones of his fathers."

From the business standpoint, this difficulty of the coal producer is hard to surmount. Any suitable piece of ground may be set apart, designated and dedicated as a burial place, but it takes more than this to make a cemetery. In the sense in which the old miner used the word, a real cemetery can only be attained when time and the memory of those there interred shall have cast a halo of sentiment about the entire locality.

# Edgewater Mine Produces Large Output of Washed Coal Under Adverse Conditions

## Local Faults Divide Workings Into Sections at Different Levels—Electrification Is Complete Except for Hoisting—Steam-Driven Stand-bys Are Kept Ready for Emergencies

**By Robert Hamilton**

Consulting Engineer, Tennessee Coal, Iron & R.R. Co.,
Birmingham, Ala.

NEAR THE LOWER end of the Warrior coal basin in Alabama lies the Edgewater mine of the Tennessee Coal, Iron & R.R. Co. This operation produces more than a million tons of washed coal annually from a single seam so faulted that coal is mined on three levels and hauled to one main shaft for skip hoisting. These natural conditions divide the mine into sections and contribute to the difficulty of getting out coal, but sound methods, good equipment and close supervision have combined to raise extraction to 95 per cent. The performance of the mine and the substantiality of construction on the property and about the Edgewater community make the operation one of Alabama's striking coal properties.

Edgewater is approximately 12 miles west of Birmingham and three from Ensley where the chief furnaces and mills of the company are located. An interworks railroad connects this and the various other mines of the company with its industrial works including the byproduct ovens where most of the mine product is made into coke.

At this mine the coal measure worked is the Pratt seam well known for its excellent coking qualities. An average section of this measure would be about as follows: Top, sandstone or slate, coal 6-in., slate 2-in., coal 44-in., slate 6-in., coal 11-in., bottom, hard clay. The total height of this bed is thus 69 in., of which 61 in. is clean coal with 8 in. of slate and parting.

Six thousand acres lie tributary to this mine in which after 13 years of operation there remains 36,000,000 tons yet to be recovered. This mine is divided into three sections, separated by faults, near one of which (the Camp Branch) the hoisting shaft is located. Here the dislocation amounts to 147 ft., a rock tunnel connecting the shaft to the workings on the upper level. On the main east entry another rock tunnel is driven to the lowest level, the dislocation at this point being 55 ft. A small, double-drum, motor-driven hoist hauls the coal through this tunnel to a side track on the main east lower level.

Dislocation in the fault passing near the shaft amounts to nothing at the southern barrier pillar. From this point in a distance of 6,000 ft., it gradually increases to 172 ft. In the next 8,000 ft. the average throw amounts to about 100 ft. At this point this fault subdivides into five separate dislocations and disappears entirely within the next 1,000 ft.

Such faults not only change the vertical location of the coal but in many instances alter the line of dip. Thus the first south entry on the upper level slopes ½ per cent to the southward, whereas the main south entry on the lower level rises 1 per cent to the south.

All workings are on the room-and-pillar plan with entries either singe or double as local conditions may dictate. Rooms are driven 35 ft. wide and double tracked. The width of pillars is determined by the depth of the coal; when this is not more than 350 ft. first working must not exceed 50 per cent of the total area. As greater depth is attained the size of the pillars is increased to carry the additional burden and permit removal of the pillars without loss. It is the general practice to draw both room and entry pillars retreating as soon as room work is completed.

Electric undercutters are employed on all room and

---

The headpiece shows a general view of the upperworks at the Edgewater mine. The valley of the stream that runs past this plant is more or less subject to overflow so that all dwellings must be placed on higher ground. None of them, therefore, appears in this view.

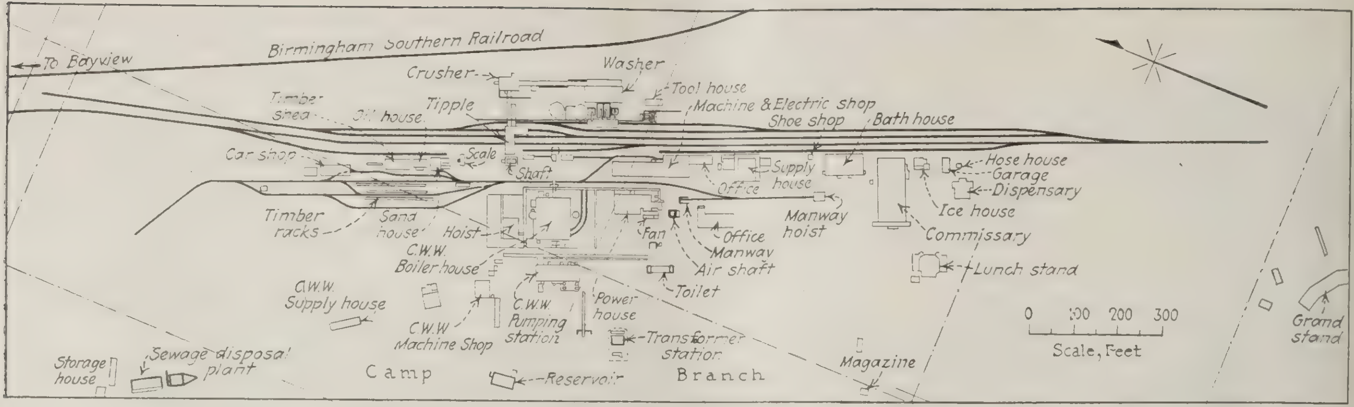

**Fig. 1—General Layout of Edgewater Surface Plant**

This shows the arrangement of buildings railroad tracks and the like. It will be noted that the shaft is on one side of the tracks and the washery on the other. While the boiler plant and pumping station are not considered as forming a part of the mine plant yet steam is furnished for operation of the main hoist.

entry work and, when roof conditions will permit, on pillar drawing as well. Timbers in rooms are set in rows 4 ft. apart each way and must be kept within 4 ft. of the working face. All mining machines are equipped with spraying heads and before the coal is shot the entire face is wet down with a garden hose by men employed for that purpose.

Inherent moisture in this coal normally amounts to 3.33 per cent. Samples taken daily for a month after the coal was crushed preparatory to washing showed that the spraying and wetting down of the face increased the moisture content of the entire output 1.84 per cent, making a total of 5.17 per cent.

Normally the coal is loaded and delivered on the entry by the miner. In many places, however, local grades against the loads are too steep for manual labor in which case the cars are moved to and from the face by company men who employ a small self-propelled electric crab car as shown in one of the accompanying illustrations. This machine moves along the entry and can either deliver the loads at the room necks or make them up into trips ready for the haulage locomotive.

In his work the mine foreman is assisted by a number of section foremen each of whom must hold a fire boss' certificate. Each such section foreman has about 50 men under his control. Particular care is exercised over miners who may be engaged in drawing room or entry pillars. This close supervision is responsible for a recovery amounting to fully 95 per cent. The mine foreman is provided with an underground office where he can meet the section foremen and fire bosses and from which he issues instructions. A first-aid room where, through periodic inspection, all necessary medical equipment is kept in first class condition, is also provided.

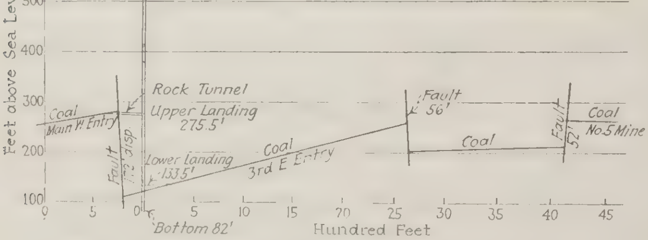

**Fig. 2—Cross-Section of Shaft and Coal Bed**

This shows how the mine is divided naturally into three sections by faults. Not only are underground operations thus cut up by nature but the pitch of the grades varies considerably because of these displacements of the measures.

Mine cars in service at this operation are of the solid body type equipped with 14-in. roller-bearing wheels. They are 8 ft. 9 in. long over all, 4 ft. 3 in. wide and weigh approximately 1,600 lb. The average load carried by these cars is 2,800 lb. and the number in service averages 1,050. The axles extend 2 in. beyond the wheel hubs and the cars are held in the revolving dump by these projecting axle ends instead of by gripping the top of the wheels as is common practice. The rings or hand holds on the ends of the cars are somewhat of an innovation. They were installed originally as a safety precaution in mines where there was but small clearance beyond car and roof. Where the miner delivers the loaded car at the entry, however, they have proven highly advantageous when crossing switches. Consequently they have been adopted generally throughout the mines of the Tennessee company.

On the lower level of this mine, eleven 8-ton electric locomotives are used, operating on 250-volt direct current at a speed of 6 m.p.h. They are equipped with 40-hp. motors. Partings are provided at suitable points from which the coal is hauled in "through" trips of 20 cars each to the side track at the shaft bottom. All loaded trips from both north and south main entries are delivered on the south side of the shaft, a runaround being provided.

On the upper level, loads are delivered to a side track on the main west entry at the second south entry. From here 20-car trips are hauled to the shaft bottom by a double-track endless-rope system. Twelve 8-ton mine locomotives are in use on this level.

At the shaft bottom all cars are uncoupled and weighed separately. Their contents are discharged in a three-compartment, gravity-operated revolving dump. Six cars may be and usually are in this dump at one time—two loads and four empties. One-third of a revolution is sufficient to dump a pair of loads. Coal from the dump enters an equalizing bin of approximately 40 tons capacity from which it moves by gravity to a measuring bin of 6 tons capacity or sufficient to fill one skip. Movement of the coal from bin to skip is controlled by two hydraulically-operated gates. These in turn are controlled by a 4-way valve which insures closure of the upper gate before the lower one can be opened. A small winch is provided for manipulating these gates by hand in case of emergency. This is rarely called into use, however. One man loads the skips and does all signaling to the hoist engineer.

Arrangements on the upper level are similar to those on the lower except that an additional kickback and car haul are necessary to control the movement of the empties. On Aug. 10, 1922, 6,200 tons were hoisted in two shifts. Of this total, 3,722 tons were produced on the day turn and 2,478 tons on the night shift. These are averages of 414 and 275 tons per hour, respectively.

All mine tracks are laid to 36-in. gage. All main entries are furnished with 60-lb. rails supported by steel tie plates and laid on 5 x 6-in. creosoted pine ties. No. 4 reinforced manganese steel frogs and weighted switches are employed generally on all turnouts except those in the vicinity of the shaft bottom where a few No. 6 frogs are used. Entry track is graded carefully and ample clearance provided on one side for the passage of employees.

Room entries are laid with 40-lb. steel rail on 5 x 6-in. untreated ties protected by steel tie plates. On room turnouts No. 2 plate frogs are used. Room entry track is only graded where local dips are encountered and natural grades are too heavy for economical operation. Rooms are double tracked with 16-lb. rail.

So far as possible this mine is ventilated on the split system. In extensive workings such as these, where the coal is produced at points a long distance from the shaft bottom, it is customary for the sake of safety to drive rock tunnels to the surface which serve as escapeways. As a rule these are 7 x 12 ft. in cross-section and are driven on a 30-deg. pitch.

Three such escapeways are available from the upper level of this mine. One is located at the third south entry off the main west entry, one is near the fifth north entry while the third is known as No. 8 escapeway and is located at the extreme southern end of the workings. An opening is also provided through the barrier pillar to the Bay View mine. This is located at the face of the second north entry and serves both operations. Under all conditions this opening is sealed.

To accomplish this seal two concrete partitions have been built, each 6 ft. thick. They are located 6 ft. apart. In each an opening 24-in. in diameter is left. A 3-in. shaft with four steel disks keyed to it, that is, one disk on each side of each partition, passes through both concrete walls. Two-foot circular openings are provided in each disk and the disks arranged in pairs, that is the openings in the two disks on opposite sides of each bulkhead are in line with each other but at an angle of 180 deg. with the openings in the other pair. As all disks are keyed rigidly to a common shaft they all turn together. This arrangement assures closure of the opening through the seal at all times yet permits the ready passage of men.

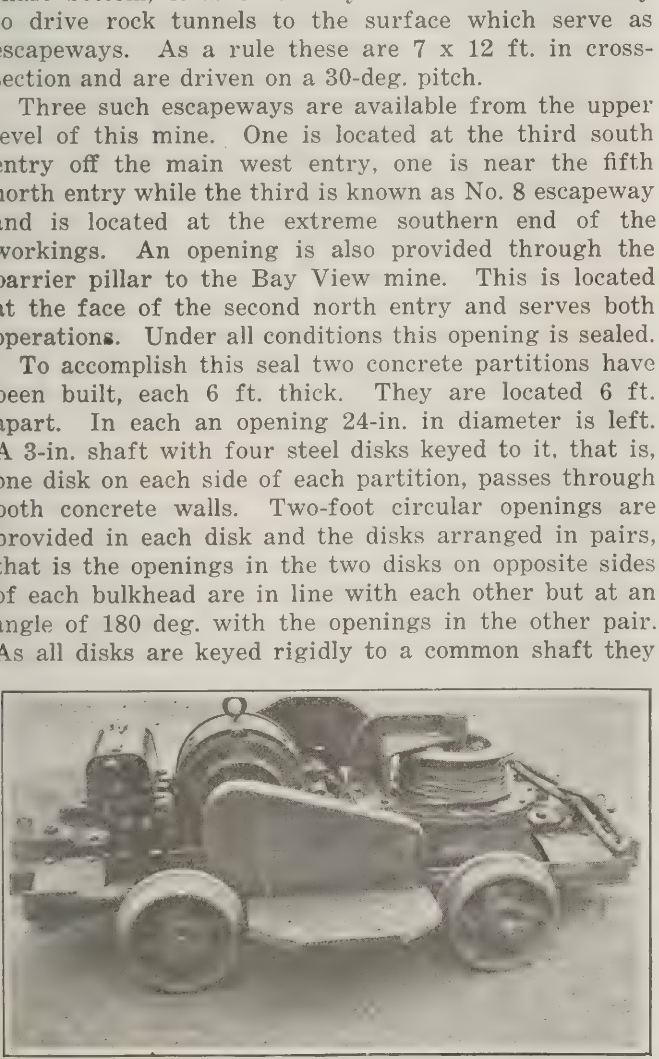

Fig. 3—Electrically Driven Crab Car

Were grades in the rooms are too steep for the cars to be moved by hand this crab is employed. The cable may either pull its load direct or it may be led around guide blocks or sheaves.

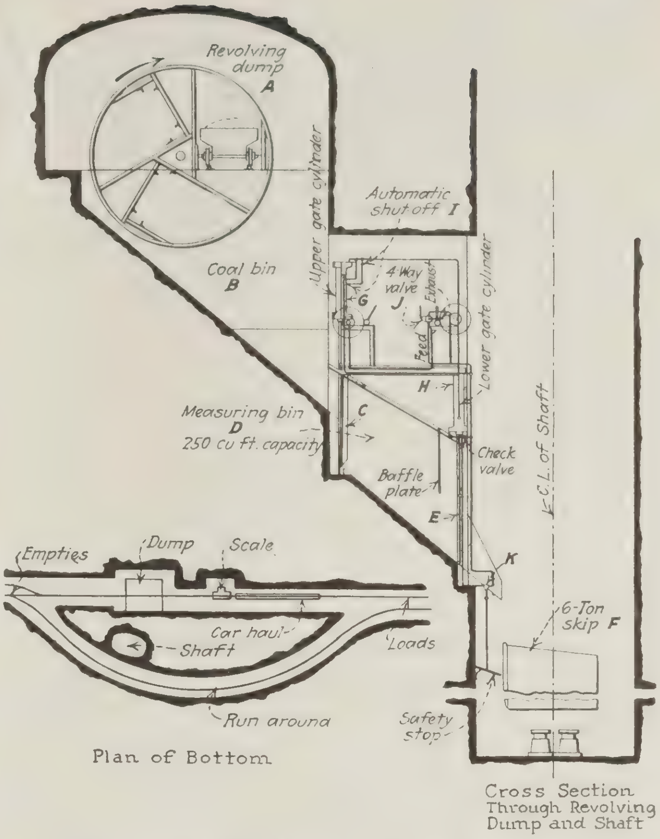

Fig. 4—Section Through Dump, Bin and Shaft

From the dump the coal slides into the measuring bin and thence into the skip. Inasmuch as all lump coal is crushed before going to the washery no particular pains are taken to prevent degradation.

The ventilating fan serving the upper level is located on the third south entry escapeway 4,500 ft. southwest of the shaft. It is of the half-casing, double-inlet, reversible type, 8 ft. in diameter and 3 ft. 6 in. wide. It now produces 120,000 cu.ft. of air per minute against a 4-in. water gage. This machine normally is belted to a 125-hp. motor. A second machine of like size but operated on direct current is held in reserve and may be started up at any time. As originally installed, both these machines were operated on alternating current—one motor on 60 and the other on 25 cycles. This arrangement did not prove entirely satisfactory inasmuch as during heavy electrical storms both lines would be disabled with the result that the mine would be closed down for days.

In order to forestall this contingency the size of the 250-volt main feeder line was somewhat increased and a direct current motor installed. A 400-kw., 250-volt, steam driven generator is kept under steam at all times ready for any emergency.

Intakes for the upper level are the escapeway near the fifth north and the manway near the main shaft.

An 18 x 7-ft. Guibal type of fan ventilates the lower level. This machine originally was driven by steam but is now belt-connected to two 150-hp. motors, one a 60-cycle a.c. and the other a 250-volt d.c. machine. It is installed at the air shaft, a short distance from the main hoisting shaft and now produces 110,000 cu.ft. of air per minute against a 3.4-in. water gage.

Fig. 5 shows the type of air crossing or overcast that has been adopted as standard by this company.

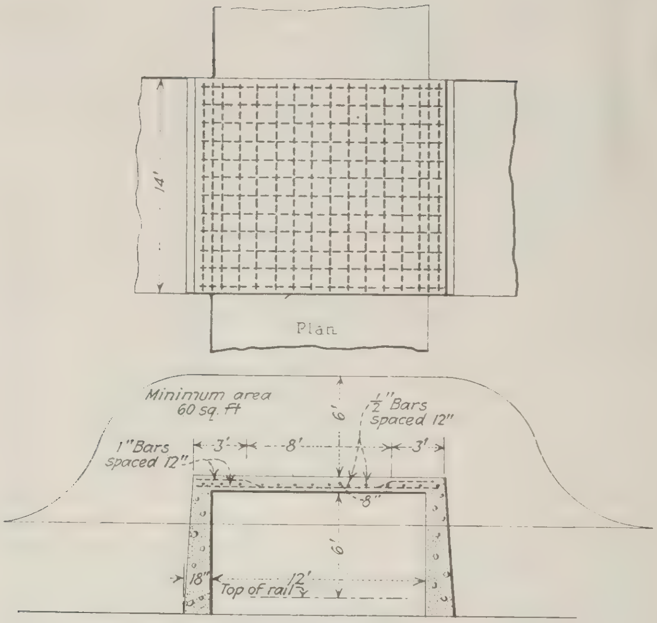

**Fig. 5—Plan and Section of an Overcast**

This design of overcast has been made standard in this company's mines. The sides or walls are of plain and the top of reinforced concrete. This makes a finished job that is both permanent and efficient.

All mine doors are built to standard size and installed in duplicate. All haulage roads are sprayed throughout their entire length at least every other day. Air samples are taken in each return at least weekly and tested for methane. Intakes for the lower level are the main shaft and the escapeway at the second north entry approximately one mile north of the main shaft.

The main pumping station is located on the lower level near the main shaft. The equipment consists of two centrifugal pumps of 2,500-gal. per minute capacity, direct connected to 400-hp., 2,300-volt, alternating-current motors operating at 1,200 r.p.m.; also two 6 x 18-in. triplex plunger pumps backgeared to 40-hp. direct-current motors. These latter machines supply the coal washery, the spray lines and the bin gate operating mechanism at the shaft bottom. Fifteen small gathering pumps are scattered throughout the mine at points where gravity drainage cannot be obtained.

During 1924, 445,000,000 gal. of water was pumped from this mine. This is equal to approximately 12 per cent of the total precipitation over the working area. It amounts to an average of 1.6 tons of water per ton of coal produced.

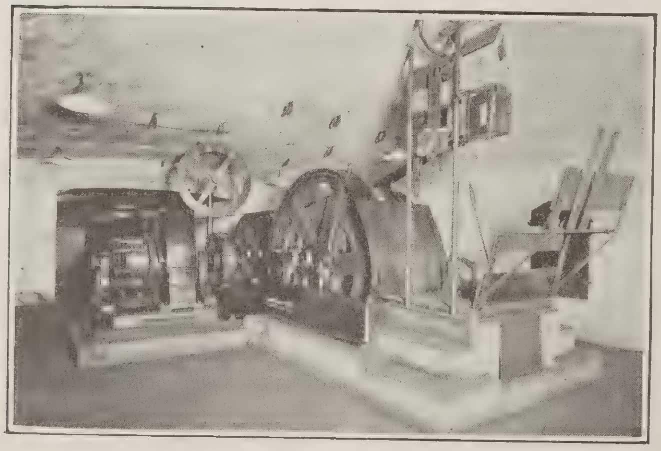

**Fig. 6—Endless Rope Hoist Underground**

This machine hauls the cars in trips up the pitch of the upper level to the shaft or to a point from which they will gravitate to the shaft.

The main shaft is of oval cross-section with major and minor diameters of 21 and 12 ft. respectively. It is concrete lined throughout and the buntons and guides are steel H-shapes. Its depth from the surface to the upper-level skip landing is 294 ft. while to the lower-level landing it is 427 ft. The dumping point on the headframe is 73 ft. above the surface, making total hoists from upper and lower levels of 367 and 500 ft. respectively.

The self-dumping skip has a capacity of 6 tons and, when empty, weighs approximately an equal amount. The headframe is of steel construction throughout and has a total height of 102 ft. From the supply bin of approximately 40 tons capacity, the coal is fed to the shaking screens by a reciprocating plate feeder.

The screens are arranged for a normal delivery of all coal to the washing plant. When necessary, however, run-of-mine, nut and slack and hand-picked lump can be loaded onto railroad cars. The upper deck of the screen is fitted with 3-in. perforations the undersize feeding direct to the belt conveyor leading to the washery; the oversize passes over a picking table and thence either by chute to railroad cars or by conveyor to the washery. In this latter case the larger coal is placed on top of the smaller material, only one conveyor extending to the washery.

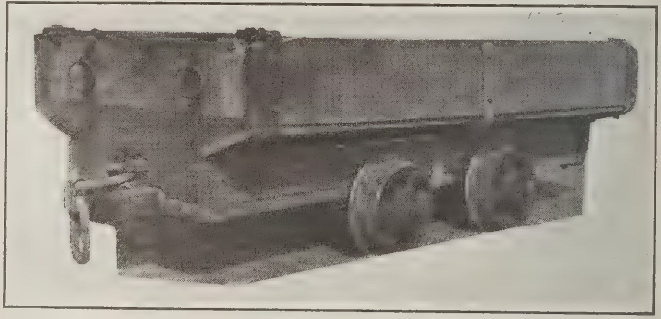

**Fig. 7—Mine Car Used at Edgewater**

Two details of this car are somewhat unusual. Two rings are attached to the solid end gates near the top. These serve as handholds and make it unnecessary for the miner to place his hands on top of the box when moving the car. The axles also project about 2 in. farther from the wheel hubs than they do in most cars. This projection furnishes a means of holding the car in the rotary dump.

The air shaft is 380 ft. south of the hoisting shaft and is sunk to the lower level with a short rock tunnel connecting it to the upper level. This shaft is circular and 11 ft. in diameter. It is concreted down to the solid rock, below which point it is devoid of all lining and all obstructions, being used for ventilation only. The concrete collar of this shaft is extended above the surface and provided with steel explosion doors. The air duct leading to the fan is below the surface and is concrete lined.

From a point near the air shaft a 7 x 12-ft. rock tunnel on a 30-deg. pitch is driven to the lower level. It is connected to the upper level by a short lateral tunnel and is used for lowering timber and other supplies. A concrete stairway separated from the track by an iron hand rail permits entrance and egress of employees. This slope is electrically lighted throughout.

At the entrance of this passage stands the checkhouse. Here record is kept of all employees entering or leaving the mine. Special checks are kept on hand ready for the use of company officials or visitors not on the mine register as no one is permitted to enter

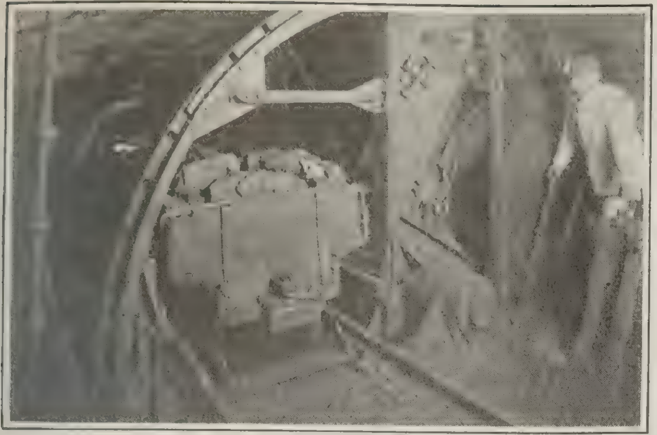

**Fig. 8—Rotary Dump in Action**

This is a three-compartment dump, a car or rather a pair of them, being accommodated in each compartment. This device is gravity-operated and always contains either four empties or four empties and two loads.

or leave the mine without a record being made of this fact.

Development of this mine was begun in 1912. In that year 115,606 tons of coal was produced. Since Jan. 1, 1913, it has been operated double-shift and the output has increased year by year until 1924, when 1,159,400 tons was brought to the surface.

At this operation the combined boiler plant and pumping station is not considered as forming a part of the mine equipment. This is because it constitutes the main water supply for all plants of the company. Steam for the main hoist, however, as well as for heating purposes, is furnished from this boiler plant.

The main hoist has 28 x 48-in. cylinders, these engines being direct-connected to the drum shaft. The drum serving the upper landing is cylindrical, 8 ft. in diameter and grooved for 1½-in. rope; that for the lower level is conical, increasing from 9 ft. 6 in. in diameter at the small end to 12 ft. 6 in. at the large end. It also is grooved for 1½-in. rope. This machine is equipped with steam reverse gear and steam brakes; it also has an automatic stop to prevent overwinding.

The hoist is housed in a suitable brick building which contains no other equipment as this might distract the hoistman's attention.

A well lighted and ventilated, slate-roofed brick power plant contains two 500-kw. motor generator sets supplying 250-volt direct current for mine use; also a 400-kw. 250-volt steam-driven direct-current generator for emergencies. This latter machine is kept under steam at all times and can be started in a few moments.

In order to reduce line losses another 500-kw. motor generator set has been installed at the second south escapeway. The underground transmission lines have sufficient capacity to permit operation of any two of these machines. Under normal conditions one of them is practically held in reserve ready for any emergency.

Fan drives occupy the southern end of the power house. Originally a steam engine drove the fan, but this has been replaced with motors and belts. The fan is now driven normally by a 150-hp., 60-cycle, alternating-current motor, with a 250-volt, direct-current machine of equal power in reserve. The repair shops are of brick with a slate roof carried on steel trusses. They include a machine shop, a blacksmith shop and an electrical repair shop. This latter is the central repair shop for all the coal mines of the company. It is well supplied with machinery for the repair of all the types of motors now in service. In the south end of this building an office is provided for the chief electrician and the superintendent of coal washeries.

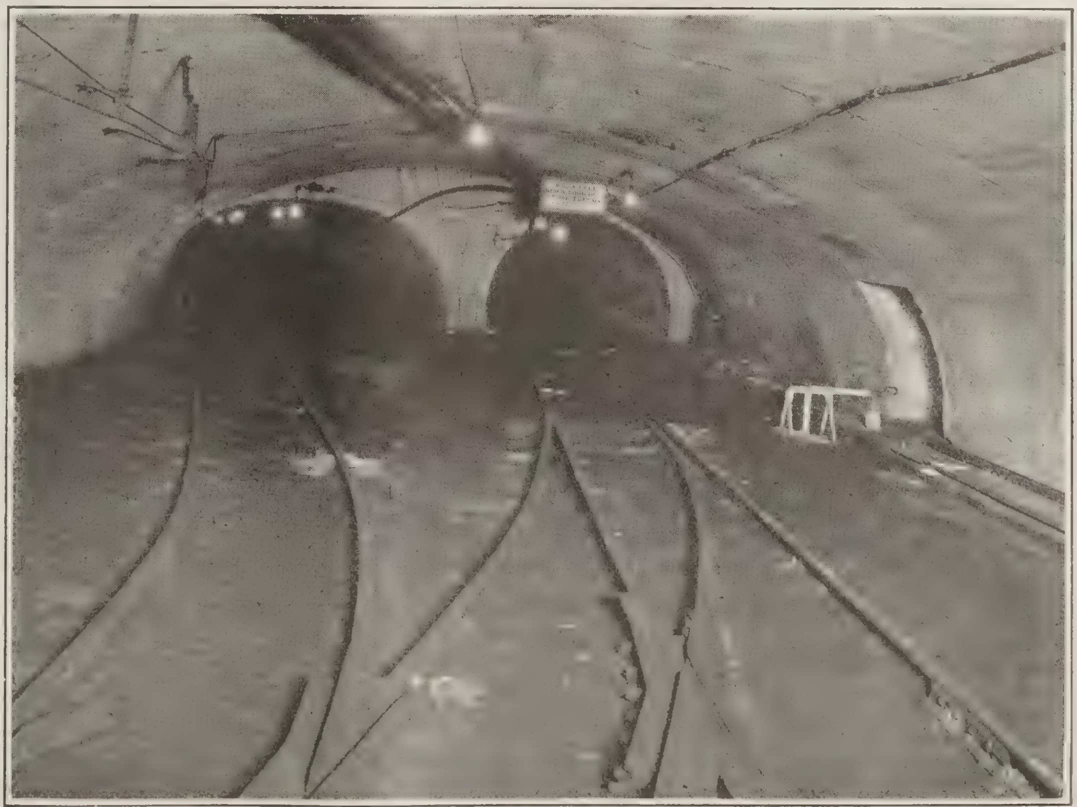
In the bath house, which is of brick with a slate roof, provision is made for 366 white and 510 colored employees. The bath and change rooms are separated by a solid wall the necessary openings in which are fitted with swinging doors.

A commissary and a lunch stand are located at the

FIG. 9

**Concrete Arching**

At the foot of the shaft the heading is well protected from all possibility of roof falls. The trackwork is also heavy and well laid. Any mishap in a place like this means a tieup of the hoisting shaft. It thus pays to make everything in the shape of tracks and roof supports solid, strong and substantial.



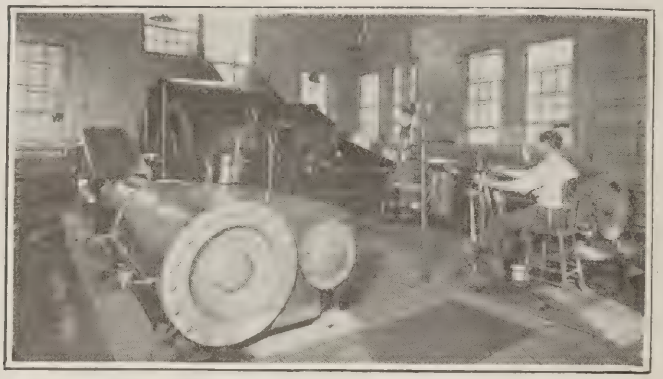


**Fig. 10—The Main Coal Hoist**

This hoist is peculiar in that it is equipped with two drums, one cylindrical and the other conical, each serving its own level. Although the electric hoist for mine use has made great progress during the past few years many operators still prefer the "old reliable" steam-driven machine.

southern entrance to the mine yard. The former has a self-service grocery and vegetable department and the latter provides lunches at all hours with special service at noon. It is liberally patronized by surface employees and others. Adjoining this building but outside the mine yard is an emergency hospital and dispensary. Here medical attention and the services of a trained nurse are available at all times.

At this mine the washery is of concrete and steel construction throughout. All settling tanks as well as the flumes under the floor are of reinforced concrete, as is also the building itself up to the floor level. All bins, tanks and the like above this point are of steel, no wood being used. The jigs are of the double plunger type with three 6-ft. cells equipped with Elmore revolving discharge valves. These machines make three products—washed coal, boiler fuel and refuse. The rated capacity of each jig is 55 tons per hour but if necessary 75 tons per hour can be effectively prepared.

The jigs are set on a concrete floor permitting ready access to all moving parts. At their tops steel operating platforms are provided upon which all electrical controls are mounted. Each jig is independently motor-driven, eliminating all pulleys, belts and shafting and permitting the operation of any machine singly or all simultaneously. As four of these machines are installed the normal capacity of the plant would be 220 tons per hour. On one occasion, however, all of these machines were operated continuously at 75 tons per hour for 18 hr., making a total washery output of 5,400 tons for this particular day, the results, so far as quality was concerned, equalling normal.

From the tipple run-of-mine coal is brought to the crusher house by a 30-in. belt conveyor. Here it is delivered to two shaking screens with 1-in. perforations. The oversize from these screens goes to the crushers and that passing the screen bypasses them to an inclined belt to which the crushed material likewise is delivered. The normal size of the crushed product is $\frac{3}{4}$ in. and under and as the oversize rarely exceeds 10 per cent it does not affect the ultimate results.

From the crusher house the coal is delivered by a 30-in. belt conveyor to the raw coal bin where it is distributed by an automatic tripper. Rotary feeders deliver this raw coal to the various jigs. The overflow from the last cell of each jig is flumed to the washed coal settling tank whence it is transferred to the washed coal bin by a dewatering elevator. In like manner the refuse is collected from the first and second valves and the first and second hutches and is delivered to the refuse bin for disposal.

Circulating water from all settling tanks overflows into the main sump. From here a centrifugal pump transfers it to the cone-shaped sludge settling tank. The overflow from this tank is collected into the main pipe that supplies the jigs. By this arrangement the wash water is used over and over again, only the make-up being added. This amounts to about 12 per cent of the weight of the coal treated. Approximately $2\frac{1}{2}$ tons of water is in circulation for each ton of coal washed. A valve in the bottom of the cone-shaped sludge tank permits the sludge to be drawn off and shipped with the washed coal.

A concrete drainage pad extends along the railroad

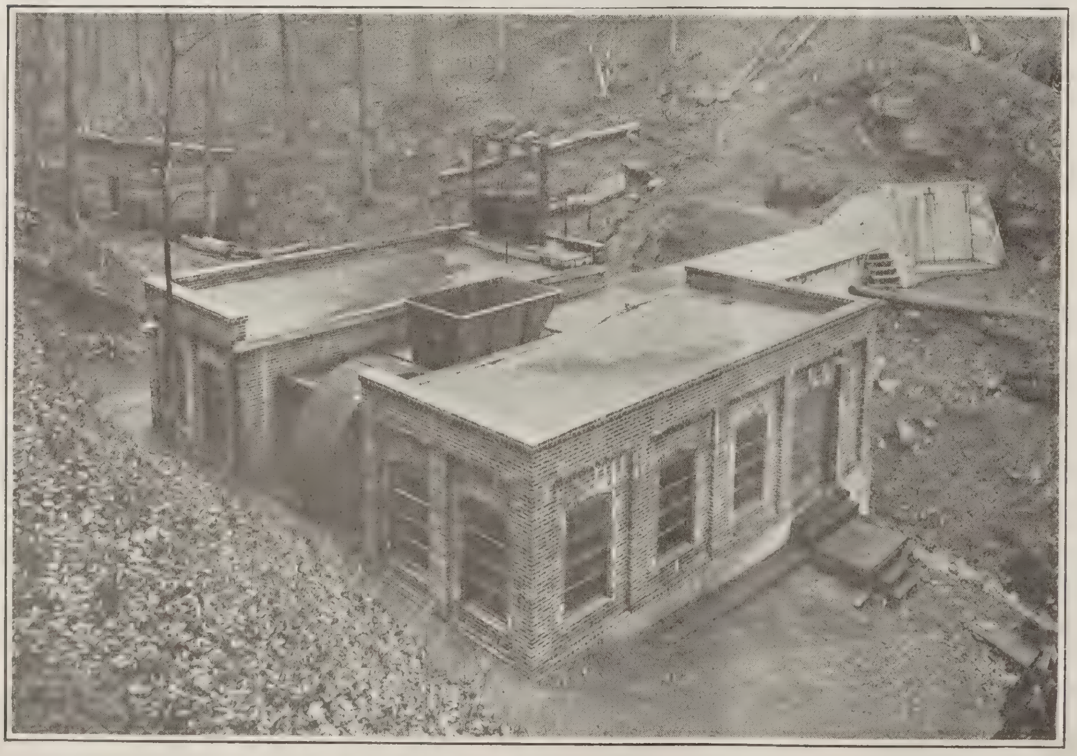

FIG. 11

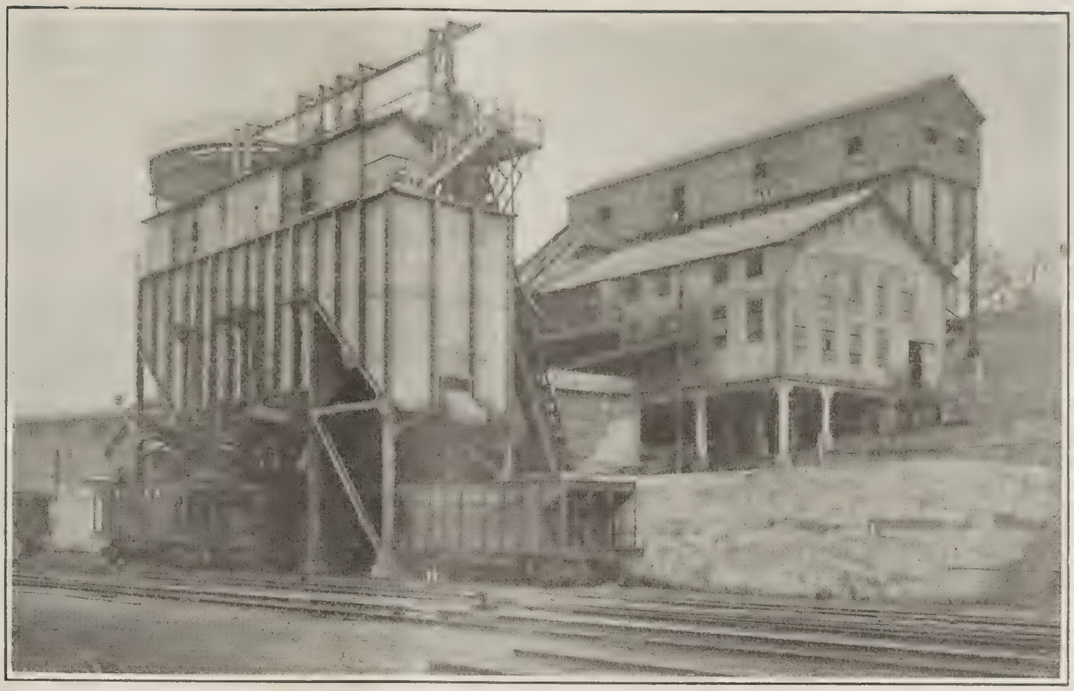
**Escapeway Fan**

Either of two motors, one upon each side, may be used to drive this fan. These two motors are of equal rated horsepower but one operates on alternating and the other on direct current. Normally the alternating-current machine, operated on purchased power drives the fan. Should accident befall either this motor or the current supply line the other motor may be promptly started.

FIG. 12

**Edgewater Washery**

This unit of the mine plant is built of concrete and steel exclusively. Because of dirt or extraneous material that cannot be separated from the coal in the mines it is necessary to wash the entire mine product. That portion that is already small enough is sent direct to the jigs; the larger pieces are crushed down to suitable size. The wash water is used over and over again only the makeup being added.



tracks from the upper end of the bins to a point some distance below the washery. All leakage and drip from either the cars or the washery is collected in a small sump from which it is recovered and returned to circulation. This pad has proven of great advantage in keeping the tracks clean as all spillage from the cars can be hose flushed into the sump and from thence elevated into the washed coal settling tank.

When this washery is in operation all jigs and settling tanks as well as the main sump are full of water. When it becomes necessary because of accident or the necessity of cleaning out any of the various pieces of apparatus, the circulating water from the sludge tank is bypassed to a washout tank provided for the purpose. When the emergency is over a valve is opened and this water returns by gravity to the main sump.

During the year 1924, in treating 1,093,633 tons of coal the following average results were obtained: Washed coal, 82.35 per cent; boiler fuel, 6.72; "clean" refuse, 10.4, and washer loss 0.53 per cent. This latter item or washery loss is the quantity of clean coal that is carried away in the refuse. It is the content of the refuse that will float in a liquid of 1.37 sp.gr.

The following table sets forth the proximate analysis of the raw and washed coal and the boiler fuel.

**Analysis of Washery Feed and Washery Products**

| | Volatile Matter Per Cent | Fixed Carbon Per Cent | Ash Per Cent | Sulphur Per Cent |
|---|---|---|---|---|
| Raw coal | 27.32 | 60.43 | 12.25 | 1.56 |
| Washed coal | 29.30 | 65.96 | 4.74 | 1.22 |
| Boiler fuel | 25.89 | 58.34 | 15.77 | 2.70 |

Float and sink tests on the washery refuse gave the following average results: Float, in liquid of 1.37 sp.gr. 5 per cent, ash content, 4.9 per cent; sink in same liquid 95 per cent, ash content 65.94 per cent.

The valley of Camp Branch in which this mine is located is rather narrow and on account of occasional floods not well suited to modern village building. All houses, therefore, are built on higher ground where conditions are suitable and ready access can be had to the plant.

The mine plant divides the village into two sections, the southern portion being occupied by white and the northern by colored employees. The same types of houses have been erected in both sections, but there is a larger proportion of two- and three-room dwellings in the colored than in the white section. All streets and alleys are graded and surfaced with chert or burned mine refuse. Ample ditches are provided to carry off heavy rainfalls. Substantial wire fences have been provided, all posts being set in concrete. Domestic water supply is obtained from the city of Birmingham, a special 8-in. line nearly four miles long bringing this water to the village. An outdoor hydrant is provided between adjacent houses. Fire hydrants are installed throughout the town and reels of fire hose and other necessary equipment located at convenient or strategic points.

Churches and schools are provided in each section of the village. Receptacles for garbage are placed in the alleys behind each dwelling and are emptied regularly by the sanitary department of the mine organization, their contents being destroyed in an incinerator. Altogether the village contains 604 dwellings, about 30 per cent of which are in the white and the remaining 70 per cent in the colored section.

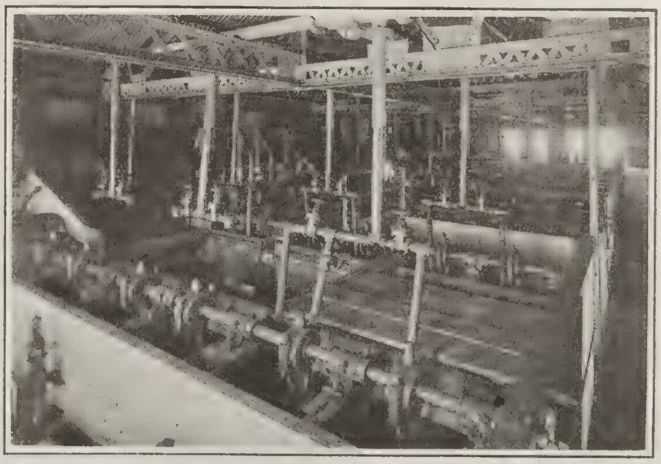


**Fig. 13—Jig Floor of the Washery**

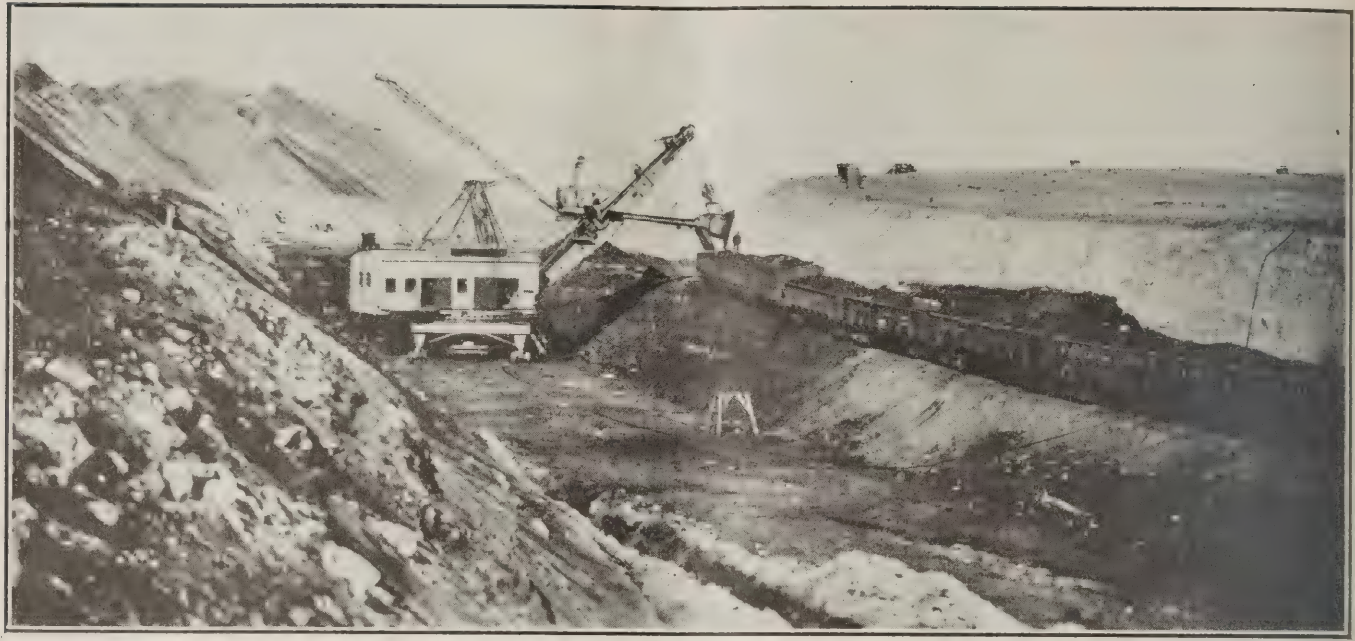
Each jig makes three distinct products—clean coal, boiler fuel and refuse. The separation is remarkably effective even though in times of emergency these machines over long periods are driven well beyond their rated capacities.



*Northern Pacific's new mine at Colstrip, Mont.*

# Colstrip Mine Is Country's First Electrified Pit

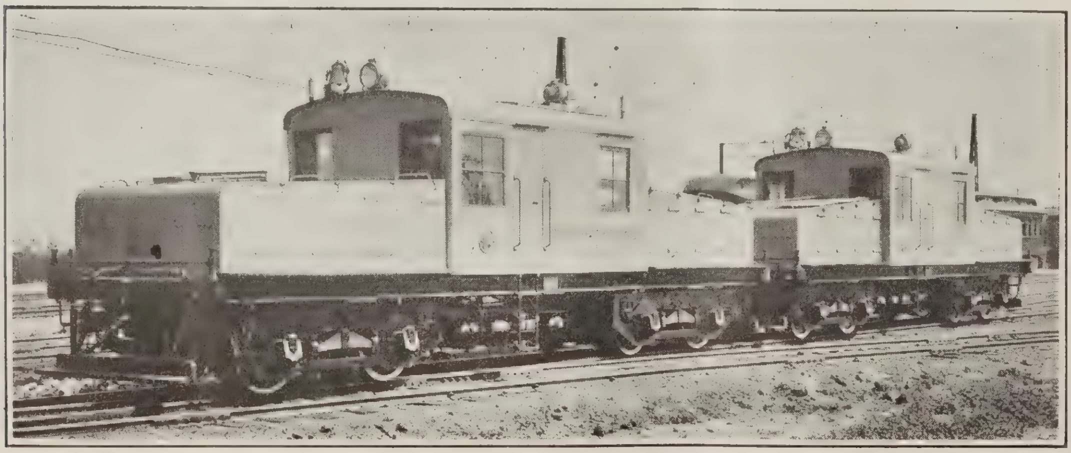
The first completely electrified open-pit coal mine in this country is at the newly-made town of Colstrip, approximately 35 miles south of Forsyth, Mont. The coal bed, about 180 acres in extent and 25 ft. deep, is owned by the Northwestern Improvement Co. and is being worked by Foley Bros., general contractors, of St. Paul, Minn. The coal is sub-bituminous with a heat content of about 11,000 B.t.u. The output of the mine will be used for the locomotives of the Northern Pacific R.R. in Montana.

As a result of a thorough study of the property, it was decided to utilize electricity in mining the coal. An extension of the Montana Power Co.'s 55,000-volt transmission line was made and complete electric equipment was purchased for stripping the overburden, mining the coal and hauling it. This equipment consists of an electric shovel, with a 155-ft. boom and 6-yd. bucket, used as a dragline excavator for stripping, equipped with Ward-Leonard control; a coal loading shovel with direct-current drive, and two 60-ton electric storage-battery locomotives. The locomotives are the largest storage-battery units in the coal fields. They are equipped with lead storage batteries of a special size and include a motor-generator set in the cab of each for charging.

During the time spent at the shovel while the cars are being loaded, a flexible cable, running from a bank of transformers on the shovel, is plugged into the locomotive for charging. While coal is mined from one strip, the overburden is removed from the next and is cast into the excavation resulting from the removal of the coal.

Many another stripping operation in older coal mining regions than this is using electric shovels both for removing cover and for loading coal into cars, but none is electrified as to haulage as completely as Colstrip. Since the fuel does not have to be put through a cleaning and sizing plant, the railroad spur is built into the pit so that coal is loaded directly into Northern Pacific cars. Trains of considerable length are handled in and out of the workings. Thus heavy motive power is necessary. The big storage battery locomotives were deemed to be the proper thing. They are successfully beginning their career of service.

Other operators of the few pits now working in the far West are watching the venture in electric mining with deep interest as, in fact, are stripping operators in other sections. The opening of the tract with the big shovels has also centered wide attention on the entire coal field in the Rosebud section of Montana.



**They're Big Fellows**

These 60-tonners now serving the completely electrified Colstrip operation of the Northern Pacific railway are the heaviest storage battery locomotives in use by any coal stripping company.

# Rosebud Field in Montana Wins New Attention

## Northern Pacific Stripping Pit at Colstrip Is Main Operation in 4,000-Square Mile Tract Producing Industrial Sub-Bituminous Fuel

By **Thomas Edwin Smith**
Forsyth, Mont.

THE Northern Pacific Ry. lately has commenced operations at Colstrip, 35 miles south of Forsyth in Rosebud County, Mont., where a bed of sub-bituminous coal 27 ft. thick is stripped and loaded by electric shovels and draglines. This operation is designed to produce eventually 5,000 tons of coal per day at a cost not to exceed 65c. per ton delivered to the railroad's main line at Forsyth. The railway has been using heretofore about 660,000 tons of coal per year from the Red Lodge mines which was costing about $3.50 per ton so the benefit of the new operation should be large.

This operation directs attention to Montana coal. That portion of the field in which lies the Colstrip tract is roughly rectangular and is approximately 90 miles long and 60 miles wide with its southeast corner on the divide between Powder and Little Powder rivers on the state line. The overlap into Wyoming is more nearly triangular with the apex a few miles northeast of Casper. Over practically the entire area, one 20-ft. bed is found and in the interior of the field lie as many as 17 beds of coal 5 ft. or more thick. The field's area in Montana is roughly 4,000 square miles and in Wyoming perhaps 6,000 square miles.

Along Tongue River there are five beds more than 9 ft. in thickness. One bed 95 ft. thick has been opened up in the Wyoming portion of the field while beds of 40 and 50 ft. frequently are reported from drilled wells.

The six mines of the Sheridan Wyoming Coal Co. near Sheridan, Wyo., with a daily capacity of 10,000 tons are on one edge of this great field and the Northern Pacific stripping mine at Colstrip is on the other. There is a mine on Powder River near Broadus that is open for business all the year round and one on Tongue River near Birney that is developed to supply local trade at any time. A number of local banks, where some settler will blast out coal for his neighbors, operate during the fall and early winter months and there are a still greater number of open pits where the settlers go and strip the cover off the coal to supply their own needs.

### Railways Expect to Reap Benefits

The North & South Ry. under construction from Casper, Wyo., to Miles City, Mont., along Tongue River will traverse this field for more than 200 miles. The Chicago & Northwestern Ry. has announced the extension of its line from Belle Fourche, S. D., to Miles City, Mont., and that line will pass through about 20 miles of this coal region. The Chicago, Milwaukee & St. Paul Ry. is considering getting its fuel from there also and has already sent one party of officials to inspect the offered holdings. It is barely possible that within the next five years five railways and the Black Hills industries will get their fuel from this field at a cost of less than $1 per ton. What effect this will have upon the camps of Red Lodge, Roundup and Sheridan with their union rate of $8.39 per day remains to be seen.

**Clinker Masses Are Common in the Region**

A great deal of the coal near outcrops in the Rosebud field is burned back for a considerable distance and the territory, in spots, is full of clinker such as this surface chunk near the engineer engaged in planetable surveying.

The coal field in general is a plateau gently sloping to the northeast and crossed by two river valleys, several long creeks and numerous gullies, many of which have cut through the entire series, thus making geological examination easy. The area is characterized by a more rugged topography than the area of Cretaceous rocks which surround it. The rocks are harder and more persistent; the hills are higher, larger and have steeper sides; the coulees are longer, deeper and have steeper sides. The hard gray and buff sandstones weather out in bold relief forming long, high almost unscalable cliffs. The higher portions of the field are called mountains by the inhabitants but they are merely remnants of a former surface set off by erosion.

### Sandstone Cliffs Form Contrast

Clinker beds resist erosion better than the other rocks and form fairly level benches. Many of these terraces are farmed. Along the larger streams, erosion has isolated many clinker-capped buttes and these red and green, tree-capped mesas with gray and buff sandstone cliffs below are a pleasing contrast to the somber-colored beds outside the coal areas.

The maximum relief of the region near Colstrip is 750 ft. ranging from 2,950 ft. above sea level at the creek bottom at the north edge of the field to a maximum of 3,700 ft. at the top of the highest hill near the workings.

Drainage of the entire Montana area is into the Yellowstone River, either direct or by way of Tongue and Powder rivers and Sarpy, Armells, Rosebud, and Pumpkin creeks. The steep grade of the drainage courses renders the run-off of precipitation extremely rapid.

Climate of the area is typical of the semi-arid regions lying east of the Rocky Mountains. Summers are generally hot and dry. The nights are uniformly cool and a daily range in temperature of 65 deg. is common. Winters are only moderately cold except for a few days each winter when temperatures as low as 50 deg. below zero occur. The average winter temperature is above zero. Warm spells, during which nearly all the snow melts, occur nearly every month of the winter.

Precipitation averages 14 in. per year, coming usually at three periods: First, during May and June when about 5 in. of rain falls; second, during Septem-

**Great Beds of Coal Are Available**

This exposure on Coal Banks coulee, 5 miles south of Colstrip, where the great Northern Pacific strip is located, illustrates the character of the seam which underlies the territory.

ber and October when about the same quantity falls; third, during December and January when the greater part of the winter snow falls. There are generally several months in each year when there is no precipitation and for weeks at a time not even dew falls at night. Thus, stripping coal may not involve severe weather difficulties.

The whole coal field is a region of only slight deformation. There are slight undulations but examination of a wide area discloses a regional dip of about 25 ft. per mile to the south. The Bull Mountain geosyncline, one of the major structural features of Montana, passes through the field a few miles south of Colstrip. This is a wide gentle syncline which starts near Roundup, crosses the Yellowstone River near Custer and the Tongue River about 10 miles north of the state line. West of Colstrip a southeast plunging anticline causes the coal outcrop to widen away from the creek for about 2 miles.

The position of this field with respect to the syncline may be responsible for the relatively high degree of carbonization which characterizes this coal. David White, of the U. S. Geological Survey, in a personal communication expressed the idea "that great horizontal pressure, unrelieved by folding" has been responsible for the greater carbonization of the coals in the region of isolated mountain uplifts in Montana.

Nearly all the coals of this region have burned along the outcrop and back under cover until the fire was smothered by the weight of the overlying material caving down on it. Often the burned belt extends 10 or 15 miles back from the edge of the clinker and in one instance the nearest unburned coal is 26 miles south of the furthest outlying clinker. Burning of the thicker beds has baked and fused the overlying rocks so that they can be readily recognized in the field by the clinker masses as shown in an accompanying illustration.

The coal of this field, according to the nomenclature adopted by the U. S. Geological Survey is sub-bituminous. While it is frequently called a lignite, such a name for it is incorrect. A lignite is a brown coal showing distinct woody structure and usually containing more than 30 per cent moisture. A sub-bituminous coal is black, has conchoidal fracture, homogenous structure and contains more than 10 per cent of moisture. The coals of the Tongue River group are remarkably uniform in weight, color, composition and behavior and do not classify as lignites.

### Bureau Makes Analysis

A large number of analyses of coal from this field have been made; one by the U. S. Bureau of Mines which is given in Press Bulletin 16,925 and copied here. The coal analyzed was taken from the Lee Coal bed, in the McKay mine which is about 12 miles south of Colstrip.

| | Per Cent |
|---|---|
| Moisture | 23.95 |
| Volatile matter | 28.7 |
| Fixed carbon | 40.3 |
| Ash | 7.1 |
| Sulphur | .6 |
| B.t.u. per lb | 9,160 |
| Moisture loss by air drying | 8.4 |

A number of other analyses of this region's coal show heat values ranging from 10,643 to 12,755 B.t.u. per pound, ash content from 5.01 to 9.33 per cent and the moisture in air dried samples running from 6.2 to 7.24 per cent.

The bed being mined by the Northwestern Improvement Co. for the Northern Pacific Ry. yields a hard black coal burning to a white ash. This coal kindles readily but burns slowly except with a strong draft. It is not a good domestic fuel. In the fire pot of a heater or range the coal decrepitates rapidly and obstructs the flow of air through the fire. In a furnace, owing to the larger fire pot and stronger draft, it gives satisfaction. In a forge with a fire 6 in. deep and a strong draft it is possible to get a welding heat with it, but it is not a good smithing coal. Considerable oil readily can be distilled from it.

The Northern Pacific Ry. several years ago made a series of elaborate tests of this coal in both locomotives and stationary engines and the results were so satisfactory that it is being used now to the extent of 2,500 tons per day and the consumption is increasing steadily.

This coal slacks speedily upon exposure to the air owing to the loss of water and this slacking seriously affects the value of the coal. The rapidity and degree of slacking are intimately affected by the surrounding temperature. At 70 deg. F. a 4-in. lump of coal will crumble to pieces in 24 hr. At 55 deg. F. the same lump will last a week. At 40 deg. F. lumps of coal will remain hard and black for five weeks. At freezing temperatures and below, the coal will keep indefinitely. A thin layer of slack will form on the surface which will protect the coal underneath from the air. There is an enormous quantity of it available and its future as industrial fuel in the regions naturally tributary to this field is rosy.

# Motor of 60-Hp. Hoists 1,200 Tons of Coal Daily

## Aids West Kentucky Mine to Lower Its Hoisting Cost —Use of a Balancing Sheave Cuts Down Size of Hoist —Smaller Motor Decreases the Power Demand Charge

**By J. H. Edwards**
Associate Editor of *Coal Age*
Huntington, W. Va.

WHEN FIRE DESTROYED the tipple, headframe and hoist of the Crescent Coal Co. at Bevier, Ky., it dealt almost a death blow to a mine which long ago had passed its prime. The mine had been worked for a number of years before the Crescent company took it over in 1902. After the fire, which occurred in November, 1923, the owners of the mine took stock of their diminished coal resources and determined the maximum amount of money which they could afford to spend for new equipment to work out the remaining coal. Next in order bids were obtained for a new tipple, headframe, and electric hoist. The total bids for this equipment were much more than the allotted amount. As a result, ways and means of cutting the cost were carefully considered.

Out of this came the proposal for a change in the hoisting arrangement. The new plan, which is somewhat of a departure from the conventional method used in a double-compartment shaft with self-dumping cages, consists of mounting on the headframe, in addition to the regular head sheaves, a third sheave for balancing the dead load. Such an arrangement relieves the hoist drum and its shaft from a major part of the strain ordinarily imposed upon those parts. This method made possible the use of a smaller hoist so that the price was well within the appropriation. As a result, the installation was made and today there is being hoisted in 8 hr. with a 60-hp. motor, the regular mine production of 1,200 tons.

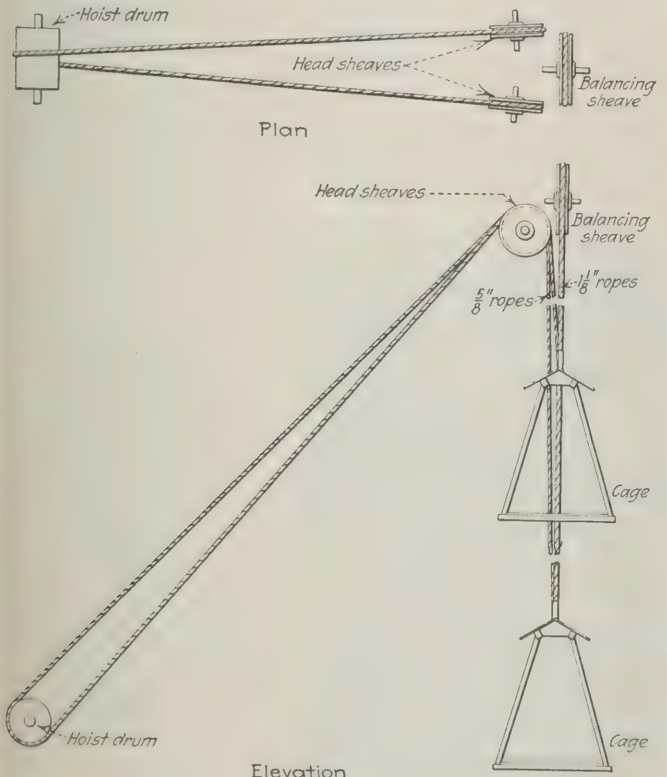


**Fig. 1—Three Sheaves Mounted on the Headframe**

The arrangement is the usual, except that the hoisting ropes are much smaller and there is added a balancing rope which is fastened to each cage and passes over a large sheave, the diameter of which is equal to the distance between centers of the shaft compartments.

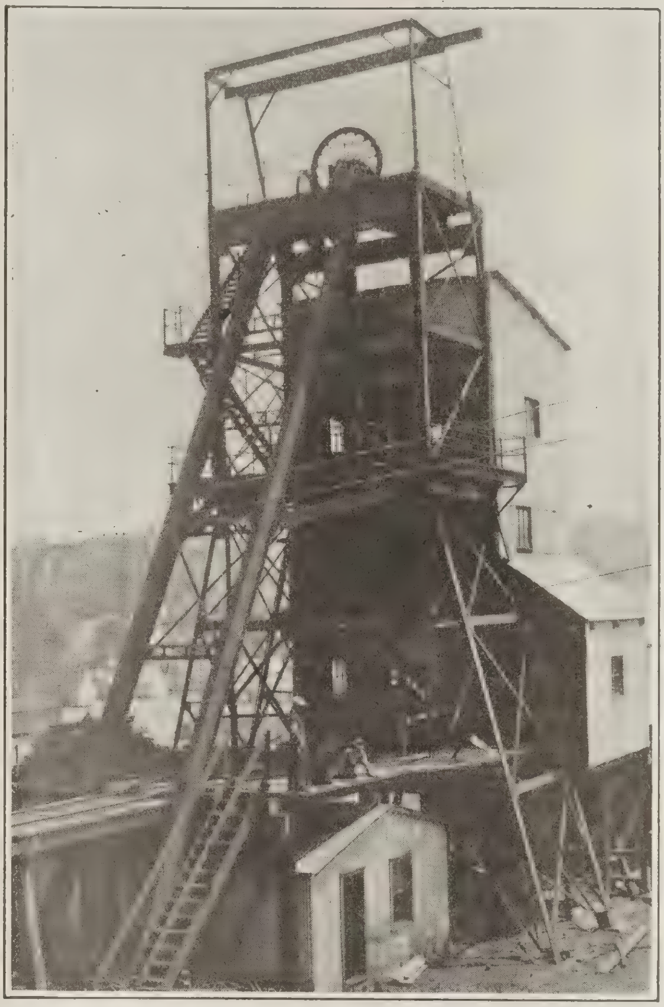

**Fig. 2—The New Tipple, Headframe, and Hoist House**

This construction replaces the equipment destroyed by fire in November, 1923. The hoist house is the small building set below the supply track. The balancer sheave is the one which shows up plainly in the center of the headframe.

The sketch, shown in Fig. 1, indicates the arrangement in use at the Crescent mine. The hoist drum is of the short, cylindrical type, and the head sheaves are mounted at such angles as to converge the ropes to the point where the hoist is installed. The balancing sheave has a diameter equal to the distance between centers of the shaft compartments. Over this sheave passes a 1⅛-in. rope, the ends of which are fastened to the cages. The hoisting ropes, which are only ⅝ in. in diameter, are carried from the drum, over the head sheaves, and are fastened, also, to the cages. Thus, there are two ropes to each cage, one 1⅛ in. and the other ⅝ in.

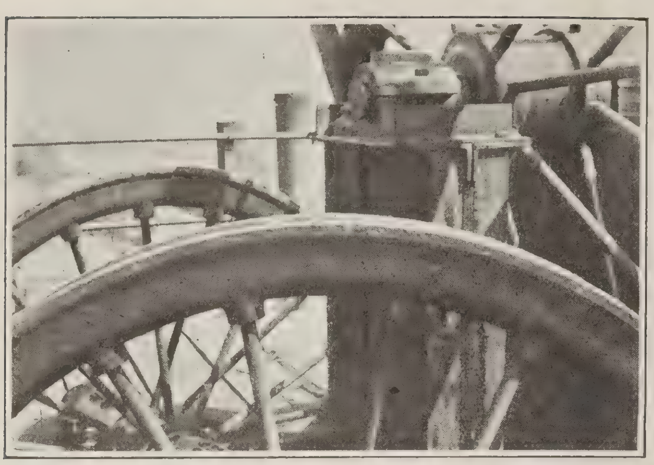

**Fig. 3—Close-Up of Balancing Sheave Mounting**

The center of the balancing sheave is mounted well above the top line of the two head sheaves. The former is 6 ft. in diameter and the others 5 ft.

A better idea of the sheave arrangement may be gained from the illustration shown in Figs. 2, 3 and 4. In Fig. 2 the small building underneath the supply track is the hoist house. Although the dimensions of this building are but 16x18 ft., the floor space is ample.

The hoist, which was made by the Ottumwa Iron Works, is shown in Fig. 5. The drum is 30 in. in diameter, has a 30-in. face, and is grooved for ⅝-in. rope. The electrical equipment, which is of General Electric manufacture, consists of a 60-hp., 440-volt, 600-r.p.m. wound-rotor induction motor fitted with a solenoid brake, and a semi-magnetic controller.

The use of such a small motor necessitates explanation as to the conditions, other than the use of the balancing sheave, which makes this possible. The shaft is only slightly over 40 ft. deep and the total hoisting distance is but 85 ft. The mine cars, which are hoisted on the cages, have an average capacity of only 1.25 tons of coal.

In addition to the balancing sheave feature, the hoist at the Crescent mine is unusual, in still another way. The operator of this hoist is stationed at the dump. This arrangement eliminates one man, and is otherwise advantageous because of eliminating time lost in interchange of signals.

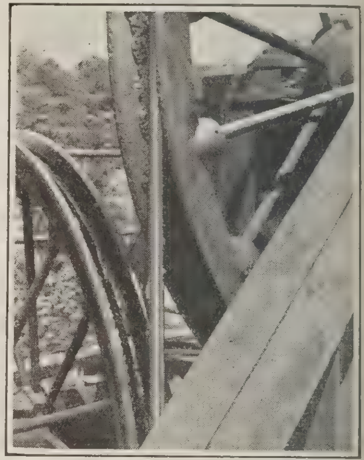
It has been found unnecessary to provide the operator with a means of applying the hand brake, which is shown in Fig. 5. The electric solenoid brake on the motor shaft, which brake is released or set as the controller handle, is moved to the first point, or to the off position, accomplishes all of the braking that is necessary. If it was desirable to use the hand brake, this could be fitted with a small steel cable for application from the operator's position at the dump.

The fact that the balancing-sheave arrangement has not been used before to any extent indicates that there must be some objections. One of these is that it is apparently impossible to protect the cage, against a broken hoist rope, by the ordinary safety-dog arrangement. Another is that the ropes must be kept closely adjusted as to length. At the Crescent mine, men are not hoisted on the cage, there being a man slope close to the tipple. This condition and that of the shallow shaft obviates, to a certain extent, the necessity for absolute safety-dog protection.

FIG. 4

**Balancing Rope**

This rope, 1⅛ in. in diameter, can be seen in the center of the illustration. It parallels the ⅝-in. hoisting ropes from the sheaves to the cages. The balancing sheave is mounted higher than the head sheaves in order that the flanges may not interfere.



The explanation of the necessity for close adjustment of rope length is, that when a cage is in the extreme dumping position none of its weight must be supported by the dump guides, otherwise this cage and

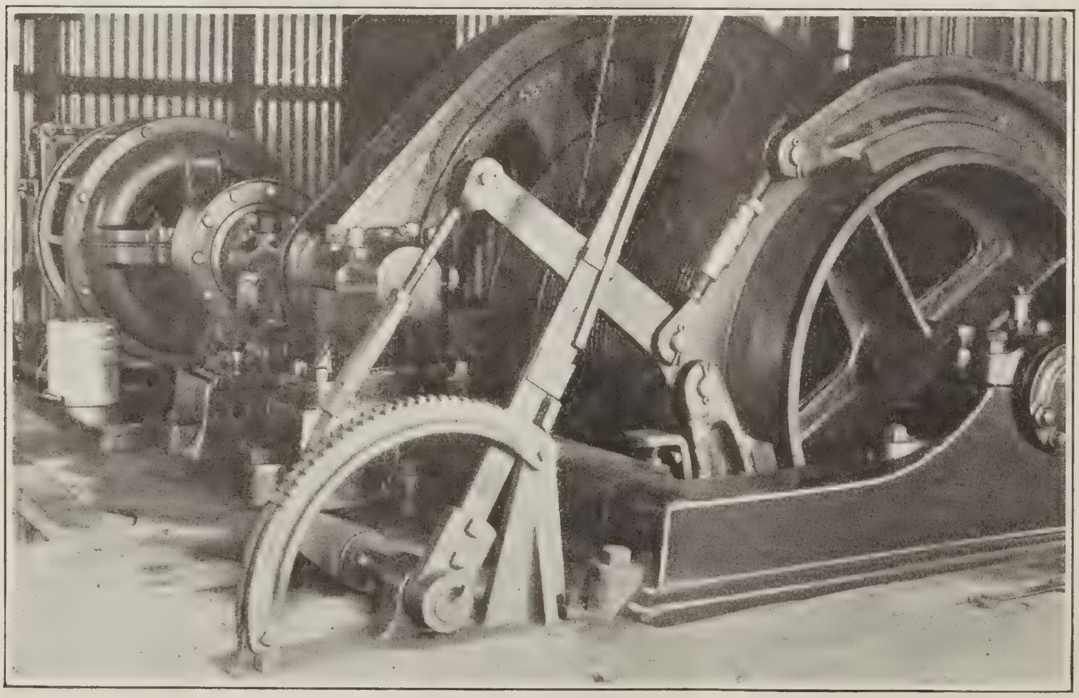


FIG. 5

**The Hoist**

An idea of the small size of the hoist and motor is indicated by a comparison to the size of the dinner pail sitting on the motor bed plate. The hoist drum is 30 in. in diameter, has a 30-in. face and is grooved for ⅝-in. rope. The hand brake in the foreground is not used. Braking is accomplished by the automatic solenoid brake seen on the far end of the motor.

empty car will not be exerting the regular balancing pull on the cage resting at the bottom. Such a condition would make it difficult, if not impossible, for the motor to start the hoist.

### Hoist Not Long In Operation

According to F. P. Wright, manager of the mine, the matter of rope adjustment is of small consequence, and should not cause delays. As to the speed of hoisting, Mr. Wright stated that the average is three trips in 80 sec., or 26⅔ sec. per trip. He also called attention to the fact that although the hoist was installed in February, 1924, it actually has been used but a few months, so has not been given a very thorough trial. The mine was shut down from April 1, 1924, to February, 1925, on account of a strike.

In addition to the great saving in initial cost, the system used at the Crescent mine effects a marked saving in the operating cost. The fact that the hoist drum and its shaft are relieved of the weight of the cage and mine car, makes it possible that these parts be of light design and, therefore, easy to accelerate. The use of a small motor effects a large saving in power demand charge, especially where the demand is based on connected horsepower, or in cases where there is a provision basing the charge on the instantaneous maximum demand. The energy portion of the power bill is also less, but the saving in this item is of little consequence.

Although it seems unreasonable to conclude that the use of a balancing sheave is new, it appears that no other installations of the kind are in use in coal mines of this country. For a mine of small to medium size with a shallow shaft the arrangement is well worth considering. It is rumored that two Illinois mines are contemplating such installations.

# Risks of Thirteen Industries Exceed that of Anthracite

## Twenty-One Groups More Hazardous than Bituminous Coal Mining—Larger Classes used in National Insurance

**By R. Dawson Hall**
Engineering Editor, *Coal Age*

IN THE classification of risks of the Associated Companies, used in Pennsylvania and in other states with percentage reductions, the classifications having listed rates are larger than in Ohio and only 222 in all. In consequence there are less industries rated as more hazardous than coal mining than in the State of Ohio, data regarding which appeared in *Coal Age,* Aug. 13.

There are thirteen industries more risky than anthracite mining and one with an equal risk (other mining than that of coal) and there are twenty-one more hazardous than bituminous coal mining and one with an equal hazard, namely, sewer construction.

In the list, however, are included barges, scows and lighters, both on the Great Lakes and on the ocean. Neither of these classifications come under the provisions of Act 455 of the laws of 1919 in Pennsylvania but that is, of course, of little importance. Omitted, however, are aircraft operation—commercial or private excluding demonstration, testing, instruction, public exhibit, trick or stunt flying—for which the compensation is $230 per annum, and aircraft operation—demonstration, testing, instruction, public exhibit, trick or stunt flying—for which the compensation is $368 per annum.

The barges, scows and lighters rate that has been taken for use in this table is the lower rate quoted and covers only such legal liability as may exist to pay workmen's compensation and liability to pay damages under the various laws of negligence as are applicable to accidents occurring as a result of these risks, this part of the coverage being limited to $5,000. No reference is made in any enumeration to fishing vessels as the coverage rates on the basis taken for barges, scows and lighters is not published, but as the unclassified fishing vessels have a higher coverage rate of $7.76 it is probable that the lower coverage rate which corresponds to that taken for barges, scows and lighters is higher than the rate for anthracite and still higher than that for bituminous mining.

In view of the extreme hazard announced for anthracite mining by John L. Lewis, as a reason for a superwage it is interesting to note how the risk appears to the calm judgment of insurance men who are backing their cold cash against that calculation. How much more convincing is the eloquence of financial investment than the oratory at the Hotel Traymore, in Atlantic City!

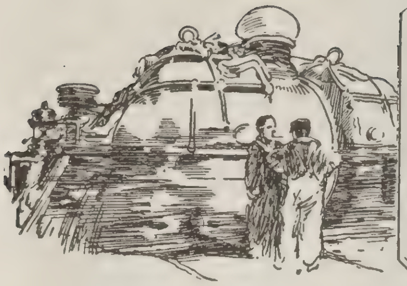
The list of occupational rates including those involving mining are as follows:

**Compensation Rates of Associated Companies In Pennsylvania, 1925**

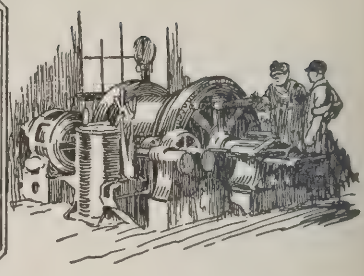
**Excluding Those for Occupations Less Hazardous Than Bituminous Coal Mining**

| | Per $100 of payroll |
|---|---|
| Explosive manufacturing, N.P.D., including fireworks manufacturing | $7.50 |
| Building wrecking, raising and moving, including dealing in second-hand materials and salvage operations, all employees | 6.00 |
| Saw mills and logging, including logging railroad, all employees, except office | 5.00 |
| Roofing, N.O.C., N.PD., with sheet-metal erection | 3.85 |
| Farm machinery operation by contractors: threshing, shredding, ensilage cutting, harvesting and hay baling, feed mill, incidental logging and portable saw mill operation, all employees, including farm and office, N.P.D. | 3.85 |
| Iron erection | 3.75 |
| Iron erection, N.P.D., tanks, gasholders, standpipes, water towers, smokestacks, chimneys | 3.75 |
| Pile driving, including timber wharf building | 3.60 |
| Junk-dealers, shop and outside, all employees, including office, N.P.D.; metal scrap, paper, rags, rubber and glass including smelting or refining of soft-metal scrap. Includes bottle dealers | 3.50 |
| Tunneling and shaft sinking, all work to completion | 3.30 |
| Fuse manufacturing, all kinds, all employees, N.P.D., including match manufacturing | 3.00 |
| Great Lakes barges, scows and lighters | 3.00 |
| Ocean-going barges, scows and lighters | 3.00 |
| Anthracite mining | 2.75 |
| Mining, not coal, all employees, except office | 2.75 |
| Quarries, not slate, including drill or stripping by contractor or operator and incidental stone crushing, cutting or polishing or lime burning including cement and clay quarries | 2.70 |
| Sand, gravel and slag excavation and crushing, no dredging, all employees except office | 2.70 |
| Amusement parks N.P.D.—all employees engaged in care, operation and maintenance, including ticket sellers and ticket collectors (includes baseball clubs) | 2.50 |
| Surface coal mining, including preliminary stripping operations by contractor or by operator, no shafts, slopes or drifts | 2.50 |
| Electric lines construction by contractors | 2.45 |
| Electric utilities operation, all employees except office | 2.45 |
| Sewer construction, all work to completion, including masonry work in connection therewith, no tunneling | 2.35 |
| Bituminous coal mining | 2.35 |
| Culm recovery, all operations N.P.D., with mining unless separate washery is operated | 1.70 |
| Coke burning, beehive | 0.65 |

N.P.D. = no division of payroll.



# Practical Pointers For Electrical And Mechanical Men



## Standard Switches and Curves Reduce Cutting and Bending of Rails

The Maryland Coal Co. has simplified its track work by avoiding as far as possible the necessity for cutting and bending rails. It lays short-radius switches and turnout curves in pillar work that are standard for the mine and can be relaid time and again without alteration.

The design of the standard switch is shown in Fig. 1. To lay the switch within the straight track *KLIA*, the rails are flared outwared at *B* and *H* respectively. The section *BD* is a straight rail which is about 10 ft. long and bevelled at *B* to match the flare *BC*. The section *DJE* is a rail which is straight from *D* to *J* and curved from *J* to *E*. If the curve *DJE* is long it may be made in two sections. The straight section *FH* to the right of the frog *F* is about 15 ft. long and is bevelled at *H* to match the flare *GH* in the rail *GHI*.

In Fig. 2 is shown a pair of standard curve rails for use in pillar sections. To lay the standard curve *GHED* from the line *GD* in the straight track *FIJA*, rails *FI* and *AJ* are torn up and the rail *ABL* is flared at *B* to take the position *ABC*. Then the curves *GH* and *BDE* are set in place. Section *GH* is a standard curve rail with a bevel point at *G* and *BDE* is straight from *B* to *D*, is curved from *D* to *E*, and is bevelpointed at *B*. Where the curves are excessively long they may be made in two sections. Generally, however, the curve is short and when laid on steel ties the two rails may be moved as one unit.

Maryland Coal Co., Elkins Read.
Lonaconing, Md. General Supt.

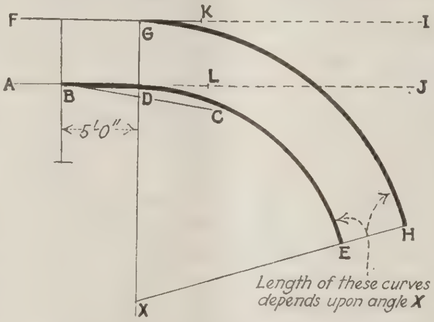


**Fig. 2—Curve for Pillar Turnout**

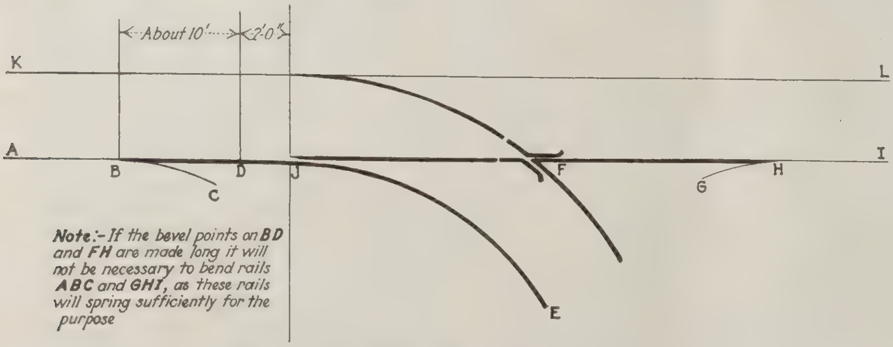
Once these turnout rails are curved they can be lifted and carried as a unit from one place to another and again relaid. In other words they are standard. The points *B* and *G* are beveled so as to provide a satisfactory lead from the straight to the curved rails.



Note:- If the bevel points on BD and FH are made long it will not be necessary to bend rails ABC and GHI, as these rails will spring sufficiently for the purpose

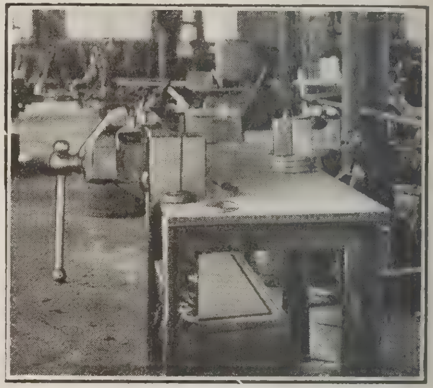
**Fig. 1—Standard Short Radius Switch**

In the Detmold mine, light rail switches are lifted and relaid as often as desired without requiring any alteration of the length or curvature of their various members nor is it found necessary to cut the straight rails of the regular track.

---

## Heavy Vise Bench Aids Mine Machinists

Machinists employed in operating the heavier machine tools found in the mine shop, such as the larger lathes, planers and the like, often have occasion to use a vise. In order to be most effective, such a vise should be of fairly large proportions and the bench to which it is attached either should be anchored to the floor or the walls of the building, or be of sufficient weight so that it cannot be readily moved by one man.



**This Bench Gets Much Use**

In the course of a normal day's work this bench is used repeatedly by the men operating the heavier machine tools such as the lathes and planers. It is not fastened to the floor in any way but its weight is sufficient to hold it in place under all ordinary circumstances. Its planed top forms an excellent surface upon which to lay out work.

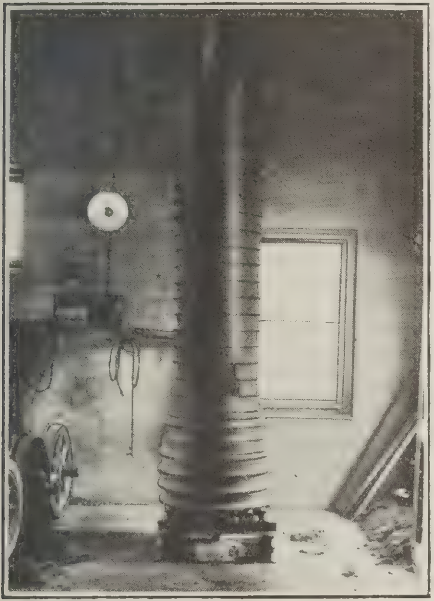
The accompanying illustration shows a heavy vise bench installed in the No. 4 mine shop of the Kingston Coal Co., Kingston, Pa. This is placed near several of the larger machine tools and is intended for use by the machinists who operate them. This bench is built entirely of iron and steel, the end brackets being of cast iron, while the top is a hard steel plate.

The end brackets on this bench were cast in a local foundry. The bench top was originally the cover plate of a coal pulverizer. When used for this purpose it was curved, but for the new use it was straightened out and planed true in the shop. It is now about 1 in. thick.

This vise bench is not attached to the floor in any way, but is sufficiently heavy so that one man can move it only with extreme difficulty. It, therefore, resists all ordinary efforts of the machinist in the course of his regular work. It securely holds both a 4-in. and a 6-in. vise, mounted upon opposite sides and at either end of the bench top. This bench is in frequent use.

## Tires Make a Freak Stove

A stove was constructed in the repair shop of the Warrior Coal Co. in McDowell County, W. Va., by stacking wornout locomotive tires from 6- to 10-ton mine locomotives on a grate of 20-lb. rails. The base was made up of 30-lb. rails. The door was formed by cutting out with an acetylene torch sections of two tires. The top is a piece of sheet iron in which is cut a flue opening. This stove is an ideal coal burner, having a large combustion chamber and a big radiating surface. On the coldest days it keeps comfortable the 20x50-ft. shop.



**An Odd Stove, This**

It is built of discarded locomotive tires with a base made of rail sections and a top of sheet iron. But it keeps a big shop warm.

## There are Safe—and Unsafe—Ways to Lift Armatures

All mine electricians agree that armatures should be handled with care, but there seems to be a lack of agreement as to what is "care". The man who is experienced primarily in the repairing and rewinding of armatures knows that every possible precaution should be exercised to prevent the bumping of the commutator and coils, and that no appreciable weight should be placed on these parts. One slight bump, or the application of a concentrated pressure, may later cause failure of the armature and necessitate an expensive rewinding job. The accompanying photographs which were snapped during actual armature changes in mine locomotives, illustrate the regular practice at two mines, showing an old-style method and a new and safer method of handling armatures.

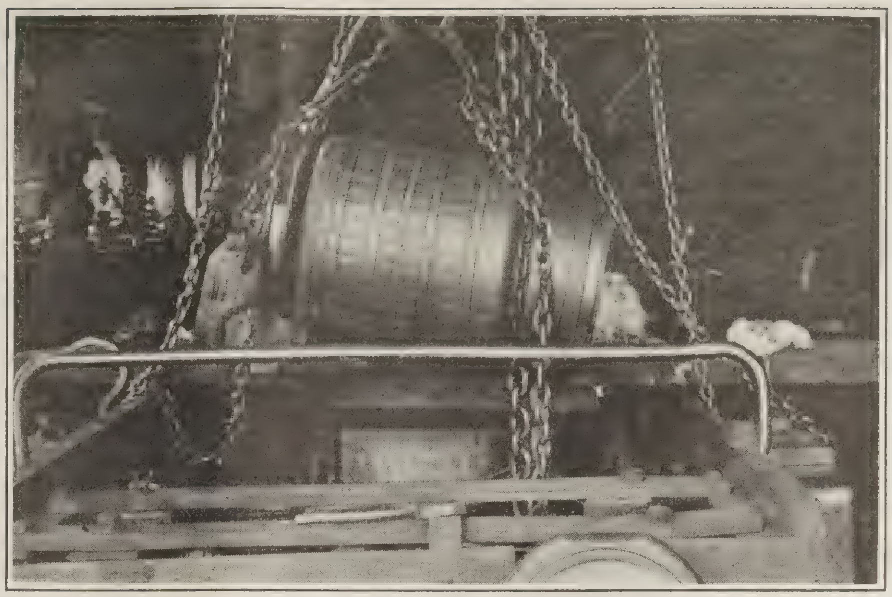


**Fig. 1—Why Take a Chance Like This?**

This armature is not a "dead one," as might be supposed from the method of handling. One end of the chain has a doubtful hold on the tapered end of the shaft, and the other end is looped around the commutator. At several points the chain is pressing tightly against the coils.

In Fig. 1 a ball-bearing armature of a 10-ton locomotive is being lifted by means of a chain sling. One end of the chain is hooked around the pinion end of the shaft in a rather insecure way and the other end is fastened around the commutator. For a portion of the circumference the chain rests on the coil connections back of the commutator, and no spreader is used to prevent the chain from pressing against their ends.

Inasmuch as the armature was to be lifted out of the bottom half of a split-frame motor, it could have been done by either of two common ways which entail no risk of damage to the coils and commutator. One is by the use of a yoke engaging with I-bolts screwed into holes tapped into the bearing housings, and the other way by means of a lifting band.

Fig. 2 shows a plain-bearing armature being taken out of a 5-ton locomotive by the use of a steel lifting band. This band is sufficiently wide to hold the armature without any extra means of balancing. The removable-end type of lifting band is necessary for easy handling of armatures of splitframe motors.

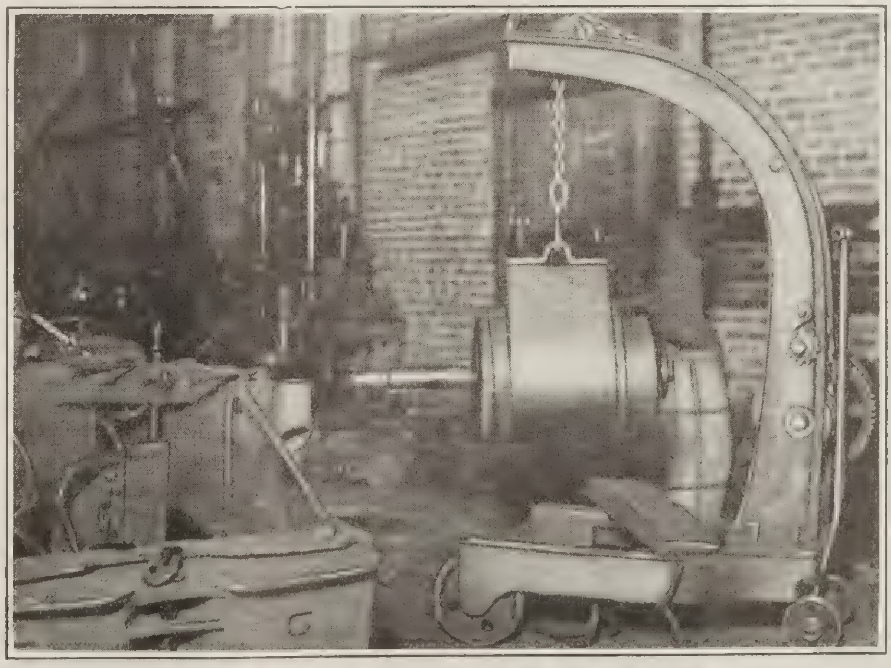

**Fig. 2—A Band Is Much Better Than a Chain Here**

This armature was just removed from the 5-ton locomotive at the left. Thin steel lifting bands with detachable end fastenings are of special advantage when removing or replacing armatures of split-frame motors. Handling an armature by means of a lifting band is but one of the approved ways commonly used.

## I. C. C. Aids Smokeless Coal to Compete With Anthracite in Northeast

### Orders Joint All-Rail Rates from West Virginia Taking Effect Oct. 15—Declines to Disturb Anthracite Rate Structure Which Miners Condemn So Loudly

**By Sydney A. Hale**

Special Contributor, *Coal Age*,
New York City

The way to more intensive competition between anthracite and semi-bituminous coals in the surviving strongholds of hard coal consumption was blasted open last week by the Interstate Commerce Commission when it ordered joint all-rail rates to the Northeast on West Virginia prepared smokeless coal. This is the outstanding feature of the decision in *Anthracite Rate Investigation*, 101 I. C. C. 363, the general inquiry instituted two years ago upon recommendation of the United States Coal Commission. That agency indorsed the persistent propaganda directed against the existing basis to the extent of suggesting a re-examination of the rate structure. The Interstate Commerce Commission now declares that it can find no ground for disturbing that structure; on the contrary, it sees good reason for letting the structure alone and contents itself with ordering the ironing out of mal-adjustments, arising, for the most part, out of its own decision of ten years ago, *Rates for Transportation of Anthracite Coal*, 35 I. C. C. 220. This will have no important effect upon anthracite rates generally.

The Commission, in setting out the results of its investigation, states that the Coal Commission left these two questions to be answered by the federal rate tribunal:

1. Can the high retail selling prices of anthracite coal be reduced through reduction of freight rates thereon which may be unreasonable or otherwise unlawful?

2. Should new rates be established for the purpose of facilitating the shipping and distribution of fuels to be used as substitutes for or to supplement domestic sizes of anthracite?

This second question, it will be recalled, was dragged into the original proceedings by an order issued November 6, 1923, "broadening the scope" of the investigation to include consideration of the rates on fuels other than anthracite to New England and Middle Atlantic states. Up to the time this second question was injected into the case, general interest in the hearings had been something less than desultory. In fact, the only real attacks made upon the anthracite rates involved complaints against mal-adjustments and a plea of the independent operating interests for a reduction in the transportation charges on steam sizes. This plea is ignored in the decision handed down last week.

As before indicated, the Commission returns a decided negative to the first question. In so doing it effectively upsets one of the most attractive apple carts which the United Mine Workers has displayed for the edification of the coal consumer who has been wondering what all the parleys at Atlantic City have been about. Messrs. Murray and Lewis, as generalissimos of the union forces in the wage scale negotiations with the anthracite operators, have insisted in conference and in the public prints that a reduction in freight rates offered a method of meeting the wage demands embodied in the Scranton tri-district convention platform without increasing the cost of coal to the consumer. In fact, they went so far in talks with the newspaper men as to hint that the freight rates were so extortionate that not only could they be slashed deep enough to cover the wage demands, but that a commission investigation would result in reductions that would also leave something for the consumer.

### Answers Second Question

The commission's answer to the second question is found in the order incorporated in the report in the case. Declaring that "freight rates effect total restraint of the shipping of coal from mines in West Virginia to points in the eleven Northeastern states north of Hagerstown, Md., and Washington, D. C.," the commission gives the respondent carriers until Oct. 15 to establish joint through all-rail rates on lump, egg and nut coal from the Pocahontas, New River, Tug River and Winding Gulf districts to stations on the New Haven, Boston & Maine and Long Island railroads; to Pennsylvania R.R. stations, Tuxedo, Md. to deliveries at New York Harbor; Baltimore & Ohio stations, Alexandria Junction, Md., to Philadelphia, Pa. The specific rate bases established are as follows:

1. To Pennsylvania R.R. stations, Tuxedo to Edgewood, Md., $3.45 per gross ton; to Perryman and Iron Hill, Md., and points intermediate, $3.70; to Newark Center, Del., and Brooklyn, N. Y., and points between said stations, rates not exceeding rates from the Clearfield district by more than $1.10.

2. To Baltimore & Ohio stations, Alexandria Junction to Van Biber, $3.45; Sewall to Barksdale, Md., $3.70; Newark, Del., to Philadelphia, Pa., $3.94.

3. To New Haven railroad stations, Portland to Chestnut Hill, Conn., Talcottville to Willimantic, Conn., North Windham, Conn., to Forest Hills, Mass., South Windham, Conn., to Oak Lawn, R. I., Attleboro, Mass., to Boston, Mass., $5.58; to other New Haven stations named in Pennsylvania R.R. tariff AA-I. C. C. No. 1800, rates not more than $1.10 per ton above Clearfield rates.

4. To Boston & Maine stations, Farley to Boston, Mass., $6.70; to other Boston & Maine points specified in Baltimore & Ohio R.R. Co. Coal & Coke Series Tariff I. C. C. No. 2523, rates not more than $1.35 in excess of those maintained by the Baltimore & Ohio from the Cumberland-Piedmont district.

### Not Dictated by Administration

The answers thus returned to the two questions raised by the Interstate Commerce Commission in considering the recommendations of the Coal Commission have caused some enthusiastic Washington correspondents to declare that the decision of last week is part of the administration program for meeting the emergency threatened by the suspension of anthracite mining on Sept. 1. If we are to construe such declarations as the expression of a belief that the President or some of his associates told the Interstate Commerce Commission how it should decide this case, then we may safely charge them to the silly summer season. Too much furore was raised a few years ago when it was hinted that another President had whispered his desires to the Commissioners to encourage the belief that such an interpretation of the decision is well-founded.

However, external evidence strongly suggests that the commission has taken something akin to judicial notice of recent developments in the anthracite trade. We may even be justified in assuming that the members of the federal rate tribunal read in the daily newspapers the statements credited to union leaders at Atlantic City in which these leaders claimed that freight rates could be cut deep enough to pay the increased wages they demand. There is a synchronization which subtly hints at this. The report in this case was submitted to the commission for decision in April, 1924. The decision was reached July 22, 1925—several days after Vice-President Philip Murray of the United Mine Workers had thundered to the high heavens because the operators declined to join the union in a petition to the commission for another investigation of rates.

The estimate of the operators that the miners' demands, if granted, would add at least $2 per ton to the cost of anthracite still stands unchallenged. The commission's decision, however, stresses the desire of the consumers for a substantial reduction in retail prices. The idea that any reduction it might order would be absorbed in higher wages finds no lodgment in any part of the opinion in this case. In the face of the miners' demand for $2 per ton, the commission declined to order a horizontal or percentage reduction which would have clipped 24 cents per gross ton off the price in Greater New York—the largest anthracite market in the country.

### Upholds Anthracite Rates

The commission finds no warrant in the present record for holding all the rates on anthracite excessive, unreasonable or otherwise unlawful. On the contrary, it is of the opinion that "a horizontal reduction of all those rates, to an extent which could be reflected in an appreciable reduction of the retail selling prices would reduce the income of the several carriers of anthracite to an extent which would impair their credit, and, consequently, their ability to perform sufficient and satisfactory transportation service for the public. The record in *Transportation and Distribution of Anthracite Coal*, 77 I. C. C. 761 (the proceedings in which northern New York and New England interests sought an embargo on movement to Canada in the winter of 1923-24) is persuasive of the conclusion that impairment of the ability of the respondent carriers to perform expeditious and sufficient transportation service in connection with the distribution of anthracite coal might subject consumers to hardships which would outweigh any benefits resulting to them from a reduction in rates."

The report of the commission gives the carriers 90 days in which to correct voluntarily a number of existing mal-adjustments, involving the failure of the railroads to equalize rates via long and short routes. The commission, passing upon the plea for equalization, plainly states that it "cannot authorize equalization through any increase of rates," but expects "the carriers to reduce the higher rates on domestic sizes and pea applicable over the longer routes to the level of the rates applicable over the shorter routes between the same points, to the end that where the carriers maintained the same level of rates to given points prior to our order in *Rates for Transportation of Anthracite Coal* that parity of rates shall be restored."

These changes, however, are only local: they will not effect or rechart the course of the general streams of distribution. The order with respect to joint through rates on semi-bituminous coal from southern West Virginia, on the other hand, promises to have a marked influence upon the distribution factors in the Northeast and the Middle Atlantic states. These states are the heaviest consumers of anthracite coal, using in recent years over 70 per cent of the domestic anthracite tonnage shipped. These states have been the least responsive to efforts to introduce competitive fuels. Even in times of shortage, there has been a disposition in New England and in the Middle Atlantic region to hold off until the last minute before turning to substitute fuels.

**D. J. Price**

Formerly engineer in charge of development work in the Bureau of Chemistry, U. S. Department of Agriculture, he has resigned to take up commercial work with the Mine Safety Appliance Co., Pittsburgh, Pa. He takes up his new work Sept. 1. During the past eleven years Mr. Price has carried on important investigations on the causes of dust explosions and means of prevention and control. In this period a number of industries, notably flour milling, have greatly reduced the risks of losses from this cause.

### Competitive Fuels Gaining

And yet, despite this ingrained preference for anthracite coal, competitive fuels have been making steady, if slow, inroads upon the market in those states. It has been estimated that fuel oil has replaced about 5,000,000 tons of hard coal—chiefly in domestic heating plants and, for the most part, in the New England and Middle Atlantic states. One New Jersey coke plant is distributing approximately 300,000 tons of by-product coke per year to former consumers of anthracite. Coke ovens in other parts of this territory are extending their markets and new by-product plants are springing up. And where the rate adjustment has made it possible and the producer has been willing to combat prejudice, semi-bituminous and bituminous coal has been making headway.

New England's bituminous and semi-bituminous coal consumption today far exceeds its anthracite demands. In 1924, for example, the anthracite receipts were 11,909,000 net tons; bituminous, 18,894,000 tons. Of course, industrial consumption accounts for the greater part of the bituminous tonnage, but not all. And that industrial consumption in many cases means business that has been lost by the small sizes of anthracite. Particularly is this true of fuel for heating large office and apartment buildings.

During the first six months of this year, bituminous tidewater shipments to New England approximated 6,256,127 net tons. Of this total, 5,251,608 tons moved over the Hampton Roads piers and 327,166 tons moved through Baltimore. By breaking down the Chinese rate wall against the all-rail movement of prepared sizes of low-volatile coal, witnesses before the commission estimated that approximately 500,000 tons per month could be put into the New England and Middle Atlantic states over all-rail routes. Under the combination rates which the commission now outlaws, the rates to New England points exceeded through rates from the Gauley district by $3.76 to $4.77 per ton. The commission, however, declined to adopt the Gauley rates as standard, holding they were depressed. But in ordering the basis it did, the commission had in mind removing situations such as the one at Boston where "the combination rates on New River coal exceed the retail selling price of that coal."

### Promotes Competition in Soft Coal

While the commission, as its second question shows, was concerned with broadening the market for substitutes for anthracite, its decision will also have the effect of intensifying competition between the various bituminous districts making a bid for the favor of New England and the Middle Atlantic states. The low-volatile regions of Pennsylvania and Maryland have long enjoyed through rates to a large majority of the points of consumption in these states and some of the producers so favored have already completed the pioneering steps in building up a domestic market. Typical of the rate basis in effect are rates of $3.09 to Newark, N. J., $4.48 to Fall River, Mass., $4.10 to Hartford, Conn., and $4.22 to Boston and Springfield, Mass.

Up to a certain point, these all-rail rates from central Pennsylvania have given the Pennsylvania producers an advantage in meeting the competition of West Virginia coal moving rail-ocean-and-rail to interior points. Now, the West Virginia smokeless fields are given an all-rail avenue, although at higher rates.

The order in the present case is limited to rates from mines producing low-volatile coal and served by the Chesapeake & Ohio, Norfolk & Western and Virginian railroads and feeders and to the prepared sizes.

If the order of the commission stands and there are signs that West Virginia is profiting from it, there will be a host of other producers clamoring at the gates in Washington for rate changes which will work to their particular benefit. The decision in *Anthracite Coal Investigation* is not the last word: it it only the beginning of the chapter.

## Engineers Seek Legislation For Water Development

The Secretary of the Interior on Aug. 12 was urged by a committee of the American Engineering Council to support legislation providing for an inventory of the water resources of the United States. A bill has been drafted by the Engineering Council which provides that such a study be made by the Geological Survey. Those who discussed the matter with Secretary Work were William McClellan, chairman of the committee; Wilbur Nelson, until recently state geologist of Tennessee but now state geologist of Virginia; Col. J. H. Finney and L. W. Wallace.

The bill, which will be introduced at the next session of Congress, provides for the carrying out of "a comprehensive plan for developing both surface and ground waters for domestic and industrial supplies, irrigation, navigation, power and other uses and for the conservation and control of flood waters." It provides for co-operation with the states to those ends and suggests that the federal government expend $500,000 annually for twenty years for its part of the work.

## *Union Officials Wounded In "Wild Cat" Strike*

An attempt by sub-district officials of the United Mine Workers to protest a "wild cat" strike at Zeigler, Ill., Aug. 12, resulted in a riot in which Lon Fox, president of sub-district No. 9; E. C. Cobz, vice-president of sub-district No. 9, and Hezzie Hindman, president of the West Frankfort Trades and Labor Assembly, were severely wounded. One miner was fatally injured and a score of others hurt during the rioting that came as a culmination of the three-day outlaw strike.

When the strike was called by the local union without approval of the sub-district chiefs, the Zeigler union heads were deposed by the sub-district officials. The appearance of the officials at a meeting of the strikers incited the riot. Fox and Cobz were beaten and stabbed and Hindman received a bullet wound. Three arrests have been made by the Zeigler authorities, who have the situation well in hand.

## Central Pennsylvania Output 70 per Cent Non-Union

Out of 1,000 coal mines in the central Pennsylvania bituminous field, but 400 are in operation, according to Charles O'Neill, secretary of the Central Pennsylvania Coal Producers' Association. Of these, not all are running full time and the larger number in operation are on the 1917 scale basis.

In the Black Lick region all the mines are operating union except two at Nant-y-Glo, where non-union output exceeds union. All mines on the Cambria & Indiana R.R. branch are operating non-union and in the Barnesboro region two mines have shifted to the 1917 scale. In Clearfield County practically all mines are union, while on the Tyrone division and in the Snow Shoe district on the Pennsylvania R.R. the mines are all returning to the 1917 basis. In the New York Central R.R. district all the mines east of Clearfield are non-union. In the Philipsburg district all mines at work are non-union with the exception of Winburne and Grassflat. In the Allegheny Valley, extending from Kittanning to Brady's Bend, all the mines along the Pennsylvania R.R. are working on the 1917 scale, and the same is true of all the mines on the Pittsburgh & Shawmut R.R. The district is producing 50 per cent of its normal production, 70 per cent of this by non-union mines.

A bond issue is being floated by the West Virginia-Pittsburgh Coal Co., of Brooke County, W. Va., in the amount of $850,000. The treasurer of the company makes the statement that the property is valued at $2,606,602. Net earnings of the company available for depreciation, depletion, interest and federal taxes for the five years ended Dec. 31, 1924, have averaged $252,500, or two and one-half times the total annual interest and sinking-fund requirements.

## Business Publishers Unite In Export Field

Establishment of the Business Publishers International Corporation to meet more adequately the demand for specialized business publications in the fields of overseas trade and industry was announced Saturday, Aug. 15, by the McGraw-Hill Company and the United Publishers Corporation. They jointly will control the new organization.

Three publications already in existence form the nucleus of the new company, which will maintain editorial and business representatives in the important commercial centers abroad. The papers are *Ingeniería Internacional* (International Engineering), a McGraw-Hill industrial and engineering monthly circulating in Spain and Latin America; *El Automovil Americano* and *The American Automobile* (Overseas Edition) in Australia, New Zealand, South Africa, India, Great Britain, Norway, Denmark, Holland, Belgium, in the Orient and other territories.

The new corporation is headed by Mason Britton, president. He is vice-president of the McGraw-Hill Company. John Abbink, until the formation of the new publishing firm, business manager of *Ingeniería Internacional,* is vice-president and general manager. J. L. Gilbert, who was business manager of the two automotive publications, is vice-president and secretary. C. A. Musselman, president of the Chilton Class Journal Company, the automotive publications division of the United Publishers Corporation, is treasurer.

## Ohio River Too Low for Heavy Movement of Coal

Low water in the Ohio River throughout its length practically has stopped coal movement in the lower river. Four towboats with 40,000 tons of coal moved as far south as Cincinnati, O., on an artificial rise in the Ohio, arriving at the Queen City, on Aug. 8, when the artificial wave was caused by releasing water from behind dams in upper stretches of the river. Two additional tows of 20,000 tons were to come in from Portsmouth, O., on a small wave. Some of this coal is for Louisville, Ky.

## Bituminous Coal Loaded Into Vessels at Lake Erie Ports During Season to End of July

(In Net Tons)

# Though Gulf Widens Between Miners And Operators Federal Intervention Is Still Only a Remote Possibility

**By Paul Wooton**
Washington Correspondent of *Coal Age*

As the breach widens between the anthracite operators and their men and as the possibility increases that the union bituminous field may become involved indications still are that federal intervention is going to be withheld more firmly than ever before. If there be federal action it is more likely to come from Congress than from executive officials. Even Congress is slow to take a hand in an industrial dispute, but it may have an opportunity to thrust in its arm earlier than Dec. 7, as the pressure for an extra session, so that tax revision may be taken up, is becoming increasingly great.

The administration will be less inclined than even to mingle in the affairs of private business, even in the simplest rôle of counselor, since Secretary Hoover's experience with the Jacksonville agreement.

Observers in the executive departments, representing as they do the whole public, are disinclined to criticize either party to the existing controversy, but coal specialists outside the government service are frank in expressing the opinion that the mine workers are deliberately picking a quarrel. They believe Mr. Lewis' position with regard to the attendance of S. D. Warriner and W. J. Richards is untenable. There is general concurrence in the view that one party to a wage negotiation may not dictate who shall represent the other side any more than one party to a business deal may pick the men with whom they will confer.

### Hold Miners Responsible

On the other hand, those familiar with these and previous negotiations do not blame Messrs. Warriner and Richards for feeling that life is too short to expend it arguing with those who do not intend to be convinced at any cost. It is idle to speculate as to what Messrs. Warriner and Richards have in their minds. The plain fact is that the negotiations have been broken off and the mine workers have to shoulder the responsibility for the break. Nothing they can say will make the public think otherwise.

The anthracite decision of the Interstate Commerce Commission has taken the wind out of Mr. Lewis's sails in the matter of the joint application for reduced freight rates. It hardly is supposed that he will renew his proposal as it obviously would be hopeless to go before the Commission seeking a rate reduction when it just has been over the ground and has made a decision.

The decision also supports strongly the contentions of the operators that they are facing permanent loss of market. While the all-rail rate on smokeless coal is more than the water rates to seaboard and some interior points, the additional cost, however, is declared to be much more than offset by the lack of breakage which occurs when the coal is loaded in West Virginia and moves in the same car to destination in New England. If the coal goes by water with attendant handling on and off ship, a high percentage of fine coal inevitably results. More significance than heretofore is attached to efforts to establish that the bituminous contract also is involved, but it is noted that the public is not being stampeded. The Atlantic City story has been palling steadily, judging from the newspaper space accorded it.

## Gowen Mines Leased to Roberts Syndicate

A syndicate headed by Graham Roberts, of Philadelphia, has leased for twenty years the Gowen No. 1 and No. 3 collieries, which have been operated by Coxe Bros. & Co., Inc., for the past forty-five years. The lease was given by the West Buck Mountain Coal & Iron Co., owners of the land, who had invited bids from several large operators, including the former lessees.

The property consists of more than four thousand acres in Luzerne, Schuylkill and Columbia counties, at the western end of the Big Black Creek coal basin, about thirteen miles west of Hazleton, Pa. The operations produce Buck Mountain seam coal. The new operators intend to increase the annual production and operations will be started as soon as the details of the lease are completed.

Mr. Roberts has associated with himself, among others, David E. Williams, Jr., of the firm of David E. Williams & Co., miners and shippers of anthracite and bituminous coal, with headquarters in Philadelphia; S. J. Livingston, of Philadelphia, president of the Seaboard Coal Mining Co., and J. E. Altmiller, W. P. Millington and C. H. Altmiller, mining engineers, of Hazleton. The new firm will operate under the name of the Buck Mountain Coal Co.

## Roads Drop Coal Holdings

Segregation of the Lehigh Valley Railroad Co. and the Lehigh Valley Coal Co. is 76 per cent complete and "excellent progress" is being made in separating the Reading Company from its coal holdings, according to an announcement by the U. S. Department of Justice on Aug. 11. The two railroad companies were ordered by court decrees to divest themselves of all coal properties, and when the dissolution processes have been worked out, the announcement said, "there will be a complete separation of ownership, management and control between the several anthracite carriers involved and their former subsidiary coal companies."

## *Engineers Say "No" Again*

The United Mine Workers have quit trying to convince their labor-union brethren, the Brotherhood of Locomotive Engineers, that the Coal River Collieries Co. mines in West Virginia ought to get back on a union basis and work under the Jacksonville agreement. Negotiations looking toward that end have been abandoned, according to William H. Thompson, secretary of District 17, who, with Percy Tetlow, president of the District, has been in lengthy conference with President J. W. Dunigan and Sales Manager C. C. Huffman, of the coal company owned by the Brotherhood. The miners' union has been driving against the non-unionism of the Brotherhood mines ever since the late Warren S. Stone, president of the engineers' union and head of the coal company, refused to accept the Jacksonville agreement and announced his company had to operate non-union or quit. However, in spite of the coal company's recent final and absolute refusal to commit corporate suicide at the request of the United Mine Workers, Mr. Thompson said, "we cling persistently to our view that the Jacksonville wage agreement is just, right and equitable."

## Utilities Consume More Coal In June Than in May

Public utility power plants in the United States consumed 3,101,656 net tons of coal in June, according to a report by the U. S. Geological Survey. This compares with 2,965,155 tons in May, as shown by revised figures. Fuel oil consumption by utilities in June totaled 774,544 barrels, compared with 675,393 barrels in May.

The average daily production of electricity by public-utility plants in June was 173,500,000 kw.-hr.—about 3½ per cent larger than the average daily output for May.

Since the rate of output of electricity by the use of water power decreased from May to June, due to the usual seasonal decline in the flow of streams, the increase in the average daily rate of the production of electricity by the use of fuels was most pronounced. This marked increase in average daily output in June, as compared with May, may be due in part to an increase in the demand for power and in part to there being one more workday in June than in May, even though May is a 31-day month.

Sealed proposals will be opened by the Superintendent of Lighthouses, Staten Island, N. Y., at 2 p.m., Aug. 24, 1925, for approximately 1,800 tons of bituminous coal, in quantities as required from Oct. 1 to Dec. 31, 1925, delivered and trimmed into bunkers of lighthouse vessels, under coal chute at contractor's pocket, New York. Further information will be given on application.

## Lewis Calls His Soft-Coal Captains Into Conference; No Anthracite Break Yet

John L. Lewis and his chief aides in the United Mine Workers met at the Bellevue-Stratford Hotel, Philadelphia, Pa., on Monday of this week. A long, secret conference was followed by the "explanation" that the meeting had been held to discuss "ordinary union business." To add the proper fillip of mystery to the gathering it was intimated that a like explanation would be given for any subsequent conferences which might be staged during Mr. Lewis' sojourn in the City of Brotherly Love.

The fact that Van A. Bittner, chief organizer in West Virginia, and George W. Lewis, who has been watching developments in Nova Scotia, joined International Vice-President Murray and International Secretary-Treasurer Kennedy at the meeting led some observers to believe that the union leaders were mapping out a campaign for a general strike in the soft coal regions. Such a strike was hinted at by Mr. Lewis when he addressed the tri-district convention of anthracite miners several weeks ago. The hint was repeated in more threatening language later by Mr. Bittner in telegrams to Secretaries Davis and Hoover, without sweeping the Washington administration off its feet.

That the breakdown of the Jacksonville agreement in many parts of the bituminous fields is worrying union leaders is well known. The Van Bittner telegrams were an open appeal to the government to help the union whip back into line districts that had thrown off the union yoke. In some quarters it is believed that the Bourbonism shown by the union in the Atlantic City conferences with the anthracite operators was due to the bituminous situation and was part of a strategical movement to scare the government into intervening in the anthracite dispute and then to demand that it back up the United Mine Workers in the union's bituminous campaign as the price of labor's consent to intervention in anthracite.

The breach between anthracite operators and union leaders seems as wide as ever. Neither side has announced any step toward ending the deadlock created by Mr. Lewis' refusal to discuss union demands further with the Inglis committee unless assured in advance of favorable consideration. The national administration preserves its attitude of silence and the expected invitation to journey to Harrisburg has not yet arrived. Governor Fuller of Massachusetts, however, has asked his fellow New England executives to meet with him at Boston on Aug. 21. "to take definite action on the fuel situation with the object of relieving New England from its dependency on anthracite as a fuel."

## *Frick Company Fires 265 Coke Ovens*

The H. C. Frick Co. last week fired 265 coke ovens in the Connellsville (Pa.) region, of which 150 are at Hecla, 50 at Phillips and 65 at Leith. They were put in blast Tuesday morning. The putting in blast of an additional furnace at Lorain, Ohio, early in the week caused the demand for coke.

The general increase in the demand for iron, it is said, will cause more furnaces to go into blast soon and in this event the firing of more coke ovens will follow. While no official information has been forthcoming, it was said yesterday that in all probability several hundred additional ovens will be fired this or next week.

---

Within a few weeks there will be a department of the Safety Division of the U. S. Bureau of Mines to deal with electrical hazards. This will be a field service in which attention will be given to the reduction of electrical hazards, such as defective wiring and faulty installations. Limited at the outset to what is known as District G, which comprises New Mexico, Colorado and Wyoming, the work will be in charge of K. H. Marshall.

## Britons Muddle Along in Their Coal Tangle

The principal advance made during the past week in the British coal situation was that a great deal of oratory was released in Parliament during the debates about the government subvention and the formation of the Royal Commission of Inquiry which is to study all phases of England's coal problem during the winter. The Commission is not yet named. A. J. Cook and Tom Smith, miner leaders, want the miners' federation officially represented, but Prime Minister Baldwin will not agree. Mr. Cook has announced that the Reds are threatening him and that the government ought to protect labor leaders against insidious attacks.

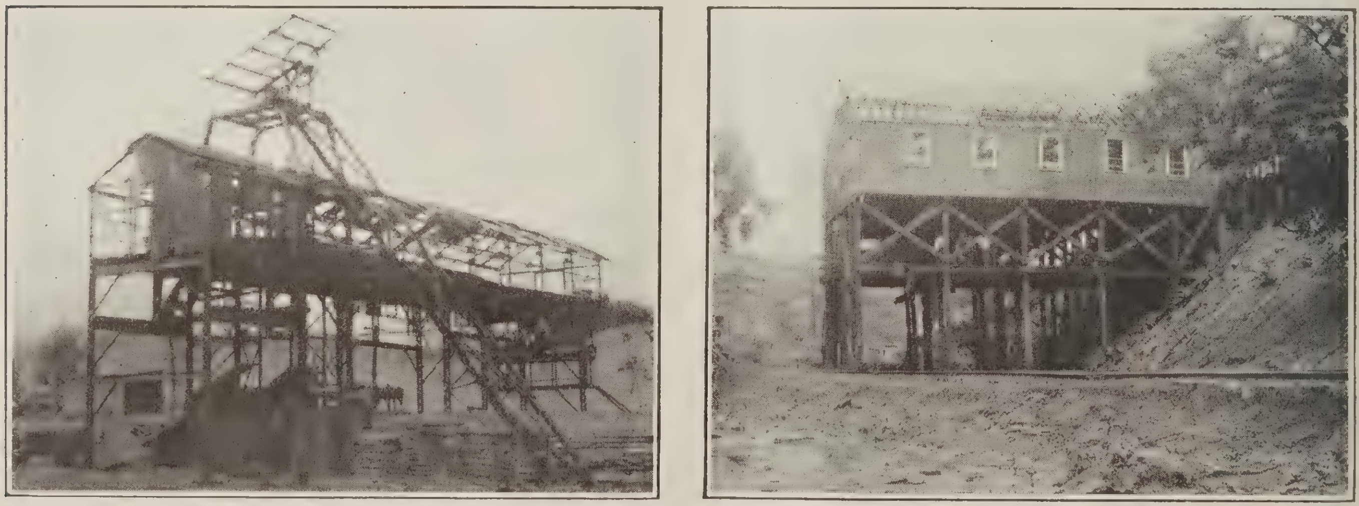
The subvention to wages of coal miners during the next nine months pending an inquiry by a Royal Commission involves the maintenance of the 87 to 13 ratio, which means wages will receive 87 per cent of the proceeds of the industry after deduction of costs other than wages. Wherever this percentage provides a sum below the 1924 minimum wages agreement, the difference will be met by a subvention to coal districts rather than to individual mines as units. Owners are guaranteed 13 per cent of the proceeds of the industry up to 15d. profit per ton, beyond which profits go to meet subvention.

## Alaska Coal Deposits Prove Unexpectedly Valuable

Development of Alaska coal mines is revealing that the deposits there are much more valuable than early prospecting indicated, according to O. P. Hood, of the Bureau of Mines, who visited the northern territory recently.

Large dredging operations which are to begin next season will provide a new outlet for Alaska coal. The dredges are to be operated electrically from a central station, which will burn coal.

Development work at the several operating properties, Mr. Hood found, has uncovered high-grade coal which has not been seriously disturbed by faulting.



**Pittsburgh Coal Co. Scraps Idle Plants**

The Pittsburgh Coal Co. is proceeding with undiminished vigor in the work of dismantling a number of plants at its less efficient and higher cost operations. The pictures show two of the tipples that are being scrapped. At the left is depicted the tipple in course of destruction at Laurel Mine No. 2, and at the right the demolition of the tipple at Beadling, Pa.

# Union Makes No Progress in Strike Zone of West Virginia—Open-Shop Tonnage Grows—One Man Beaten Up

The cause of unionism in northern West Virginia was aided by nothing that happened during the past week in that region, where mine owners and coal miners who wanted to work combined to throw the union out months ago. The tattered remaining forces of unionism, still going through the motions of a strike, are making little impression and the proportion of non-union coal mined continues to mount over the total produced at union mines. The week saw a little roughness, a great many rumors, and a near-schism within the ranks of the West Virginia Federation of Labor, dominated by coal unions.

The Federation held an election Aug. 12. C. Frank Keeney, once president of District 17, ran for the presidency of the Federation and, after getting himself nominated, withdrew from the convention with 87 delegates from Mine Workers' locals, declaring he would try to split the Federation unless the administration of it "gave the members a square deal." Finally he was mollified and returned to the convention, withdrawing his candidacy. John W. Eaton was re-elected president. Keeney has been charged with attempting to start a West Virginia miners' union independent of Indianapolis, so that a deal could be made with mine owners for operating mines at a reduced wage. The demonstration in the Federation convention indicates something of his strength within labor ranks in his state.

### Deputy Sheriff Beaten

The nearest thing to rioting in the strike district took place at Laura Lee, one of the Hutchinson Coal Co. towns, Aug. 9, when a group of striking miners beat up J. E. Bacorn, a deputy sheriff, who was suspected of being a "hired gunman" employed by the Hutchinson Coal Co. He was in a strikers' meeting and was ordered to leave. He refused and the fight followed. Van Bittner, International Representative in the strike zone, took occasion to speak about the incident, declaring that since "the high-handed Sheriff Don Chafin" of Logan County had been sentenced to serve a term in the penitentiary Chafin tactics on the part of sheriffs had been transferred to other counties.

Mr. Bittner, C. Fremont Davis, financial agent, and James McCleary, international representative, were in conference with John H. Jones of Pittsburgh, Pa., president of the Bertha Consumers Co. during the end of last week. Effort is being made to have the company resume operation at Rachel mine at Downs on a union basis. The union claims that the company has evicted some and expects to evict more union miners' families within a short time.

In the first four days of last week the non-union mines of the striking region produced 6,397 cars of coal, against 1,021 cars loaded by union mines. The peak daily non-union production in northern west Virginia was reached Aug. 13, when 1,679 cars were produced in the 12½ counties, excelling the previous daily peak of Aug. 7, when 1,622 cars were loaded. On the average there were 178 mines at work on a non-union basis in that period last week, compared to 13 union mines. The largest number of non-union mines to work any one day since April 1, was on Aug. 13, when 180 were reported active.

During last week several new production records were reached on the various divisions. On Aug. 13 a new daily non-union record was attained on the Monongahela Ry. and a third on the Charleston Division, B. & O. R.R., at 101 cars. The B. & O. Cumberland Division, mines loaded 155 cars on Aug. 12, which was also a new record.

Picketing in the region has eased up, although it breaks out in spots spasmodically. The United Mine Workers held mass meetings Aug. 16 at Jere mine in Scott's Run, Gypsy and Kingmont, points where non-union mines thrive.

The union broke into a lively advertising drive in a Fairmont newspaper last week when it attacked the American plan. They charged that non-union coal companies refused to let farmers sell produce and vegetables in the open shop mining towns. Operators say that it is propaganda. Others admit farmers are interviewed as they come in because it is necessary to have a line on who enters company property.

The strike zone of the Northern Panhandle section is quiet. According to reports, the United Mine Workers of America have invited William Green, president of the American Federation of Labor, to address a mass meeting in the latter part of September.

At a recent miners' mass meeting held at Warwood, near Wheeling, announcement was made that 200 miners employed by the Richland Coal Co. and Costantza Coal Co., both of which withdrew from the United Mine Workers of America, have asked to be reinstated. The Richland mine is in the hands of a receiver, but the Costantza mine is active.

### *Hoover in Coal Merger? No!*

Talk of the proposed gigantic merger of West Virginia, eastern Kentucky and Tennessee non-union mines continues to absorb the attention of a great many coal men the country over. One story had it that Herbert Hoover, Secretary of Commerce, had been approached with the suggestion that he head the $500,000,000 corporation-to-be and that he had "listened with interest." Mr. Hoover, in his office in Washington, said this week that he knew nothing about the reported large merger and has no thought of associating himself with any such enterprise. Another story to the effect that the Pittsburgh Coal Co. was to be one of those merged merely drew a flat denial from that concern. Questionnaries to mine owners are circulating throughout southern West Virginia, eastern Kentucky and Tennessee.

---

## Two More Pomeroy Tipples Burned; $150,000 Loss

The tipple of Stalter Essex Mine No. 1, on Thomas Fork, and that of the Blackstone Coal Co., at Rutland, two of the largest in the Pomeroy (Ohio) field, were burned at about 3 a.m. Aug. 8, causing a loss of $150,000. They were found to be afire within ten minutes of each other.

Four coal mining plants so far have been destroyed since the beginning of the labor difficulties following the resumption of the mines in the Pomeroy field on the 1917 wage scale.

The Rutland property was formerly owned and operated by the Maynard Coal Co., of Columbus, but was sold a few months ago at a receiver's sale to a company of eighty miners, who have been operating it at full capacity on a co-operative plan.

Those first to see the fire insist it was of incendiary origin. The flooring of the runway had been saturated with some inflammable fluid, which caused the blaze to mount the structure with leaps and bounds, they declared.

The Stalter Essex mine, which had not been in operation for more than a year, is owned by the same company which is operating mine No. 7 near by on the 1917 scale. Mine No. 7 is well scattered and has a strong force of guards, and it would seem impossible for an incendiary to get to it.

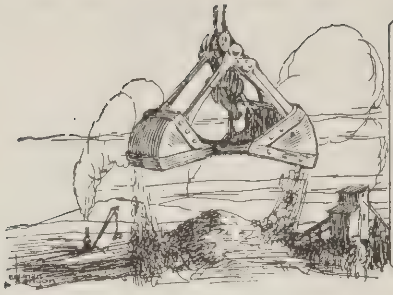
At mine No. 1 a half-burned torch consisting of a bunch of cotton waste attached to a long stick by a piece of twine was found. The waste had been saturated with oil.

Steps were taken at once by both companies to rebuild the two tipples. It is announced that both concerns will be running mine-run coal within two weeks and that shaker screens, picking tables and loading booms will be installed later.

The two fires constituted a climax to a series of mine fires and explosions in the Pomeroy mining field which has extended over a period of several months. Other acts of violence were the burning of the tipple at Stalter-Essex mine No. 5, dynamiting of a ferryboat across the Ohio River used by miners and the destruction of a power house at a mine of the Pittsburgh Coal Co. Rewards aggregating $1,800 have been offered for the arrest and conviction of the culprits.

---

The Fourth International First-Aid and Mine-Rescue Meet, to be held Sept. 10-12, at Springfield, Ill., will be financed by the miners, the entire sum, about $4,000, having been underwritten by a district mine union official. A. D. Lewis, a brother of John L. Lewis, has been named chairman of the committee on arrangements, succeeding the late Martin Bolt, who was the chief of the Department of Mines of Illinois.



# Production And the Market

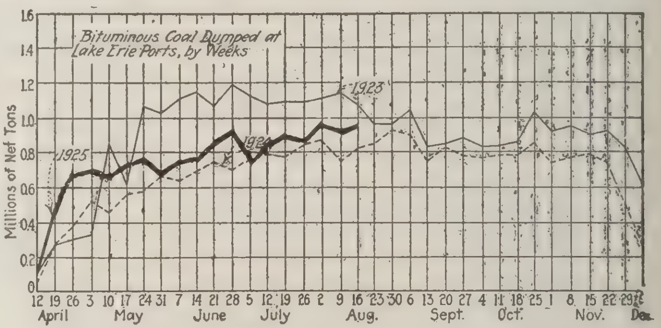
## Soft Coal Shows Gradual Improvement; Anthracite Moves Rapidly

Gradual improvement in demand for bituminous coal, reflected in the moderate, but steady rise in the rate of production which began late in June, and a modest appreciation in price levels characterizes the present position of the soft coal markets of the country. The betterment in demand is more strongly felt in the sale of prepared sizes than in the movement of steam coal. Although the threatened suspension in the hard coal regions must be given credit for some part in the changes of recent weeks, the bigger influence has been the seasonal increase in domestic demand.

These are the days when the country retailer begins to buy more freely because his farmer customers enter the market. If further proof of this is wanted, it is necessary only to point to the fact that the most optimistic reports on the domestic outlook come from the Middle West, the South and the Southwest. The Middle Atlantic and New England states, the territory of heaviest anthracite consumption, still find improvement in the domestic bituminous market a hope rather than a reality.

The improvement in domestic demand, however, has not been without its drawbacks. It has eliminated the necessity of crushing mine-run in the Illinois fields, but it has also brought such a production of fine coal both there and in adjacent fields that prices on screenings have slid off. Eastern Kentucky, it is true, has been an exception in this decline, but other parts of that state and Indiana have not fared as well. From Ohio, West Virginia and western Pennsylvania, however, come reports of a stronger undercurrent in steam coal prices generally and a similar feeling of optimism pervades most Atlantic seaboard markets.

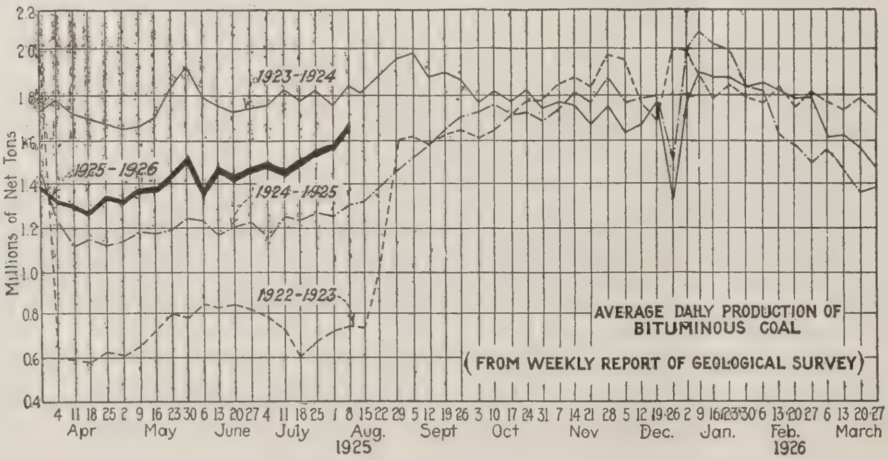
As might be expected, anthracite demand maintains a keen edge. The major producers are in a position where they can close the doors to business tendered by new customers. Some of the independents also have turned a deaf ear to orders and decline to quote on future shipments. There are others, however, who have reverted to auction-block salesmanship—but not with a great measure of success. At the close of last week there was considerable independent tonnage afloat in New York Harbor awaiting buyers willing to pay 40 to 50c. above average maximum line quotations.



Bituminous coal output for the week ended Aug. 1 is estimated at 9,957,990 net tons, as compared with 9,456,000 tons the week preceding. Anthracite output declined from 2,087,000 to 2,068,000 net tons.

*Coal Age* Index of spot prices of bituminous coal last week advanced one point to 167, the corresponding price being $2.02.

Dumpings at Lake Erie ports during the week ended Aug. 16 were: Cargo, 894,526 net tons; steamship fuel, 54,526 tons—a total of 949,052 tons, compared with 941,989 tons the week preceding. Hampton Roads dumpings in the week ended Aug. 13 totaled 438,456 net tons, compared with 461,259 tons the preceding week.



### Estimates of Production

(Net Tons)

| | 1924 | 1925 |
|---|---|---|
| **BITUMINOUS** | | |
| July 25 (*a*) | 7,785,000 | 9,343,000 |
| August 1 (*a*) | 7,723,000 | 9,456,000 |
| August 8 (*b*) | 8,036,000 | 9,957,000 |
| Daily average | 1,339,000 | 1,659,000 |
| Cal. yr. to date | (*c*) 274,615,000 | 285,493,000 |
| Daily av. to date | 1,477,000 | 1,533,000 |
| **ANTHRACITE** | | |
| July 25 | 1,837,000 | 2,049,000 |
| August 1 | 1,720,000 | 2,087,000 |
| August 8 | 1,664,000 | 2,068,000 |
| Cal. yr. to date | (*c*) 55,373,000 | 55,992,000 |
| **BEEHIVE COKE** | | |
| August 1 (*a*) | 95,000 | 122,000 |
| August 8 (*b*) | 89,000 | 124,000 |
| Cal. yr. to date | (*c*) 6,591,000 | 5,978,000 |

(*a*) Revised since last report. (*b*) Subject to revision. (*c*) Minus two days' production to equalize number of days in the two years.

### Midwest Outlook Brightens

In the Midwest business is quite satisfactory in the coarser sizes of domestic coal from Indiana and Illinois. The mines best situated in Indiana are those producing Fourth Vein coal and one or two that produce freak Fifth Vein coal. In Illinois the leaders are the Franklin County operators and some in Saline County. Orders have been coming in in such a satisfactory manner for 6-in. lump that many producers have temporarily stopped soliciting business for it. The demand for 6x3-in. egg and for 3x2-in. egg is fair, but the smaller domestic nut sizes are not moving forward in great volume. Depending on developments in the East, further price changes may be put in effect soon, although most producers are evasive on this point, preferring the policy of watchful waiting for the time being.

Steam coals hit a temporary sag, screenings slipping about 10c. in practically all of the producing fields. This was brought about by increased tonnage from the retailer and by the fact that the big industrials in Chicago are buying on the open market only for current needs. It is expected that the steam sizes will come in for a slow and gradual advance as Sept. 1 approaches. This prediction is based on the fact that there is little industrial coal in storage in Chicago. Many Illinois and Indiana mines that have been closed since early last spring are reopening.

Eastern coals, especially smokeless, are extremely active. A number of producers have withdrawn their $3.25 circular to the retail trade ($3 to the wholesalers), refusing to book any more business until they clean up some of their current obligations.

Anthracite coal is in very strong demand. Some of the big hard coal companies with sales offices in Chicago have instructed their offices to withdraw all prices on certain sizes and to take on very little business on the other sizes available for shipment.

The tone of the Chicago market on the whole is very satisfactory, with more improvement in sight.

In the Williamson and Franklin County fields there is much activity. The crushing of mine-run has practically stopped because domestic business has picked up enough to enable a sufficient tonnage of screenings to come through to take care of contracts. Some mines that belong to big companies are working five days a week but the average working time is two to three. There has been a good demand for lump and egg up until this week when lump has dropped off but it is pretty well sold up ahead. Domestic is moving in spurts and shows that the market is not steady. Railroad tonnage is unusually good. Strip mines are practically working full time. Prices are not steady.

In the Duquoin field working time is from three to four days a week at the mines that are working and strip mines are working full time. There are no changes in prices.

**Coal Age Index of Spot Prices of Bituminous Coal F.O.B. Mines**

| | 1925 | | | 1924 |
|---|---|---|---|---|
| | Aug. 17 | Aug. 10 | Aug. 3 | Aug. 18 |
| Index ........................ | 167 | 166 | 163 | 165 |
| Weighted average price........ | $2.02 | $2.01 | $1.97 | $2.00 |

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States, weighted first with respect to the proporions each of slack, prepared and run-of-mine normally shipped, and, second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke: 1913-1918," published by the Geological Survey and the War Industries Board.

A little activity is beginning in the Mt. Olive district. In the Standard field, it is hard to make any statement that covers the field. Some mines run long and lose money. Others run only a day or two a week and get above cost for their coal. Railroad tonnage is fairly good and the feeling is general that Sept. 1 will see business good in this field.

Domestic movement in St. Louis is fairly good on the better grades of coal for storage. Apartment houses are ordering in some Standard and school coal is being put in. Demand for other fuels such as anthracite, smokeless and coke is not good. Southern Illinois high grade is in fairly good favor. Eastern coals are strong in the Illinois territory and weak west of the river. Arkansas is finding good movement into the western part of Missouri.

### Prices Rise with Brisk Trade in Kentucky

Coal prices in Kentucky are steadily advancing on prepared sizes, which are in demand. Screenings from the eastern Kentucky field are very firm, and though quoted at as low as $1.10 in a small way, not much quality stock is to be had under $1.25. Mine-run continues strong at $1.35@$1.75. Prepared starts at $1.75@$2 for small nut, $2.10@$2.35 for egg and small lump and go to $2.65@$3 on 4-in. block, which could be had two weeks ago at $2.

Higher prices prevail also in western Kentucky, where 6-in. block is $1.75@$2; lump and egg, $1.60@$1.85; nut, $1.35@$1.65; screenings, 70@85c., and mine-run, $1.10@$1.50. Screenings, which are in much larger production, are harder to dispose of, as the field has never had a really good market for surplus production in periods of activity.

Buyers are being scared into the market by strike talk in the East. Retailers are buying freely and industrial, utility, railroad and other concerns are stocking. Eastern Kentucky operators have plenty of business in hand with a strong indication of higher markets and better prices.

Retailers have advanced prices 50c. a ton all along the line, notifying good customers in advance and booking a considerable amount of future business.

The market on prepared is 50c. to 75c. a ton higher than thirty days ago, and without loss on the screenings side of the account for eastern Kentucky.

Milwaukee's coal trade is more lively. Both anthracite and bituminous coal are moving out quite freely. Total receipts by cargo for the season up to Aug. 13 aggregate 1,850,067 tons—426,534 tons of anthracite and 1,423,533 tons of bituminous coal. These receipts are greater than last year by 3,896 tons of anthracite, 326,772 tons of bituminous coal, and 330,668 in the total tonnage. During July, Milwaukee received 4,934 tons of anthracite and 32,634 tons of bituminous coal by all rail routes.

### Northwest Sees Gradual Pickup

Retail trade at Duluth and Superior and in some of the larger towns over the Northwest shows signs of picking up, but general movement off the docks is still light. A sharp spurt is expected, however, around the beginning of next month. An improvement has taken place in industrial buying, but individual orders have been small. Better shipments of steam coal to iron mining companies on the Minnesota ranges also are reported. Utilities have been inquiring for substantial tonnages lately, due to a shortage of water.

Thirty-seven cargoes of coal, including only one of anthracite, were unloaded at the docks last week, and sixteen cargoes, all bituminous, were reported en route. During July 1,362,574 tons of bituminous and 139,292 tons of anthracite was unloaded at the docks. For the season to Aug. 1 anthracite receipts totaled 676,609 tons and bituminous receipts, 4,234,111 tons. This is an increase over last year for the same period of 87,459 tons of anthracite and 1,410,138 tons of bituminous.

Shipments from the docks during July were 14,693 cars, of which 6,806 cars were from Duluth and 7,887 from Superior, compared with 11,955 cars during June and with 15,301 cars during July last year. Larger cars were used by the railroads this year, there being few ore cars in commission.

As stocks on the docks Aug. 1 were 675,000 tons of anthracite and 4,350,000 tons of bituminous, retailers and consumers are not worrying over the possibility of an anthracite strike. Then too the use of Pocahontas and other smokeless coals as substitutes is gaining.

Prices of both anthracite and bituminous coals are firm and unchanged. Pocahontas prepared sizes are in demand at $7.50 on dock.

### Trade Picks Up in Southwest

The market is improving throughout the Southwest. Dealers are buying and some consumers are beginning to fill their bins. Operators who did not raise their quotation on Kansas shaft lump to $4.25 on Aug. 1, followed the lead of their competitors on Aug. 15. Kansas shovel lump is now $3.75; shovel nut, $3.50; shovel mine-run, $3, and shovel screenings, $2.50. More mines are expected to be opened in Kansas early in September. McAlester, Okla., has a steady production under the 1917 scale and Henryetta, Okla. also is producing some coal, but under difficulties due to the picketing of mines by miners opposing their operation under less than the 1924 scale. Work in Arkansas gradually is getting under way, part of it under the 1917 scale. Many operators in the Arkansas field are holding back until they see what results attend the efforts of the pioneers to effect a lower scale throughout the state.

In Colorado an increase is noticeable in the demand for domestic coal, and a further substantial increase is expected. There have been no changes in prices during the past week.

The market for Utah's coal mines is slowly improving, but the situation is far from satisfactory. Storage orders are 50 per cent below normal, and normal has been none too good for the past few years. Dealers fear they will be swamped following the first cold storm of fall. Operators report a shortage of closed cars, but they are able to get other equipment in sufficient volume to carry on. Working time is around two and one-half days a week, taking the state as a whole.

One of the largest producers in Utah reports California as the best market for coal at this time. This market is taking 8-in. lump and stove coal, it was stated. The price situation is unchanged, except that there is not so much probability of an increase as there was. Dealers have been making the most of the price raise rumors to get winter storage business, but operators say little about it now.

### Smokeless Strong at Cincinnati

At Cincinnati the long expected rush of buying orders for smokeless coal finally came and within a week there was an advance of $1 a ton on domestic sizes. Now $3.50@$3.75 generally is asked, with some selling agencies in Cincinnati asking $4 for prompt shipment. True this "top" is not an actual price, being intended to curb a mad rush, but three of the biggest companies are asking it. Smokeless nut is $2.50@$2.75; mine-run, $2.25@$2.50, and what free screenings there are command $1.50.

Domestic business generally has moved up, some of the buying being due to strike talk in the East but most of it has been to fill the 25 per cent shortage in the yards and householders' bins. Southeastern Kentucky has moved up the price all along the line with Hazard quoting $2.40@$2.50; Harlan, $2.50@$2.60 and Elkhorn, $2.75 for block. Egg, 2-in. and mine-run are practically in the same position as last week, screenings having a wider spread of $1.10@$1.25, due to the increase in orders for domestic.

Generally speaking West Virginia high-volatile coals have not shared so well in the upturn, 4-in. block being quoted at $2.25@$2.50, with no perceptible change in the other sizes.

There has been no diminution in production, 14,030 loaded cars having passed last week from West Virginia and eastern Kentucky through the Cincinnati district of the American Railway Association. This is the second largest interchange in history. Of these, 3,292 were en route to the lakes.

River business still holds up with around 25,000 tons moved through the Cincinnati harbor this week. Retail figures are unchanged but some dealers are preparing to move up the price.

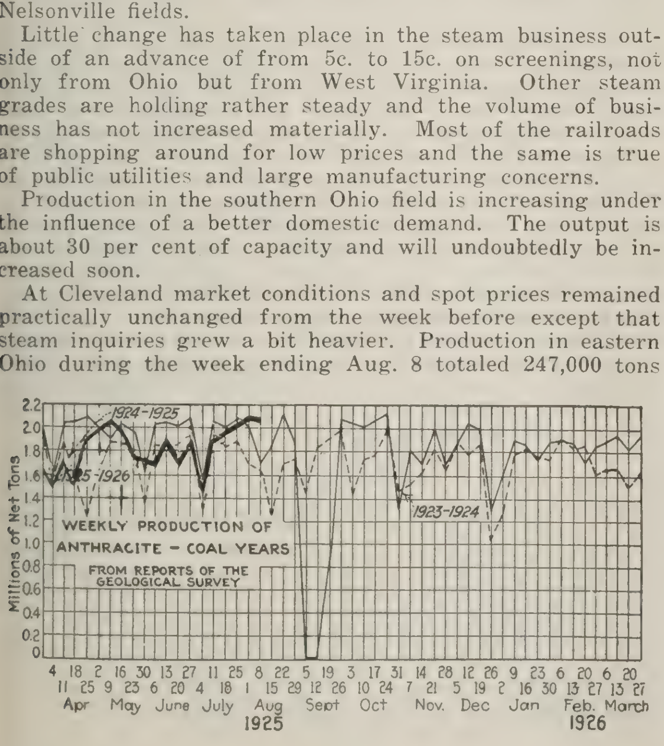
Domestic demand has shown quite an increase in Columbus and central Ohio during the past week. Retailers are hurrying into the market for stocks as householders are placing orders in larger number. The shortage applies to all grades, including smokeless varieties, splints and Ohio mined coals. Retail prices are stronger with smokeless selling at $8@$8.50; splints, $7.25@$7.75 and Hocking and Pomeroy grades at $6@$6.75 delivered.

Mines are being placed in operation in the Hocking Valley field and a generally better tone has developed in domestic circles. While production has not increased as yet to any extent still steps have been taken to almost double the output in certain places in the Crooksville and Nelsonville fields.

Little change has taken place in the steam business outside of an advance of from 5c. to 15c. on screenings, not only from Ohio but from West Virginia. Other steam grades are holding rather steady and the volume of business has not increased materially. Most of the railroads are shopping around for low prices and the same is true of public utilities and large manufacturing concerns.

Production in the southern Ohio field is increasing under the influence of a better domestic demand. The output is about 30 per cent of capacity and will undoubtedly be increased soon.

At Cleveland market conditions and spot prices remained practically unchanged from the week before except that steam inquiries grew a bit heavier. Production in eastern Ohio during the week ending Aug. 8 totaled 247,000 tons which represents 35 per cent of capacity. This was 18,000 tons more than was shipped the week previous.



### Pittsburgh Has Slight Upturn

At Pittsburgh demand is somewhat larger, movement a little heavier and coal is much easier to sell. Movement of domestic coal has begun in a moderate way. Operation has increased to about 20 per cent of capacity. The increase in demand is from the limited territory the district has lately been serving, as lower prices prevent competition with other fields.

There has been a slight change in the price range on gas lump and gas slack, with no change in gas mine-run or in steam coal. The latter may, however, be a shade firmer. Mines with good screening facilities have the advantage, mines shipping mine-run not being particularly better off than a week ago. Gas lump is now quotable at $2.40@$2.50; gas slack is $1.50@$1.60 and steam slack remains at $1.30@$1.40.

The coal situation at Buffalo has not changed much. Quotations are $1.60@$1.75 for Fairmont lump, $1.40@$1.50 for mine-run, $1.25@$1.40 for slack; $2.25@$2.50 for Youghiogheny gas lump, $2@$2.25 for Pittsburgh and No. 8 steam lump, $1.30@$1.60 for slack; $1.75@$2 for Allegheny Valley mine-run. Slack is scarce and strong.

### New England Trade Continues Dull

Developments in New England during the week were somewhat less disappointing than was feared. A few shippers have tried to maintain the higher prices of a fortnight ago, but those who have had coal to move have been under pressure to sell at the lower levels reported last week.

In coastwise trade there has been next to no improvement in buying, and sales continue to be restricted for the most part to transactions where there is an inducement to buy.

Accumulations are again the rule at Hampton Roads, with prices fluctuating between $4.25 and $4.50 per gross ton f.o.b. vessel. The slightly remunerative prices of early August drew down a very much increased tonnage, and now the agencies are again seeking buyers. While it is understood the threatened suspension of mining in the anthracite districts is supplying a much better market for bituminous in the Midwest there has been no such excess of buying in Boston. Consumers of bituminous coal remain indifferent and there has been nothing so far to warrant a higher price basis.

On cars at Boston, Providence, and Portland the market is rather uneven. A few factors are trying to keep sales up to the asking figure of $5.60@$5.75, but even they are willing to name the same figures for delivery extended through the winter. Others who are pressed with coal are releasing it at prices from $5.40 up. Boston receipts have been rather light for a fortnight, but it is expected there will be more arrivals during the next ten days.

Within the territory open to Pocahontas and New River from tidewater there has been no improvement in demand for Pennsylvania coals all-rail, but in the narrow region east of the Hudson River where supply is exclusively all-rail the steam grades are in somewhat better request, probably in sympathy with the more active market farther west.

### New York Sees Gradual Betterment

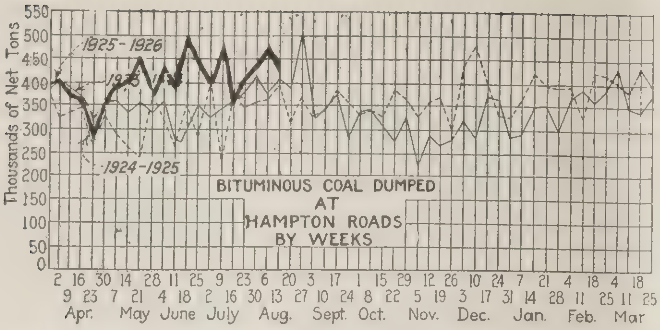
Improvement in the soft-coal trade at New York is progressing. High-volatile coals are more active and the low-volatile grades are in better demand but no better in price. Operators believe it will take at least six weeks' idleness in the anthracite regions to straighten out market conditions.

Though shipments to the local piers are heavier this is of no apparent benefit to the industry at this time. The coal is kept moving, but prices are no better.

Buying shows some improvement. Operators are hopeful of better business with the approach of the fall season. Heavier business is reported from inland points with prices remaining at practically last week's basis.

There is nothing akin to a rush in the Philadelphia market, but demand continues to gain as in recent weeks. If there be a suspension in anthracite mining, the bituminous people hardly expect to feel any effect for a month or six weeks.

Demand has been met so easily that prices have not been touched. As production increases, however, expenses de-



crease proportionately, and the outlook for increased tonnage grows with each passing day. The utilities, like the railroads, gas, and power plants, are buying very freely and will continue to do so. The tidewater situation presents little change.

The Baltimore trade continues to show a healthy increase in export activity and there is a marked improvement in the demand for bunker coals from vessels engaged in other than the coal carrying business. Prices show no material change. The demand is still quite light, and sales competition keen.

### Birmingham Feels Better Now

The coal trade is picking up some all along the line though buying is not to say active as yet. There is a feeling, however, that a gradual improvement is to be expected from now on. Demand for domestic coal is gaining a little strength, spot buying showing some increase over last month and the movement against contracts being heavier. There are still restrictions on the shipment of contract allotments, which leaves the mines with a surplus for the open market which is not disposed of without unusual effort.

The steam market which has been fairly good for several weeks is gaining further strength. Inquiry is increasing and bookings are somewhat better the past week. Cotton gins, ice plants and power companies are using considerable coal in the aggregate and the general industrial demand in the open market along with the contract requirements is keeping some mines on five-day schedules. Bunker coal requirements for the past week have been larger than they have been for some time, though the demand from this direction is always irregular.

Production from this field is good for this season, averaging around 365,000 net tons weekly. Prices are stable.

### Hard-Coal Trade Active

Activity in the anthracite market at New York centers around tidewater. Heavy shipments of independent coals have been coming to the piers and many loaded boats await buyers. Considerable of this tonnage consists of chestnut and pea sizes. The former size is gaining strength rapidly and in the opinion of some shippers will soon take the lead now held by stove.

For loaded boats of broken coal quotations are based on a mine price of about $9.20, with $10.25 the average price asked for stove coal on the same basis. The latter is from 40c. to 50c. below the average maximum price asked along the line.

The large companies are sold up to their regular trade, and some independent producers have refused orders and quotations for future shipments.

Barley is practically out of the market to spot buyers; rice is scarce and No. 1 buckwheat is gaining strength.

Retail dealers report brisk business, but so far have been able to take care of customers' wants without trouble.

The wholesale anthracite market at Philadelphia has tightened up greatly, and most shippers, company and independent, are sold up on their estimated production for the balance of the month. Orders from distant points continued to flow in, and local trade also has picked up rapidly of late.

A few independents are putting premiums on their coal, although they are not moving much in this market, which has always been a difficult one in which to sell premium coal. Retail trade is quiet and it looks as if any general increase in retail prices would be postponed until Sept. 1.

Steam sizes are moving well, and all independents are able to get full price.

As warm weather prevails at Baltimore household consumers of anthracite are tardy in stocking up. The buying public seems to take it for granted that both sides are bluffing in the hard-coal dispute, and that some way will be found to prevent any serious stoppage of work by miners. The demand for coal for use in the fall and winter is not even up to average for the majority of dealers, although some report that they are running ahead of their usual August deliveries.

At Buffalo the demand for anthracite for house use has increased at a good rate lately, but it has not become at all insistent yet. Shippers and retailers are wondering why this is so, with a strike apparently imminent, for, unlike a bituminous strike, there is no coal to be dug by non-union miners. The extra demand has been enough to give consumers a pretty good supply, but it has not been what it should have been.

The demand for coke has increased at a petty rapid rate, the price of furnace coke at the curb still being $9@$9.50.

Lake shipments are increasing slowly. Last week the amount loaded was 51,000 tons, of which 27,900 tons cleared for Milwaukee, 14,800 tons for Chicago and 7,300 tons for Green Bay. Rates remain at 55 to 60c. to Chicago and 50c. to Milwaukee and Green Bay.

### Connellsville Coke Market Braces

After a long period of stagnation the Connellsville coke market in the past week suddenly took a brace, with others predicted.

Just one week ago, when spot furnace coke was $2.90 and some contracts running were at not over that, the Jones & Laughlin Steel Corporation suddenly undertook to buy for the remainder of August and took 20,000 tons, from two producers, at $3. Two or three days ago it bought some 20,000 tons more, for September, at above $3, and seemed to want a considerable additional tonnage, for September, on which it was quoted $3.50, which it considered impossible. Recently it blew in another blast furnace and it is producing scarcely any coal itself, making its own coke chiefly from purchased coal.

The miscellaneous buyers, of small lots for various purposes, increased their buying and by the middle of this week had to pay $3, against $2.90 formerly. Larger, and unfamiliar, buyers appeared, chiefly eastern gas companies, and they have bought several good sized lots for 30 to 60 days delivery, paying advancing prices up to $3.25, which has been paid in several cases and now represents flatly the spot market, with predictions of higher prices any day. With the blast furnaces, a few cents difference in the price is highly regarded. With these gas companies it counts for practically nothing. It is awkward for them to switch from anthracite to coke and when they do even a dollar on the coke is a relatively small matter.

As usual, operators will be keen to blow in ovens and get ready for the demand now plainly in prospect. Often they do this so rapidly that they forestall the price advance they are endeavoring to anticipate and take advantage of, but there is by no means unlimited opportunity for coke production to be increased in the next few weeks. First, certain conservative interests have said $3.50 is their price and they will not produce until they get it. Then there are ovens that have been idle so long they will require considerable work to get them in shape. Finally some operators have sold themselves up so well on coal that they have not the coal to spare to run many additional ovens, nor would it pay them as the coal prices are not bad.

Heating or medium sulphur coke last week advanced from $2.65 to $2.90@$3 and it is doubtful if it could be bought at under $3 now. Foundry coke is quite unaffected by these developments, being quotable unchanged at $3.75@$4.25, with a limited demand.

# Foreign Market And Export News

## British Coal Market Suffers from Sharp Competition

The Welsh steam coal trade last week was very unsettled with business difficult to arrange. Buyers abroad, chiefly foreign depot firms and railways with contracts for Welsh steam coal, have pressed for earlier deliveries, but generally buyers have not come forward freely because they have relied upon buying from Germany and elsewhere. The extra shipping activity has been sufficient to give South Wales ports quite a busy appearance, despite the fact that collieries closed down in the last twelve months through trade depression have not been reopened.

There has been a clearance of standing stocks, and with the current output fully absorbed, colliery owners have been unable to cover all the business offered to them. Buyers are looking forward to a cut in the price of Welsh coal, and unless that is made there can be little trade expected throughout the rest of August.

Foreign buyers seem to be quite indifferent. Nothing is being done in the contract business whatever, all inquiries for the present being in suspense. Reports from the Continent indicate that not only Germany, but also Polish Silesia and Russia are offering cheap supplies of coal over a wide area in Europe, while American coal is being pushed in Italy, the Western Islands and South America.

Coal production by British mines during the week ended Aug. 1, a cable to *Coal Age* states, totaled 4,580,000 tons, compared with 4,525,000 tons in the week ended July 25.

Employers in the Irish coal trade have decided to import non-union labor and seek military protection for unloading colliers, in the hope of ending the five weeks' deadlock which has existed in the industry through the controversy between the union headed by James Larkin and another body of workers who broke away from this union and formed their own organization.

### Market at Hampton Roads Gains in Strength

The market at Hampton Roads last week was considerably stronger, and inquiries were on the increase. The demand in the West appeared to be holding the Eastern demand stronger, and shippers generally reported business good.

Foreign shipments were holding their own, and the prospect of a strike was improving the spot market. No long contracts were being made, shippers being wary of conditions a month or two hence.

### Industrial Grades Sluggish In French Coal Market

The French coal market situation is still poor in industrial grades, both for French and foreign products. For domestic fuels conditions are rather brighter.

Agitation among the miners has spread to Carmaux (Midi region), where the men threaten to strike unless they obtain the concessions given to miners in the North and Pas-de-Calais. The latter have been granted an extension until Sept. 15 of the allowance of 20 per cent on account of the high cost of living. Unrest is in evidence in the Sarre district also, due partly to Communist influence.

The period of stoppage of the water ways is virtually at an end.

During the first 28 days of July the O.R.C.A. received from the Ruhr 204,868 tons of reparation coke, a daily average of 7,320 tons.

In the month of June the Office des Houillères Sinistrées received from the Ruhr 505,600 tons of indemnity fuels, including 256,000 tons of coal, 224,400 tons of coke and 24,400 tons of lignite briquets.

### Belgian Industrial Market Slow; Household Trade Mending

No improvement is to be noted in the Belgian coal market. As the strike in the iron and steel industry continues, a dead calm prevails in industrial grades. With regard to household fuels the situation is on the mend; semi-bituminous and dry descriptions are getting scarce and some people even think that in a short time an upward movement will take place.

Neither Dutch nor British competition is so active.

Coal output in the Ruhr in the first five months of 1925 totaled 54,673,980 metric tons, against 42,397,564 metric tons in the corresponding months of 1924.

# News Items From Field and Trade

## ALABAMA

Coal production in Alabama for the month of July, 1925, totaled 1,600,000 tons, the largest output since March, 1925, and the first time this year that the 1924 figures have been topped, according to a report by the Alabama Mining Institute. Figures by months for the two years follow:

| | 1925 | 1924 |
|---|---|---|
| January ......... | 1,641,000 | 1,855,200 |
| February ......... | 1,583,000 | 1,840,000 |
| March ............ | 1,726,000 | 1,734,000 |
| April ............. | 1,450,000 | 1,713,000 |
| May .............. | 1,596,000 | 1,637,000 |
| June ............. | 1,550,000 | 1,550,000 |
| July .............. | 1,600,000 | 1,400,000 |

## ARKANSAS

Operators with mines in Arkansas are watching interestedly the results of a recent move by the Peterbaugh interests to bring about a wage reduction in the state. The Greenwood Coal Co. in its mine at Greenwood was employing eighty-four men at the 1917 scale the week ending Aug. 9. In that week it averaged 200 tons production a day. The Russellville Coal Co. reopened Aug. 11 with forty-five men. Several smaller mines also are being opened under the 1917 scale, and operators with large holdings in the state whose mines now are idle say their reopening will depend on the acceptance by miners of less than the 1924 scale.

## COLORADO

The States-Hall Coal Co. is the name of a new company organized Aug. 1, as the result of the consolidation of the States and Red Mountain coal mines. Owing to a recent ruling announced by the state coal mine inspector, it was necessary to spend several hundred dollars in installing a ventilating fan and also to hire a licensed man in charge, so the management of the two mines decided that they could cut expenses in half by an arrangement of this kind.

Notice from three coal companies operating at Walsenburg was received by the State Industrial Commission Aug. 5 to the effect that wages of the employees of the companies would be reduced approximately 11 per cent within the next thirty days. The companies giving the notice are the Dick Coal Co., the Garden Coal Co. and the Jewell-Colliers Corporation. The action of the coal companies, their officials told the commission is in conformity with the recent policy adopted by the Colorado Fuel & Iron Co., which reduced the wages of its employees. The Colorado Fuel & Iron and these three companies reduced wages approximately 20 per cent, with the consent of the commission, several months ago.

## ILLINOIS

Operation is picking up in southern Illinois. Old Ben Mine No. 8, at West Frankfort, employing 1,000 men, resumed Aug. 17, and No. 12 mine, at Christopher, employing 600 men resumed Aug. 10. With the resumption of three other mines at West Frankfort this month, more than 2,600 men idle since last spring have returned to work. The Old Ben company still has seven mines in this section not affected by the work order.

Three mines of the Madison Coal Corporation are showing an increase in business, which, coming at this season, indicates a good fall and winter. The coal from the three mines is used by the Illinois Central for the operation of trains. The mines, which are at Mt. Olive, Glen Carbon and Carterville, are working from four to six days a week.

After closing a lease for the mine of the Assumption Coal & Mining Co., seven miles north of Pana, Glen Young and ten associates, who announced that the mine would resume operations at once, surrendered their lease Aug. 10. Young found, on examination of the workings, that the expense of repairs and machinery made the reopening of the mine prohibitory. It is said the present machinery will be junked and the mine sealed.

The Silver Creek Mining Co., Farmington, placed sixty additional men at work July 31.

The Peabody Coal Co., Chicago, has purchased the Woodside Coal Co. mine located southwest of Springfield. The price involved is given at $107,000. Two other mines recently purchased by the Chicago company are located at Auburn. They were owned by Solomon Brothers. With the deed to the Woodside mine was filed a bill of sale covering personal property at the mine and also a deed covering the coal rights. The latter were conveyed by Milton Hay Brown, Jane Logan Brown, Christine Brown Penniman, Logan Hay, Lucy L. Hay and John A. Dushane Penniman to the Woodside Coal Co. and thence to the Peabody company. The coal rights were sold for $37,000.

International Auditor A. T. Pace took up the charter of Local Union No. 994, United Mine Workers, at the Sunnyside coal mine, one of the first mines sunk in Herrin. A fire a few years ago destroyed the tipple and washer of the mine and a few months later the property was sold. Since then it has had a varied existence and before the final shutdown owed its employees for about one month's work, which has never been paid.

The mine of the Southern Coal & Mining Co. at New Baden, resumed work July 28, after being idle since last March. About six hundred miners are employed in the mine.

## INDIANA

Application for the appointment of a receiver for the Vulcan Coal Co., of Evansville, was filed in Vanderburgh County probate court last week by Charles L. Boyles, a stockholder. Boyles also asks that officers of the company be compelled to surrender to stockholders certificates of stock yet outstanding. The Vulcan Coal Co. is said to be incorporated at $1,000,000 and to control 49 per cent of the stock of the Southern Indiana Coal Corporation.

## IOWA

The Pearson Coal Co. now has three mines at Clarinda, the last one having been opened recently near Hawleyville, with only a 55-ft. lift.

The Black Diamond Coal Co., Gravity, is installing a new boiler and otherwise placing its mine in shape for extensive mining operations during the coming season. Mining machines are to be installed and a new railway switch is to be laid.

## KENTUCKY

J. A. Straughan has been appointed general superintendent of the Weeksbury operation of the Elkhorn Piney Coal Mining Co., vice J. J. Fluck, resigned. The Elkhorn Piney Coal Mining Co. is a subsidiary of the Milwaukee Coke & Gas Co. The Weeksbury operation, which is in 38- to 50-in. coal, was brought to a production of approximately $40,000 tons per month while under the superintendence of Mr. Fluck.

Officials of the Chesapeake & Ohio R.R., on Aug. 13, announced at Ashland, that the 28 miles of the Sandy Valley & Elkhorn R.R. in Eastern Kentucky, had been placed under sole operation of the road, the deal having been pending for a year before the Interstate Commerce Commission. The road originally was built by the Baltimore & Ohio R.R. to connect the Consolidation Coal Co. properties, and later sold to the coal company, which in turn has transferred it to the C. & O., which agrees to pay $6,800,000 in cash for the roads obligations, now amounting to $5,000,000 in capital cock, and $2,200,000 in bonds, in addition to $2,536,220 for advances by the coal company. Between Shelby Junction and Dunham, the road serves nineteen coal mines.

## MISSOURI

Coal in well paying quantities is being mined on a tract of land owned by John Bohon, in the Lone Star school district, ten miles southeast of Sedalia. Operations were begun about ten days ago. Tunneling 100 ft. into the ground the miners are working on an 8-ft. bed. Fifteen men, miners and drivers, are employed on the premises, digging the coal and freighting it to Sedalia. Three trucks are now in use for that work.

Coal operators in the vicinity of Fulton, contemplate an indefinite suspension of operations at the expiration of the present agreement with the miners. The operators have not met with the mine union officials relative to the proposed increase in wages, taking the position that it is useless to confer as the mines cannot compete with Illinois coal if production costs go up. The miners have asked a tonnage increase for digging coal and higher wages for surface workers.

## NEW YORK

The Buffalo water works contract for furnishing 45,000 tons of slack was awarded to the Lake Erie Fuel Co., of Buffalo, on its bid of $1.39 on a $2.34 freight rate, which indicates that Pennsylvania coal will be furnished.

## OHIO

The Pittsburgh Coal Co. announces that miners loading coal in the three mines of the company at Pomeroy, working on the 1917 scale, are earning an average of more than $7 a day, based on the 14-day pay distributed Aug. 9. The highest pay among 400 men in the employ of the company was $9 per day and the lowest was $6 a day. The three mines are now running from 1,300 to 1,500 tons of coal a day. At the Dark Hollow mine the highest pay for those who worked every day was $120.96 and the low $110.92. At Forest Run the high was $136.68 and the low $84.33. At Mine No. 75 it was $136.06 high and $81.04 low.

Officers of the Island Creek Coal Co. in Cincinnati learned that Ed Merrell was critically ill at his home in Montreal, where he is identified with both coal and steamship interests. Mr. Merrell has many friends in West Virginia and southern Ohio. It was in Logan County that he put in many years developing various mining interests, notably those of the Island Creek company.

The Hysell Run mine, near Cannelville, resumed operation Aug. 3, giving employment to about 50 men, and the management is reported to have on hand orders sufficient to guarantee the men four or five days work each week throughout the winter. The E. A. Goslin mine in Perry county, between Zanesville and New Lexington, on the C. & M. V. Ry. also opened Aug. 3. About 25 men were hired at once, and it is believed that there will be work for at least 50 more in another week. Both mines resumed under the Jacksonville agreement, according to Frank Bender, subdistrict secretary of the United Mine Workers.

Two mines of the Clarkson Coal Co., at St. Clairsville, which had been working steadily throughout the summer, have suspended operations, owing to the competition of non-union mines of West Virginia. About 750 men were employed and the daily capacity was 4,500 tons. It is pointed out that only 11 out of 131 mines in the eastern Ohio field are now operating.

After ten years of continuous maintenance of a branch office in Cincinnati word came from Lynchburg, Va., the headquarters of the Chesapeake & Virginian Coal Co. to close the suite maintained in the Union Trust Building. George W. Hill, who was active in the company until he died, had charge of this branch and was succeeded by Colonel Tom Morgan, a former president of the Cincinnati Coal Exchange, about two years ago. It is planned to operate the Western business from a branch that has been opened in Detroit under the direction of Fred Walker.

Repairs are being made to the equipment of the Bear Run Mine, at New Lexington, owned by the Gosline Coal Co., which will be put into operation after an idleness of several years. Officials of the Penrod Coal Co. also announced that Mine No. 3, located at Crooksville, will be placed in operation in a short time. A satisfactory settlement with union men is in prospect, according to the officials. In addition several smaller mines will soon be put into operation in the New Lexington section.

Numerous cities and towns in the southern Ohio coal fields have protested to the Columbus Chamber of Commerce recently against the purchase of Kentucky coal by the Columbus Board of Education for school buildings. The cities complaining were Chauncey, Buchtel, Glouster, Trimble, Jacksonville, Nelsonville, Athens and New Lexington. The protests were made on the ground that Columbus is the logical market for Hocking Valley coal and that Columbus wholesalers and manufacturers enjoy fully 80 per cent of the commercial business originating in the Hocking Valley. It also is set forth that coal is the chief product of that section and in order to pay their taxes the operators must sell coal. The Board of Education says that Kentucky coal was selected because operators could insure delivery by Aug. 1 and also because of no clause in the contract exempting the concerns from delivery in case of a strike.

The Wallins Creek Coal Co., of Cincinnati, Ohio, and its representation of Harlan, Hazard and Darby coals, has been consolidated with the Logan-Pocahontas Fuel Co., also of Cincinnati.

The equipment of the Black Diamond Mine, located near Nelsonville, and operated under a co-operative plan by Hall Bros., was completely destroyed recently. The mine was entered and the motors, mine cars, tracks, supports and in fact all equipment was destroyed by sledgehammers and axes. Steps have been taken to rebuild the plant.

## OKLAHOMA

The attempt to operate under the 1917 scale in the Henryetta field is meeting with persistent resistance on the part of District 21, United Mine Workers, aided by representatives of the international and officials of District 14 (Kansas). The order of Sheriff John Russell of Okmulgee County forbidding public prayer meetings by miners opposing open-shop operation of the mines will be fought in court, aided by attorneys of the American Civil Liberties Union, which, in a dispatch on Aug. 11 from New York, offered its assistance. On Aug. 14 troopers made four arrests of miners charged with disobeying the sheriff's no-prayer-meeting order. Mine union leaders said the men exposed themselves to arrest in order to test the validity of the order in the courts.

**Commissary at Edgewater, Ala.**

In these days of good roads and automobiles the "Company Store" is brought into direct competition with the metropolitan emporium. Furthermore, today the mine worker is paid in cash and spends his earnings where he pleases. In order to retain its custom, therefore, the mine commissary must offer values and service at least equal to those of its competitors. The day of gouging at the company store is gone—let us hope, forever.

**Discharging Station of Cableway at LaColeman, Ky.**

The coal is brought to this point across the Big Sandy Fork of the Cumberland River to be loaded onto the tracks of the Kentucky & Tennessee Ry. shown in the foreground. The Comargo Coal Co. operates the cableway and mine.

## PENNSYLVANIA

Constitutionality of the state anthracite tax law "cannot be made to run the gamut of successive verdicts of juries." President Judge Hargest, of the Dauphin County Court, ruled Aug. 10 in an appeal of the Hudson Coal Co., refusing a new trial. The company has about 40 appeals pending. Recently when a jury trial was demanded in one of the cases, counsel submitted offers of proof for the defense in which they contended they would raise questions of fact not previously passed upon in other cases in which the constitutionality of the law was upheld. The court ruled out the offers and returned a verdict of $43,530 for the commonwealth. Counsel for the company said it was planned to appeal the case to the Supreme Court.

Judge Van Sweringen, in Uniontown, on Aug. 10 refused to grant a six months' extension to the Melcroft and other coal companies in the Indian Creek Valley to dispose of water taken from the mines, which the Supreme Court of Pennsylvania recently ordered must be stopped from draining into Indian Creek. The mines thus are "bottled up" and their losses will be large, it is believed. The Supreme Court decision held that after July 31, 1925, the mines must stop the water from pouring into the creek, but the coal companies filed a petition asking for six months' time. This the Uniontown judge has refused to allow.

Federal Judge Robert M. Gibson, in Pittsburgh on Aug. 13 appointed J. N. Jarvis, an attorney, receiver in bankruptcy for John A. Bell, coal operator and president of the closed Carnegie Trust Co. Jarvis is a member of a creditors' committee which was formed after the trust company was closed by the state banking department three months ago. Bell filed a voluntary petition in bankruptcy, Aug. 7, giving his assets as $1,628,535 and his liabilities as $8,669,097.

The Pittsburgh Coal Producers' Association reports that production in the union mines of this district for the week ended Aug. 8 was 60,825 tons. The weekly capacity is 629,880 tons. Thus production is 9.7 per cent of capacity. This rate compares with 7.5 per cent in the preceding week and 27.8 per cent in the same week last year. But 12 mines reported out of 80, compared with 14 in the preceding week.

Two men, a miner and his laborer, were fatally injured Aug. 3 in the Jermyn mine of the Hudson Coal Co. when a powder blast exploded prematurely.

Approximately 200 of the best-known men in the industrial world in Pittsburgh, New York and Chicago made an inspection of the Colonial, formerly the Old Alice mine, of the H. C. Frick Coke Co. Aug. 7 as guests of W. H. Clingerman, president of the Frick company, subsidiary of the United States Steel Corporation. The workings of one of the most modernly equipped mines in the country were exhibited, but of greater interest was the immense belt conveyor system from the mine to the river tipple, where coal can be dumped at the rate of 1,500 tons an hour from the belts into the tipple and into barges at the rate of 850 tons in 10 minutes. The equipment includes the longest belt conveyor in the world, 2,439 ft. long, and another which is 1,513 ft. long. There are nearly a score of belts in all.

## UTAH

In an address before the Lions Club of Salt Lake City on July 31, O. F. McShane, chairman of the Utah Industrial Commission, said that the 271 men who lost their lives in the Castlegate disaster in March of last year, together with the $750,000 spent in compensation and the $250,000 for the rehabilitation of the mine was all the result of carelessness of a fireboss. Mr. McShane declared that rescue workers found the body of the fireboss on a heap of coal with his lamp dismembered, one part clutched in his right hand and the other in his left. The dismembering of the lamp was against the safety rules of the mine, he said. The speaker termed the greatest safety factor a careful workman. He said that it is estimated that at least one-half of the industrial accidents of this state are due to the carelessness of employees.

## WEST VIRGINIA

Suit was instituted in the circuit court at Baltimore on Aug. 1 by bond holders of the Big Vein Pocahontas Coal Co. of West Virginia against former receivers-directors of the company alleging diversion of $100,000. The sum, it is claimed in the suit, should have been placed in a sinking fund for the redemption of bonds. The suit was filed in the name of Frank A. Furst, Paul A. Seegar, Ella H. Hughes, Bessie M. Rice, the Mercantile Trust and Deposit Co. and James Clark Murphy, holders of class B bonds, dissolved last year. Defendants were named as Edward P. Keech, Jr., Van Lear Black, Norville H. Carter, James L. Zelman and Henry H. Heiner.

The largest day's loading in the history of the Chesapeake & Ohio was on Friday, July 24, when 4,042 cars of coal were loaded and started to their destination. This shows the prosperity of the region, traversed by this carrier.

The first annual first-aid contest of the Island Creek Coal Co. was held at Holden, July 26. Twelve teams were entered in the meet which was won by Team No. 3, of Mine No. 8, captained by Fred Class. Second place was awarded Team No. 4, of Mine No. 1. Team No. 1, of Mine No. 11, and Team No. 12 of Mine No. 18, were third and fourth respectively. About 4,000 persons witnessed the contest. Howard M. Gore, Governor of West Virginia; R. M. Lambie, chief inspector, West Virginia Department of Mines, and D. J. Parker, chief engineer, Mine Safety Service, U. S. Bureau of Mines, Pittsburgh, addressed the meeting.

As showing a steady increase in operations, the Thurmond Coal Co., of Logan, with mines at Dabney, McBeth and Yolyn, has asked that 100 coal loaders be supplied by the Huntington branch of the United States Employment Service. The branch in question now has unfilled orders for approximately 500 loaders in the Huntington district, Kanawha Valley and eastern Kentucky mines.

Difficulty is being experienced in filling the demand for coal loaders in the vicinity of Huntington. About 500 loaders are still desired in coal fields tributary to the Huntington district. Mine help wanted for mines in southern and southeastern counties in West Virginia and eastern Kentucky include trackmen, motormen, brakemen and coal loaders.

The E. C. Minter Coal Co. has obtained an injunction restraining Raleigh County from proceeding with the construction of a road under its tipple. The injunction was issued by Judge J. W. Maxwell, of the Circuit Court of Raleigh County.

The Beckley Coal Mining Co., of Meadow Bridge, in Fayette County, recently was sold for $17,000 in an effort to satisfy a mortgage. It was owned by Clarksburg interests and consisted of 500 acres of smokeless coal land, held in fee, on which a first mortgage of $50,000 had been obtained. It was equipped to produce 500 tons of coal per day.

## WYOMING

The combination first aid and mine rescue team from No. 2 Mine, Cumberland, at a contest held in Rock Springs Aug. 8, won the right to represent the Union Pacific Coal Co. at the International First Aid and Mine Rescue Meet in Springfield, Ill., in September. The team's score was 97.5 per cent on the mine rescue problems and 90.3 per cent on the first aid problems. Teams from three Rock Springs mines, two Cumberland mines and from Superior, Reliance, Hanna and Winton participated.

## WASHINGTON, D. C.

The U. S. Civil Service Commission announces the following open competitive examinations: Under scientific helper, to fill vacancies at the Experiment Station of the Bureau of Mines, Pittsburgh, Pa., and in the chemical laboratory of the Bureau at Buffalo, N. Y., at a salary of $1,140 to $1,500 per year, applications to close Sept. 12. For second class steam-electric engineman vacancies are to be filled in the departmental service at Washington and in the Indian service throughout the United States, with an entrance salary of $1,320 in the District of Columbia and of $1,140 to $1,320 with quarters, heat and light in the Indian service, applications closing Sept. 21. Vacancies for junior metallurgist are to be filled at Frankford Arsenal, Philadelphia, Pa., and elsewhere at a salary of $1,860 to $2,400, applications closing Sept. 26. Applications for under laboratory mechanic to fill vacancies in the Division of Mechanical Technology, National Museum, Washington, and elsewhere close Sept. 22; the salary is $1,140 to $1,500. Full information and application blanks may be obtained from the Commission at Washington, D. C., or at the post office or custom house in any city.

## CANADA

Operations were resumed at the Cape Breton coal mines of the British Empire Steel Corporation, Aug. 10, in accordance with the terms of the interim six months contract accepted by the corporation and the miners. Coal cutting was resumed in two mines, about 1,500 men being taken on. It was expected that 5,000 men would be working by the end of the week. It is understood that sufficient orders are on hand to keep the mines working six days a week until the end of the season.

The shipments of Alberta anthracite under the reduced freight rate of $7 per ton arriving at Toronto are in no great demand, consumers apparently preferring a fuel with which they are familiar. It is being sold by the dealers at $15 per ton. There is some doubt as to whether the full amount of 25,000 tons arranged for will be obtainable at the Alberta mines.

Fears of a coal famine during the coming winter in the event of a strike of American anthracite miners have been dispelled by the arrival in increasing quantities of British anthracite. During the 12 months ending June 30 the imports of anthracite from Great Britain totaled 388,353 tons, valued at $3,517,576, as compared with 195,809 tons valued at $1,905,088 during the preceding twelve months. The imports in June were 59,435 tons.

According to word from Edmonton it looks now as if there would be a shortage in the 25,000 tons of coal that Alberta mines were given the opportunity of shipping to Ontario. The Drumheller Mines will be unable, according to reports, to make up their quota, the operators and miners having failed to make terms on a new agreement. The special $7 freight rate was good only to Aug. 15.

Output of coke continues to show a considerable falling off due to the Nova Scotia coal strike. In June 109,694 tons was produced in the Dominion as compared with 130,068 tons in May. A decrease of 16 per cent. Out of a total of 161,215 tons of coal used for coke making, 19,565 tons was domestic and 141,650 imported coal. Exports of coke in June fell from 4,968 tons to 3,567 tons, and imports rose from 45,945 tons in May to 55,836 tons.

# Traffic

## I. C. C. Refuses to Change Hampton Roads Charges

Charges for dumping and trimming coal at Hampton Roads are not unreasonable, according to the Interstate Commerce Commission in its decision handed down a few days ago in Southern Transportation Co. et al. v. Norfolk & Western et al, 101 I.C.C. 211. The Commission held that the horizontal manipulation of the chutes down which coal runs into the holds of vessels must be considered as part of the dumping service and not, as the railroads argued, an incident of the trimming service. The Commission also expressed the opinion that trimming and dumping charges should be published separately.

Charges for docking and undocking ships, for running of lines to make vessels secure at their berths and for the furnishing of fresh water are marine services beyond the jurisdiction of the Commission. The Commission holds, however, that it has jurisdiction over port and wharfage charges for the right to come to the docks to receive coal, particularly bunker fuel, but said that further hearings would be necessary to determine the reasonableness of such charges.

## Western Lines Want Increases

The Western railroads have made an announcement addressed to the public in which they explain what will apparently be their position at the hearing on their petition for an increase in revenue in Chicago, Sept. 8. The hearing of this petition is coupled with Docket 17,000, Hoch-Smith Resolution.

They point out that their earnings in 1924 were 3.87 per cent, and announce that an advance of 5 per cent in freight revenues based on the tonnage of 1924 will result in a net return of 4.62 per cent. Particular stress is laid on that clause of the Transportation Act which provides that carriers generally are entitled to a return of 5¾ per cent. They announce, however, that they do not propose at this time to demand the full measure of their rights under the law, but will ask for an increase of approximately 5 per cent.

Perhaps the most important phase of the announcement is the following statement:

"As a practical means of carrying this emergency program into effect, the carriers are proposing general advances in freight rates which approximate 5 per cent, maintaining established rate relationships. In the instance of certain commodities the carriers will propose, as a matter of expediency, that the percentage of advance be converted into one applicable in an equal amount to all rates. As a few illustrations: on grain they will propose a uniform advance equivalent approximately to 1c. per bushel; on coal, 15c. per ton; on clay, gravel, sand and stone, 7½c. per ton; on cement, lime and plaster, 20c. per ton.

## To Hold Hearing on Raise in Handling Charge

The Coal and Coke Committee, Trunk Line Territory, will hold a hearing at 11.30 a.m., Sept. 9 at 143 Liberty St., New York City, on a proposal by the Central Railroad Co. of New Jersey and the Lehigh Valley R.R. to increase the present charge of 13c. per ton for handling coal and coke through the companies' pockets at Easton, Pa., to 15c. per ton, and to increase the storage charge in such pockets of $1.85 per pocket per day or fraction thereof, to $2 per pocket per day or fraction thereof. The reason given for the proposal is to establish rates more commensurate with the service involved and for the use of these facilities.

## Illinois Rate Hearing Continued

In order to give the defendant railroads an opportunity to collect additional evidence the hearing before an assistant commissioner of the Illinois Commerce Commission at East St. Louis, Ill., on rates from inner group mines to East St. Louis, Ill., has been continued until Sept. 8.

Three cases are being heard. The first, brought by coal operatives, seeks a reduction in the present rate of 91c. a ton for coal shipped within a radius of 20 miles of East St. Louis. Another case is brought by coal operatives outside the 20-mile zone but within 60 miles of the city, while the third case is on behalf of the operatives of the state at large. The latter two groups are seeking proportionate cuts in freight rates.

Rates on coal from Kansas, Missouri, Arkansas, and Oklahoma mines to Lincoln, Neb., after Sept. 28 must be reduced to the basis of like rates to Omaha, the Interstate Commerce Commission ruled after considering a complaint of the Lincoln Chamber of Commerce.

## Obituary

**James Minds**, pioneer coal operator of the Houtzdale region, died suddenly at his home in Ramey, Pa., Aug. 10. Mr. Minds had been in failing health for several years but lately seemed to be much improved. Interment took place Aug. 12.

## Industrial Notes

The reported consolidation of the Weir Frog & Switch Co., of Norwood, Ohio, and the Kilby Frog & Switch Co., of Birmingham, Ala., was confirmed Aug. 9, by J. K. Lansdowne, vice-president of the Weir company. Mr. Lansdowne declined to give the details. For the time being both companies will continue under their present managements. It is proposed to organize a holding company with Oliver De Gray Vanderbilt, president of the Weir company, as president to operate both plants. The transaction will involve no cash, but will be a transfer of stock in both companies, the shareholders qualifying equally. Mr. Lansdowne intimated that the Weir company probably would have the controlling interest in the consolidated concern.

**R. L. M. Taylor** recently was appointed district sales representative of the New York State and eastern Pennsylvania territory, known as the Reading district, of the **Reading Iron Co.**

**T. V. Buckwalter**, who has been chief engineer for the **Timken Roller Bearing Co.**, Canton, Ohio, was made vice-president in charge of engineering at the July meeting of the directors of the company.

**The Uehling Instrument Co.**, Paterson, N. J., recently appointed two new Southern agents to handle its line of $CO_2$ recorders and other power plant instruments. They are John C. Candler, 315 Glenn Bldg., Atlanta, Ga., to cover Georgia, eastern Tennessee and the southern half of South Carolina, and Charles M. Setzer, of Charlotte, N. C., to cover North Carolina and the northern half of South Carolina.

## Coming Meetings

**Rocky Mountain Coal Mining Institute.** Summer meeting, Aug. 26-29 at Price, Utah. Secretary, Benedict Shubart, Denver, Colo.

**American Institute of Mining and Metallurgical Engineers.** 132d meeting, at Salt Lake City, Utah, Aug. 31 to Sept. 3. Secretary, H. Foster Bain, 29 West 39th St., New York City.

**Oklahoma Coal Operators' Association.** Annual meeting, Sept. 10 at McAlester, Okla. Secretary, A. C. Casey, McAlester, Okla.

**New York State Coal Merchants' Association.** Annual convention, Sept. 10-12, at Richfield Springs, N. Y. Executive Secretary, G. W. F. Woodside, Arkay Bldg., Albany, N. Y.

**Association of Iron and Steel Electrical Engineers.** Annual meeting at Philadelphia, Pa., Sept. 14-19. Secretary, John F. Kelly, Empire Bldg., Pittsburgh, Pa.

**National Safety Council.** Annual meeting Sept. 28 to Oct. 2, at Cleveland, Ohio. Managing Director, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

**Tenth Exposition of Chemical Industries,** Sept. 28 to Oct. 3, at Grand Central Palace, New York City.

**Electric Power Club.** Fall meeting at Briarcliff Manor, N. Y., Oct. 19-22. Secretary, S. N. Clarkson, B. F. Keith Bldg., Cleveland, Ohio.

**American Welding Society.** Fall meeting, Oct. 21-23, Massachusetts Institute of Technology, Boston, Mass. Secretary, M. M. Kelly, 33 West 39th St., New York City.

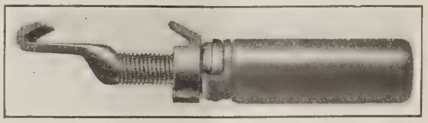
**Canadian Institute of Mining and Metallurgy.** Annual western meeting Nov. 3-5, Winnipeg, Manitoba, Can. Secretary, George C. Mackenzie, Drummond Bldg., Montreal, Que., Can.

**American Society of Mechanical Engineers.** Annual meeting at New York City, Nov. 30-Dec. 3. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

## New Equipment

### Adjustable Rail Clamp Makes Tight Ground Connection

Just as long as there are direct-current trolley wires in a mine there will be certain types of machines other than locomotives operating from them. Today we have direct-current drills, pumps, hoists, fans and loading machines connected to the trolley circuits.



**Makes Tight Contacts Possible**

This device makes it easy to get a good tight ground connection at a mine rail. It is provided with a cable-connecting lug into which the wire can be soldered.

To eliminate the difficulty and danger of making efficient connections to mine rails and to get a good return circuit for these machines, the Ohio Brass Co. has designed a rail clamp which can be easily applied to the rail.

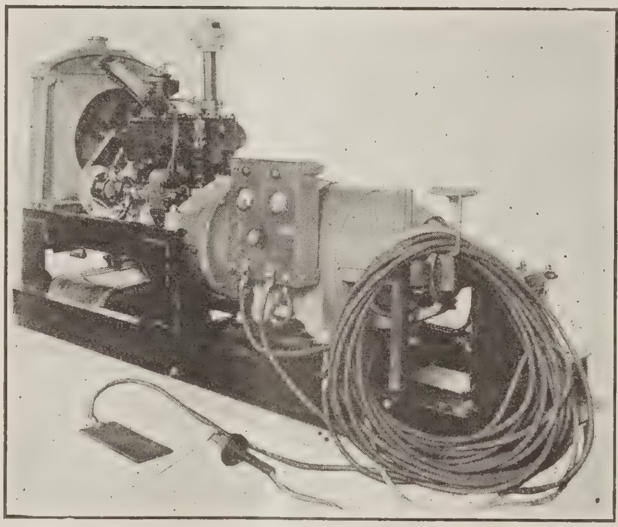
Best of all, this new clamp is adjustable and is provided with a handle for tightening it against the base of the rail. Two gripping hooks, one with a threaded bolt section and the other in the form of a threaded nut, clamp to the base of the mine rail. By turning the bakelite handle the hook or jaw which is made like a nut is clamped to the rail. This handle also is arranged so that it can be slipped back over the cable and the latter soldered into a lug formed in an extension of the threaded shaft. When the handle is slipped back into position it completely covers the soldered terminal and protects it and the end of the cable.

### Portable Welder with Gas Engine

A new engine-driven welding set recently was added to the General Electric line of welding equipment. This outfit consists of a standard WD-12 welding generator driven by a Buda engine, all mounted on wooden skids to facilitate moving from place to place.

The engine is a Buda model WTU, especially designed for heavy duty. It is a four-cylinder four-cycle machine of the L head type, with a 3¾-in. bore and 5⅛-in. stroke. The S.A.E. rating is 22.5 hp. at 1,400 r.p.m.; the actual brake horsepower is 33.

The new outfit is being marketed complete with all accessories and ready for use. This unit should be of value in locomotive repair work, in the construction of pipe lines and tanks, in repairs to mine equipment, or on any construction job where electric power is not available.



**A Complete Plant**

This 200 amp. welding outfit is driven by a 20-hp. gas engine. It is mounted on skids so that it can be moved to a position near the job.

## New Companies

**The Blount & Meredith Coal Co.**, capitalized at $10,000 has been incorporated at Cambridge, Ind. The incorporators are: T. A. Blount, W. T. Meredith, Wm. Griffith, A. A. Vance and Dwight McVicker.

**Saunders-West Collieries, Ltd.**, has been incorporated to mine coal and other minerals with head office at Calgary, Alta., and $150,000 capital stock, by Alexander Hannah, Orrin H. E. Might, Everett J. Chambers and others.

**The Delta Co.**, Ironton, Ohio, has been chartered with a capital of $50,000 to mine and deal in coal. E. S. Culbertson, Alice C. Culbertson, J. D. Davies, Miriam J. Davies and J. A. Rogers are the incorporators.

**The Kansas Line Mining Co.**, capitalized at $34,000, has been incorporated. The company is to buy, sell and lease and develop mines and mining properties. The incorporators are Frank R. Grant, W. G. Basinger and Val Hakanson.

**The Burgess Brand Coal Co.** has been granted a charter. This company has an authorized capital stock of $200,000, its general offices to be at Huntington, W. Va. Chiefly interested in the new company are Edward B. Raignel, E. E. Winters, G. C. Garred, M. R. Tetman and Louise Hart.

**The Carbonizing Coal Co.** of Canada, incorporated under the laws of the State of Delaware, has been licensed to do business in Canada on a capital stock of $40,000, and has appointed Emma E. Tait, of Toronto, as its agent.

## Will There Be a Strike?

EVERY INDICATION seems to favor a suspension in the anthracite region; nothing more clearly than the attitude of John Lewis, the leader of the mine workers. Another element that favors a suspension is the apparent determination of the Administration to keep hands off. It will do so doubtless unless the pressure from the public is too severe as seems likely.

Herbert Hoover has returned from California, and no action has been taken. It is believed that he advocates a policy of silent neutrality knowing well that any effort to bring moral pressure on either party will be construed as making any agreement that may be reached an Administration settlement, for which the executives, if they took any part, would be blamed and held chargeable if they did not provide for its execution.

Mr. Hoover's contention is that he did not outline the Jacksonville agreement in the bituminous field. The operators, however, felt the weight of the Administration's hand and made a settlement, the only one possible under the conditions. They were, they felt, told to buy and they bought—at the market price. As a matter of fact, as the record runs, they were not told to buy, but were merely told to go to market.

Still the fear was there, whether of the Administration, or of the people or of both together, and who shall say the fear of the Administration was not natural? Had not every prior Administration intervened and brought pressure to bear on the operators? Was this Administration to be an exception? Every sign pointed in the opposite direction. So they precipitately signed not for a short period but for three long years, with the unfortunate result that has been recorded again and again in these columns in all its continuous and harrowing detail.

For these reasons or others it appears that the Administration will not act. It is argued that to urge a settlement on the miners, even to advocate arbitration for them might be a source of condemnation later. Swampscott and Washington alike, are mute. Let us hope they will continue so and not weaken. If they know no cause or impediment why the issue should not be joined let them now declare it or be forever silent. For later even an arbitration commission may, like the British Government, not decide on justice and reason but seek any settlement that will tide over an unfortunate situation. It is to be feared that when the time comes and the silence is broken, it will be for an immediate fiat that the operators in the interest of an imperiled nation concede their right to conduct their business without loss.

The operators are advocating arbitration. They don't want a strike, because they don't want public disapprobation, because they have a clear case and because also they question whether a strike might last long and deplete the coal bins so greatly that the public would demand a compromise, with themselves the victims of their own pliancy to politics and popular clamor.

Victory, unfortunately, they must have. The recent freight decision makes that more necessary than ever. The new through freights are menacing even though they are framed for the good of the public and are in accord with a broad ethical policy of not restricting commerce. A strike, however, would give the low-volatile competitor a chance to displace the anthracite producer in the market, an opportunity to train the consumer in the use of a new fuel.

Continuous operation, with a reduction in wages by an arbitral committee would save the market for the anthracite miner and operator. But a compromise at present wages would be unthinkable. The operators have now more to battle for than ever, and it will make them less pliant than they might have been.

It was good of the Interstate Commerce Commission, whether by intention or without, to clear up the issue when it did. It might have delayed its orders till the operators had made an agreement without the decision in view. Coming as it does it removes an uncertainty, and the effect of the decision being delayed till Oct. 15 gives the operators that length of time, at least, to prepare the miners and themselves to act in the light of the decision instead of under its crushing burdens.

Alas! the miners do not weigh the future. They live wholly in the present, and it may take them some months or even years to get a true measure of the Commerce Commission's ruling and when they do it will be too late. The anthracite market will be "shot to pieces." The time to save the situation is now, but the miners cannot see it, and the union leaders do not dare to see anything but what the more aggressive union men in the anthracite region dictate.

## Why Not Apologize?

WHY SHOULD the Philadelphia *Public Ledger* in its editorial of Aug. 19 retail with glee the misfortunes of the anthracite operators and prophesy the time when the anthracite industry may be "as vital to the Nation as the toy-balloon business"? Surely it has been by continually increasing wages and imposing the dominion of the union that the anthracite industry has been restricted. It has been the custom of past administrations, politicians and public to impose burdens and then to slide from underneath them by buying coal which has not been so burdened. Some of the business has been lost to union coal it is true, but now it is about to go in large measure to non-union coal regions where wages are lower.

It would seem that the citizenry, and with it the *Public Ledger* should be disposed to apologize for having by unfair decisions, made for political reasons, ruined the anthracite business, but instead of that it yells its triumph. Its unfairness has destroyed the anthracite market, and it is happy.

Now if the anthracite industry is an unnecessary occupation it is surely not needful that it be scolded and regulated. Was the public right to insist that it sell these "balloons" at minimum profit and pay well for the manufacture of them? Now that the public knows that the burning of anthracite is merely a game at which only the foolish play, why not let the industry alone. Unfortunately we must continue the balloon-smashing business now we have started it, and one must question whether the administration will be able to make the public desist from its time-honored sport.

## Ordeal by Combat

A LEADING editorial in a New York daily opposes the immediate submission of the anthracite question to arbitration and says "the public cannot forever be made to bear the burden of the hard-coal mines' peculiar domestic strategy." It continues by suggesting that miners and operators should arrive of themselves at an agreement and that "this continual process of maneuvering what ought to be a technical question is not only inexcusable, it is also just a little tiresome." This same daily in past years has been in favor of arbitration of coal disputes, but that was when the strike or suspension, whichever it should be termed, had been long in destructive operation.

The coal industry has tried out the ordeal by combat with the union. It has had long strikes and the public has objected strenuously. The industry has been told in no equivocal terms that such combats must not occur again. So the operators call for arbitration and they are told now that their willingness to arbitrate is premature and that the public must not be bothered.

Let us take a glance back into history, where our prejudices will not be so strong as about present-day matters. Long ago when every dispute ended in a trial by combat or a personal encounter of a less well regulated character, the kings found themselves humiliated by their enemies and impoverished by the destruction of the nation's substance.

The kings did not like to bother with courts and juries and they tried to make their subjects cease their bickerings by a system of pressure which was based more on a desire for peace than a love of justice. But the fights continued. So long as there was only government interference without justice, there was combat. The ordeals and the hand-to-hand encounters ceased only when kings were willing to be burdened by the quarrels of their subjects. It might be "just a little tiresome" that these underlings sought justice, but kings must tire occasionally or be replaced by others not so negligent. And so they established courts, and more and more was left to the adjudications of the judges.

M. Jourdain, a bourgeois who once on a time desired to be instructed in literature, asked his instructor to acquaint him with a form of expression that was *"ni prose ni vers,"* neither prose nor poetry. Now, something like this is what some of the would-be pacificators are seeking, neither strife nor judicial determination. However, it is clear that men who have a quarrel must have one or the other means of settling their dispute. In this case it must be either a suspension (likely to be long and distressing for the issues are real) or an arbitration.

The public believes the courts should be ready to act before anyone is hurt, whether disputants or merely unoffending bystanders. So let us have the arbitration now, before the supply of coal has dwindled away, when we can act without excitement and without fear of a coal-less winter. Arbitrators are sometimes moved to decide through fear of consequences to the public rather than by the actual implications of justice. We are not sure that a little opportunism might not in times of dire national need rightly temper judgment.

The British Government has just settled its dispute between miners and operators by promising a payment of $100,000,000. That makes a Coal Commission costing $600,000 look relatively cheap. The British Ministry does not even try to defend the essential justice of its actions. It admits it is buying peace at the lowest merchantable price. So why should we delay if we want a right decision and not merely one which is obtained like that in Great Britain by buying out both parties?

## Rock Tunneling

MORE AND MORE the practice of driving rock tunnels in coal mines is increasing, because the relative cost of roadways of this type is decreasing, and it is found that such construction removed from mine operation is more permanent than a roadway would be if driven in a coal bed in process of extraction.

As for cost, there is a great saving from the use of loading machines which do the hardest of the work—mucking. With such a machine the miner is quite willing to remove yards where he formerly was content to remove only feet. With power drilling equipment he can drill holes with great speed and with minimum labor. By shutting off the tunneling from the rest of the workings the management can often operate the excavation as something apart from the mine and without being subject to laws framed to protect the operation of a going colliery and with better care for the health and safety of the workman.

Thus the operator can provide an air duct and a special fan that will clear away the smoke and waste gases of a shot or shots in a few minutes after they are formed, saving time and providing for their more perfect evacuation. Shots can be fired with delay fuses such as are used in metal-mine and railroad tunnels. Furthermore, the operator can avoid the dangers of a bad drawslate which make driving roadways in the coal hazardous.

Another advantage is that the operation of the mine is not interfered with when the tunnel is being driven. Extensive grading of mine roadways is a source of much annoyance when the mine is being operated, and the transference of rock clutters the mine roadway. It may be added that a tunnel in the rock saves extensive and costly timbering with all the dangers that accompany the use of such construction in coal.

One wonders sometimes that mines continue to be worked under all kinds of disadvantages as to haulage and drainage when a roadway might be driven that would be favorable to both. The idea of driving rock tunnels, however, is unusual enough to be regarded in many places as new. Yet the rock tunnel in many anthracite mines is used quite extensively, being found more permanent than roadways in the coal. Where the seam opens on the hill at an inconvenient level, a rock tunnel can sometimes be driven that will debouch at a level convenient to the top of the tipple. With all the modern equipment genius has invented and developed, the driving of a rock tunnel is not such a fearsomely expensive, slow and difficult job as it used to be.

# Examining Engineer's Work Plays Vital Part in Financing of a Coal Mine Property

## Earning Value and Not His Appraisal, However, Should Fix Actual Worth—Excess Rates Should Not Be Put Upon Coal Bonds—Outline Shows Items to Cover in Appraisal

**By John A. Garcia**
Consulting Engineer, Chicago, Ill.

CONFUSION EXISTS in many minds concerning sound financing of coal properties. Some of this possibly can be removed by considering the part which good engineering should play in aiding banker and coal operator to arrange properly the affairs of a producing company. They should realize that an engineer's appraisal shows the physical replacement cost, not the selling value, of a property. He should not be expected to overburden a mine with inoperative acreage merely to raise the total value in protection of bonds. The banker might profit by the judgment of the experienced engineer even in fixing other basic terms for mine financing. Everybody concerned ought to understand what an appraisal should cover, but reliance upon the engineer should not cease when that document is filed.

The word "appraise" is defined in the dictionary as—"to make an official valuation of, or to set a price on;" the word "value" means worth, and the word "worth" means, among other things, the market value. In business transactions an appraisal is ordinarily understood as a figure or price for which the property may be sold on the market.

However, since there is no open or regular market for coal acreage or mines an appraisal has necessarily come to mean something other than as specified in the dictionary, though this fact is not generally known and the appraised figure is often mistaken for the engineer's calculated selling price for the property.

An appraisal of the physical assets, as applied to coal mining, is the calculated replacement cost, depreciated for condition, obsolescence and mine life and, therefore, no true relation exists between the appraisal figure and the actual value or worth of the property as a money making business proposition, excepting in cases where the two totals check by coincidence. For example, a mine may appraise on a physical replacement basis at, say, $500,000, but can earn in normal times only $10,000 per annum, in which case the true value or worth of the operation on a 20 per cent earning basis is only $50,000 or one-tenth of the reproduction cost.

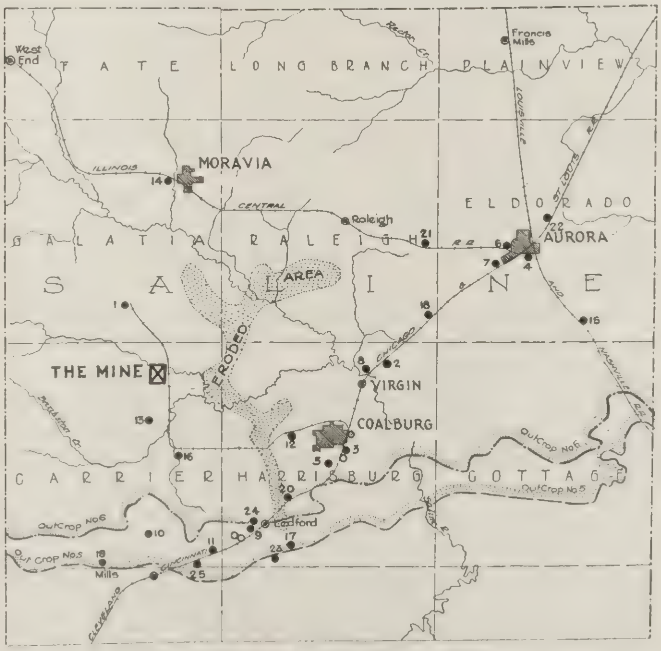
Misunderstanding of these facts has led bankers and operators, and especially promoters, into grievous errors in financing coal properties; the banker wants to see the total values high enough to protect his loan several times over but with unit prices low enough to permit of full coverage in event of forced sale under default, and the other side, having a fixed or limited property wants the unit figures high so that the total may reach the banker's requirements.

The engineer, striving to be impartial, is bedeviled by the conflicting interests, can satisfy neither side and the ethics of his profession, together with his duty to the investing public, often induces him to take the banker's viewpoint even though he knows full well that the additional acreage or property added to bring up the physical valuation will form a fixed charge and often a serious burden to the operator.

For example, a mine with an assigned acreage of proper size may appraise at $500,000 and have an actual annual earning record of 50 per cent on its valuation with assurance of continued performance, but to obtain a bond issue of $300,000 on such a good business proposition, the operator should own outright enough property to make the total physical replacement valuation approach $900,000. The carrying charges on the additional $400,000 is clearly a fixed burden to the operator and may be offset on his books only by a constant increase in the value of the acreage which may or may not accrue.

The banker's insistence on other so-called safeguards in addition to the forced-sale value is probably a wise precaution from his viewpoint while negotiating the loan, but, unfortunately, will ultimately bring about a direct overhead expense that may form a menace to the sinking fund or interest charge.

In most cases the mortgagor requires that approximately half the coal in the property shall remain unmined when the bonds are paid off, which seems quite unfair since the sinking fund applies to all coal hoisted and, therefore, if the output should become unusually large, the fund automatically increases and to the extent of such increase the basic security of coal in the ground



**Coal Field Map Is Worth While**

The location of the mine to be financed with relation to its neighboring competitors—each other mine numbered and named in the map's caption—together with other surface features such as the location of nearby towns and rail lines all help to make the appraisal complete.

is converted to cash in sinking fund. It is assumed, of course, that the available coal as calculated is, in quantity, sufficient to amortize the investment via the per ton rate.

Again, a mortgage may properly be placed only on fee simple acreage or mineral owned outright in order to be a first lien. Very often, especially in the midwestern field, the royalty rates on leased land are so low that outright purchase would mean a very bad business investment, but, nevertheless, the purchase must be made if the rights of the mortgagor are to be prior to those of the landlord. This matter becomes serious only when a large portion of the acreage or some particularly choice tract is a leasehold and in such cases the proper procedure, in my opinion, is either to acquire title or finance with stock rather than bonds, though it is possible some guarantee may be made by the lessor that will protect the bonds in event of default.

The duty of the engineer making an appraisal may possibly require that he furnish an analysis of the coal but hardly a statement as to its application to furnace requirements or a criticism of the quality, and such questions as personnel of management, contracts and revenue on tonnage, production costs, etc., are clearly outside the province of an appraisal. These items are, among others, of vital importance to any financial set-up so it may readily be understood how utterly valueless an appraisal of physical property is of itself in determining the true worth of a coal mine or its possibilities as a business proposition.

In my opinion the practice of rating coal bonds up one or two points above other industrials for interest and charging fifteen to twenty per cent for flotation is not fair, for either the issue is good and can stand up under microscopic examination with other industrial issues, in which event it should not be penalized, or it is not good and no reputable banker should sponsor it.

### Discounts Indicate Weakness

The argument that the sales resistance to coal securities necessitates such discounts and high interest rates appears fallacious to me, for any sensible investor would immediately become suspicious of a 7 per cent bond on a 5 per cent market, or a 95 quotation on a 100 par bond, either of which is indicative of weakness and is the very thing an investor or banker seeks to avoid so that the fact that the interest rate is over the normal or the bonds are quoted under par, actually increases sales resistance and pyramids the difficulties of marketing.

The hazards of the industry do not appear to warrant any excess rates on coal bonds, for good management presumes ample insurance including catastrophe, and if the operation is extraordinarily hazardous as to gas, fire, flood, etc. the load on first mortgage should be proportionately reduced or, again, the proposition is for stock rather than bonds. It is also true that a mine disaster that destroys the physical property beyond recovery is a rare occurrence. Usually the loss is in personal injury cases covered by liability insurance, as is the business loss when catastrophe insurance is provided.

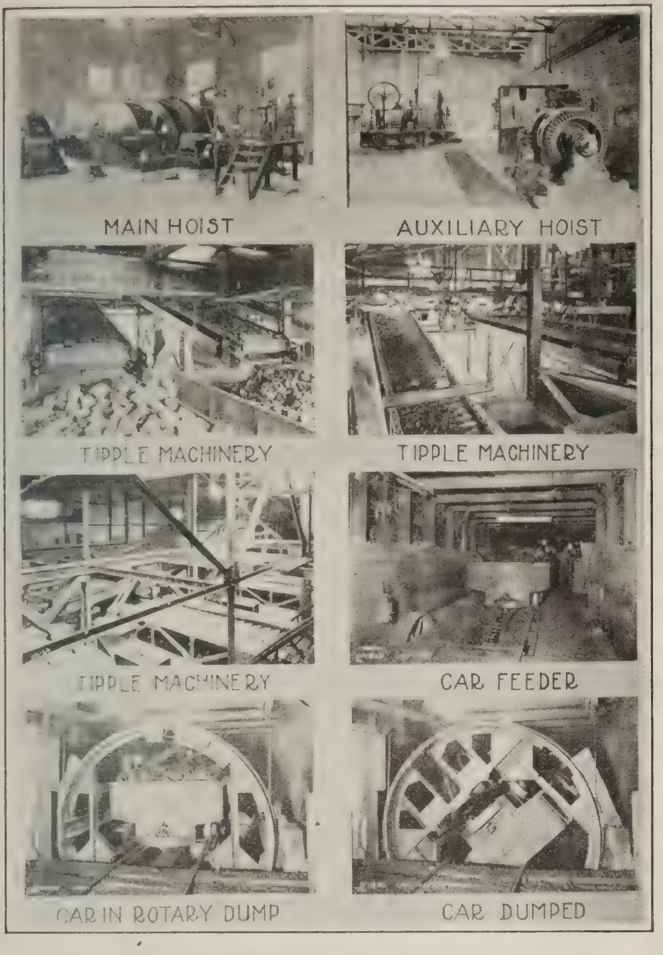
**An Important Feature of an Appraisal**

Anybody interested in financing a mining property can get a better idea of the character of it with the aid of photographs, properly arranged, than he can from the written report alone.

Should a report, an appraisal and an audit each reflect a safe and profitable coal operation—and this is the only kind on which a bond issue may properly be placed—the terms and interest rates should be in line with those of other industries. Because of seasonable demand and recurrent cycle of peak production every few years, serial bonds are not especially desirable, often proving to be a heavy burden in times of stress and a light load in flush periods during which it would be desirable to retire larger portions of the loan.

Although the history of an operation has a bearing on the set-up, too often this matter is given more consideration and importance than the facts warrant. An old and successful coal mine with a fine record may be much more of a risk than a new and modern mine with no earning record at all. The practice of including old and obsolete operations in a merger because of their earning record—"to sweeten the picture"—can be justified only when their first cost is more or less nominal or their acquisition by merging interests permits of reduced strain in competition for marketing the output, thereby tending toward elimination of suicidal prices and unnecessary production.

The appraisal of the physical property is essentially an inventory with prices and usually there should be two sets of figures for each item: First, the present-day cost and, second, the depreciated replacement cost, though the latter is sufficient if the percentage of depreciation is shown, excepting in cases where the replacement cost new is desired. The field work, though mainly clerical insofar as taking inventory is concerned, calls for expert knowledge of all classes of equipment and structures as used at coal mines to note intelligently the amount of deterioration and, especially, obsolescence. The notes must always give governing dimensions of



**How Well Equipped Is This Mine?**

This important question, always asked concerning a coal property about to be refinanced, is only partially answered if the appraisal does not contain clear photographs of the machinery and equipment.

buildings, as well as specifications and concise notations that will aid the office in calculating values.

Detailed inventories of all buildings, equipment and miscellaneous improvements are, of course, taken in the field and the mines entered and inspected to determine the thickness and characteristics of the coal seam. The present condition and age of all items is noted to be used in fixing the percentage of depreciation.

All items are figured for replacement cost as of the current date and are depreciated according to the conditions in which they have been maintained, due allowance being made for obsolescence and number of years in service. On the permanent buildings, equipment, shafts, slopes or drifts, the depreciation is further adjusted to give effect to the ratio of acreage depleted to assigned acreage.

In arriving at replacement cost, the market price of labor and material prevailing in the district where the plant is located is used to determine the cost of each item in place. Throughout the appraisal the "Replacement Cost" of the detailed exhibits in the summaries includes all expenses for tools and labor required to furnish each item in place, including contractors' contingencies and profits as of current date. To this cost a percentage varying with the different classes of work is added for expense of organization, engineering and incidentals.

The item of "Organization" includes such cost as general office expense, obtaining bids, awarding contracts, bills of material, purchasing material, salaries of officers chargeable to construction and legal expense chargeable to construction.

The item of "Engineering" includes cost of preparation of plans, drawings and specifications, together with expense of general supervision and inspection required in carrying out the plans and specifications.

"Incidentals" cover all general expenses that lie outside of contracted cost, such as might be included as extras on the contract price. These may be due to small changes in design, to interference with construction from various causes, such as strikes, uncertain foundations and to insurance against fire and accidents. The aggregate of these percentages vary according to the class of work.

These percentages are added to the subsummaries and the total represents the cost to the company of the property detailed in the exhibits.

Development includes cost of yardage, construction of the shaft bottom, and of room necks in "live" territory (usually between inside partings and working faces), and carrying charges during construction for a period of two to four years while opening the mine, including taxes, interest, and legal expenses.

Mineral rights owned are valued on "going value" of similar blocked-out acreages in the field, and leased acreages on the differential between the value of leases in connection with property and present "going royalties" in the field.

The additional labor involved in making an appraisal equivalent to an accurate inventory is well justified by the uses to which such a record may be put, for it may then be the official record for the purchasing agent in replacing or duplicating parts, for the sales department in the matter of sizes and preparation equipment, for the auditor for adjustment of fixed property value on the books, for the fire, tornado and other insurance policies, and the like. The best evidence of good field work by an engineer is a set of notes that can be readily interpreted by the office force without contact or explanation by the man who took them, but because of the number and variety of items in a coal mine inventory it is best to have the field men at least aid in the office calculations.

### Include Photos of Property

Small photos of the buildings and structures should always be taken, as a picture gives at a glance the character and type of the plant and permits of prompt general classification of the property. These photos should be neatly grouped and reduced down to not more than eight pictures to a standard sheet. Clear titles or descriptions should be written on each.

A map of the property should always accompany the appraisal and should be drawn on a scale small enough to permit of ready reference. A large-scale map is unwieldy and sufficient data usually can be incorporated in a neat, small drawing. These maps should show location of buildings and structures with governing dimensions (especially for fire insurance records), the surface owned and leased, the mineral rights owned and leased, worked-out area, etc. and if more than one workable seam is present it is often desirable to have a separate map showing property rights for each seam.

The replacement cost of equipment and development is simply a matter of calculation and reference to data sheets or files for unit prices. For check, the totals should be compared with similar items in other appraisals. If the engineer handling the work has no accumulated data or cost records on coal-mine equipment, it will be exceedingly difficult to place prices on the innumerable items entered on the inventory sheets, and though it is, of course, possible to obtain the information from the various manufacturers, the time and cost of such a laborious search generally rules out the unequipped engineer from this class of work unless approximate figures will suffice.

The valuation of underground development, entries, headings, etc. is a much disputed question, but in the absence of any standard or fixed formula for determining a fair value for this important item in the appraisal, it is my custom to credit the mine with the reduplication cost of the mine bottom, the partings, the advanced development inside the partings, and any item of construction that fairly and properly can be charged to capital account rather than operation, and then depreciated according to condition and mine life.

The rail, trolley wire, pipe, etc. between mine bottom and parting is given a depreciated replacement value but no credit is allowed for haulage roads or air courses between these two points on the theory that their very existence forms a penalty to the operating costs when considering replacement values for comparison with a new mine in virgin acreage. This method may not be scientific but it gives a fairly accurate figure on the cost of replacing the existing workings with an operation developed for the same output.

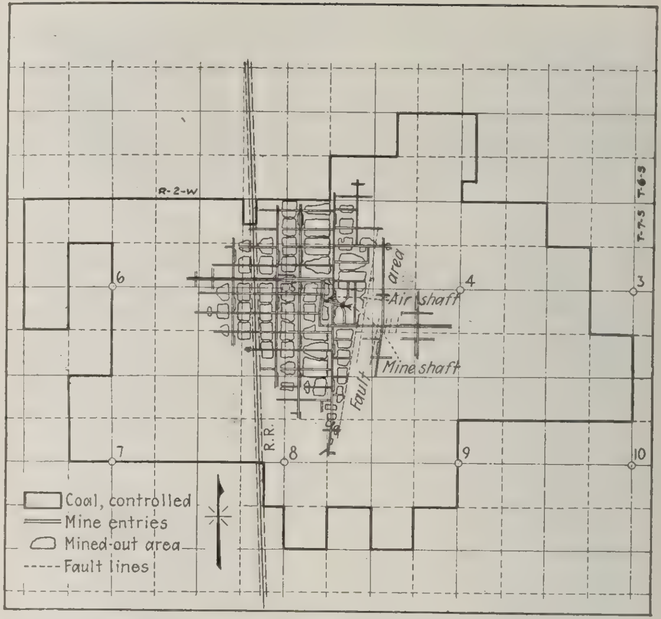
The acreage or mineral valuation is usually the most difficult part of the whole work. The variation of a few dollars per acre or a fraction of a cent per ton of coal in the ground may be sufficient, in a large tract, to wipe out the total replacement cost of the improvement, and there are so many theories of valuation of available mineral that a veritable maze of problems confronts the engineer in his efforts to absorb, consolidate and reduce to definite terms the demands of the conflicting interests and alleged authorities on this question.

### Should Establish Replacement Cost

However, if the engineer will only keep clearly in his mind the fact that his main effort is to set up a statement of replacement cost, the problem is reduced to its simplest terms and his value per acre automatically is placed at the going value of similar coal land in the field, and the price of land as established by recent deals becomes the basis of his calculations which are adjusted arbitrarily for local or special considerations.

On leaseholds it seems fair to base the values on the differential between the going royalty of the field and that specified in the lease, and if there is no differential it is the writer's custom to give no credit to the property for leased coal—always remembering that the appraisal is a replacement proposition and not a statement of value based on earning capacity which is an entirely different thing.

Accompanying every appraisal there should be a valuation as established on a basis of safely anticipated profits, capitalized on about a seven per cent annual dividend and refunding capital by reinvestment of a sinking fund at four per cent. This statement, when conservatively worked up as to days of operation, annual output and profit per ton, either assumed or determined from past records, provides a check on the physical value of the property and gives, under fixed assumptions, a good idea of the possibilities of the proposition from a business viewpoint.



**Relation of Mine Workings to Property**

This typical map, a valuable part of any good appraisal, indicates the size and location of the underground workings, some of the local geological conditions, the boreholes on the property, the location of the railroad that serves the mine, the surface boundaries and the like.

The capitalization of anticipated profits is merely the calculated worth of the business as an investment at seven per cent or ten per cent or whatever one may consider a fair return on his money. The engineer first finds the total available tonnage, assumes a fair running time, an annual output, and figures the life of the operation. With this basic data and an assumed profit per ton he may calculate the annual dividend and establish therefrom by reference to tables, if desired, the present worth of such a dividend.

If the assumptions as to output and profit are correct this method determines the true worth of the operation, and the replacement cost is merely a check to find the approximate amount of money necessary to establish a business that would provide similar ultimate financial returns.

The theory of zoning mineral rights available to existing operations and establishing values per ton or per acre on a sliding scale adjusted to time periods of extraction has no place in the scheme of things when replacement cost is considered, but is properly applicable to a set-up on a company's books for the purpose of scientific amortization of property, since the zone of the coal seam being worked at present is apparently of greater value to the operator than the coal in the zone ten years later.

The word "apparently" is inserted above to avoid committing myself to this theory which is provocative of much discussion and many seductive arguments. Space limits the elaboration or analysis of the zone theory as applied to coal land valuations.

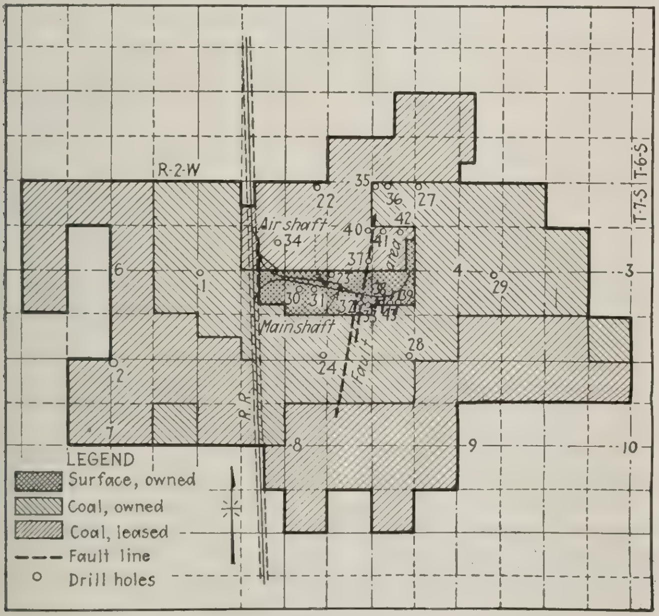
The logical answer to the various objections to appraisals forming the basis of a financial set-up is to provide an engineer's report which shall set forth clearly, fearlessly, and conservatively the governing, as well as the smaller factors that have to do with the operating and business phases of the proposition. Also an audit of the books should be prepared by auditors skilled in this special branch of industry. The auditor should be able to understand and appreciate the effect of war years and of "fat" but short contracts on the record of earnings, and so arrange his report as to reflect, if possible, the conditions of the business in normal periods. The engineer, if qualified for such service, will be governed in his analysis by normal conditions rather than either the subnormal or the exceptional.

Accuracy and knowledge of where to find the pertinent facts in the records, as well as ability to set them out properly in his report is the province of the auditor, for his work is mainly mechanical or clerical, insofar as this part of the job is concerned. He should not be expected to submit constructive criticism on the proposition as a whole as deduced from the figures on his balance sheets, for this requires a detailed knowledge of the operation which he, in all fairness, should not be expected to possess and is, without question, the obligation assumed by the engineer in accepting the commission of making a report.

### Engineer Should Accept Responsibility

A mining engineer's report has to do with any and all factors entering into the problem as a whole. The summation or conclusions in the report are often the only part read by the banker. This section should be clear, clean-cut, brief and free of qualifications. If it is possible, the engineer should say "yes" or "no" and accept responsibility. In other words, the engineer should either accept or reject, for the proposition is either good or not good from the viewpoint of an investor in bonds. There is no middle ground, for the first consideration of a mortgage is security and if any gambling element is introduced into the scheme of things, a bond issue should be automatically ruled out.

Engineers' reports on coal properties, if made in connection with a proposed bond issue or for sale and purchase, must of necessity cover almost every conceivable angle of the operation and, of course, no influence or prejudice of any kind whatsoever should affect or color either the statistics, recommendations, criticisms or remarks. The report on a mine should read alike for the buyer or seller and should be in its essence simply a statement of facts and conditions as found, together with an honest, unbiased analysis of the proposition in whole and in part, and a definite recommendation as to the main question if that is possible.



**Typical Property Map**

The engineer's appraisal should be accompanied by a good many illustrations like this, to show readily some of the main features of the proerty. This one, for instances, shows the surface owned, the coal owned and leased, a fault line that crosses the seam, drill holes, etc.

There is no reason why the engineer should confine his investigations and remarks to the purely technical or statistical phases of the work; in fact, there is every reason why a competent consulting engineer must not, and it should be both his privilege and his duty to adjudge the operation from the commercial angle, as well as the engineering. Often the physical property rates high in the scale of factors that make up the measure of the true worth of a mine, but because of high freight rate, lack of markets, labor shortage, over-production in the field, or other causes generally considered outside the province of a strictly engineering report, the operation may be hopeless so that any phase of the problem that affects the final answer of "yes" or "no" must be considered and weighed.

Investigations and reports that have to do with operating matters, efficiency, safety, the system of mining, fires, explosions or any of the different phases of mining are problems requiring special treatment and handling in each case. Although there may be some attempt at standardization as to the form of the report, there seems to be no such necessity as obtains in reports for the purpose of making a loan or a purchase. The maximum of pertinent data in the minimum of space should be the aim of the engineer in writing up his report and since it is read, as a rule, by those not versed in technical language, he should express himself clearly and simply so there shall be no ambiguity or possible misunderstanding.

### Summary of Report Important

The summary or recapitulation of the report is the bead of the assay and should be recorded only after a thorough and careful analysis, for the conclusion reached by the engineer should be the result of conscientious study of the problem at hand joined up with his judgment as obtained from good experience and expressed in definite terms and clear language.

The following structure is suggested as the framework for a report on a coal mining property, and its elaboration "up" or "down" is a matter of the requirements of the individual case and the judgment of the engineer. The schedule is submitted as fairly representative of the data required for what is known as a complete report but, of course, may be condensed or briefed if the client seeks information or advice only on specified items or sections. This entire structure should be completed in cases of purchase or sale, not only for protection of the engineer himself but for information of all concerned:

**Outline of Report on Coal Property**

*A—Location:*

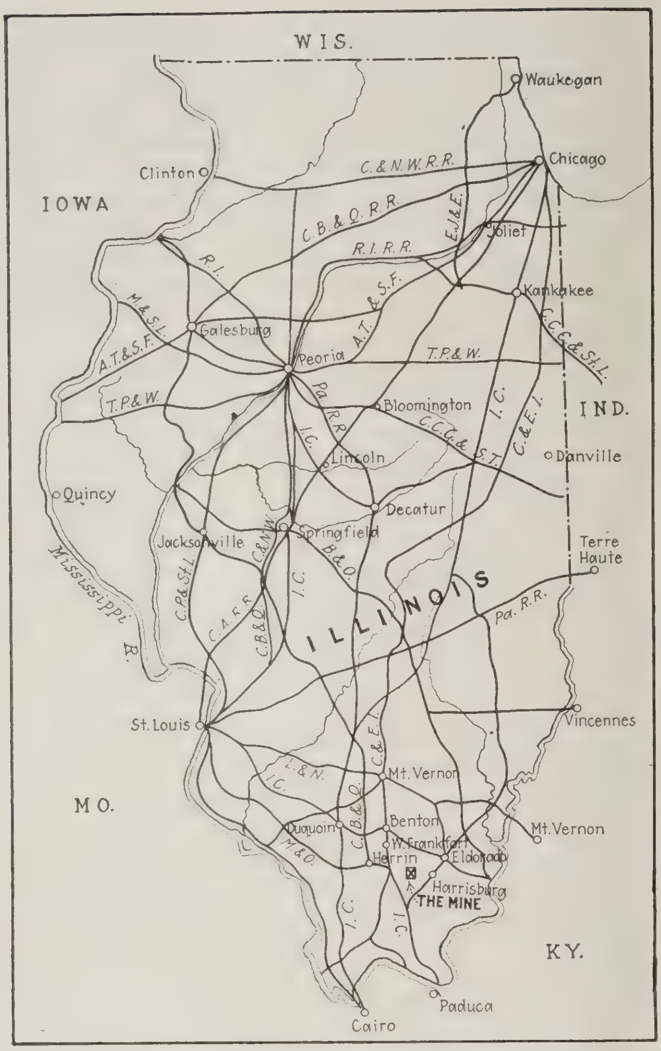
1. (a) Name of company, (b) geographical location, (c) coal field.

2. (a) Topography, (b) railroads serving property, (c) towns furnishing labor supply.

*B—Financial structure:*

1. When organized and under laws of what state.

2. Total capitalization: (a) Par value of common stock, (b) par value of preferred stock, (c) amount of each outstanding, (d) amount of each unissued, (e) bonds or other



**The Relation of Mine to Market**

This type of state map, which should always accompany a coal mine appraisal, shows at a glance the geographical relation of the property to its principal markets and its rail outlets.

securities issued and date of maturities; amount outstanding; amount in treasury.

3. Names of officers and directors.
4. Balance sheet to present date and copy of last certified accountant's report.
5. Contracts or commitments, if any.
6. Statement of contingent liabilities, if any.

*C—Acreage:*

1. Map showing mine property; also mine workings.
2. Acreage assigned to mine, separated into "owned" and "leased." If more than one mine, acreage assigned to each operation.
3. Additional acreage available, if any.
4. Unassigned acreage, if any.

*D—Coal seams:*

1. General geology of the district.
2. Description of each seam underlying the property: (a) Drill records, face sections, etc., showing roof, thickness of seam, floor; also persistent streaks or bands of impurities. (b) The lay of the seam; i.e., level, rolling, or pitching. (c) Gaseous or non-gaseous. (d) Wet or dry.
3. Analyses of face-cut samples; if possible, from four sides of mine workings, especially from sections in which the mine will operate during the greater portion of its remaining life. Also representative analyses of prepared sizes, if available with percentages made.
4. Purposes for which coal is adapted—coking, gas, domestic, steam.

*E—Recoverable coal:*

1. Tons of coal per foot per acre in place.
2. Percentage recovery, past mining and in field.
3. Probable recovery, tons.
4. Possible additional recoverable, tons.
5. Total recoverable tons remaining.

*F—Life:*

1. Yearly tonnage, days operation, and number of tons per loader and per day man employed for past five years at least.
2. Present average daily output and capacity tonnage.
3. Life of mine based on 200 days' active operation per year and average tonnage per day now being obtained.
4. Same data on maximum tonnage for which equipment is designed.
5. Same data on average running time of mine and field.

*G—Description of plant:*

1. Top buildings: (a) Type, suitability.
2. Top equipment: (a) Preparation plant, (b) Power supply, (c) Haulage and hoisting, (d) Ventilation, (e) Shops.
3. Type and size of opening; i.e., shaft, slope, drift.
4. Shaft bottom, size and layout.
5. Haulage: (a) Weight and width track, (b) Size and type mine cars, (c) System of haulage; i.e., trolley locomotives, storage battery locomotives, mules, horses. (d) Location of partings. (e) Grading.
6. Mining: Pick or machine; type of machines.
7. Loading: Hand or mechanical.
8. Underground power system.
9. Underground pumping system.

*H—Underground mining system and conditions:*

1. System of mining: Room-and-pillar, panel, longwall, combination of these or special layout.
2. Dimensions: Height and width of entries, chain pillar, barrier pillar, rooms, and number of rooms per panel or section.
3. Method of supporting roof: (a) Entries; (b) Rooms; i.e., props, cross-bars, pack-walls, cribs, top coal.
4. Ventilation system: Air courses, stoppings, overcasts.
5. Development: Scattered, systematic, adequate.
6. Safety provisions: Compliance with state laws; manways; refuge holes marked; condition of entries; sprinkling system; rock dusting; first-aid stations; type of lamps. (Note last report of state mine inspector.)

*I—Labor:*

1. Wage scale. Premiums above scale.
2. Actual number of employees and their classifications.
3. Housing facilities.
4. Class of labor available.
5. Can labor be handled more efficiently?

*J—Mine costs:*

1. Itemized monthly cost sheet, (actual and assumed*).
2. Itemized operating day cost, (actual and assumed*).
3. Itemized idle day cost, (actual and assumed*).
4. Itemized supply cost.
5. Itemized mine office and expenses.

*Assumed—based on knowledge of results obtained in efficiently operated mines in same or similar fields.

*K—Freight rates and car supply:*

1. Freight rates to principal markets and from competitive fields to same markets.
2. Discuss car supply of mine and field.

*L—General questions:*

1. Is the controlled coal acreage so situated as to be economically mined from the present openings and tipple?
2. Is the equipment, inside and outside, adequate, efficient and well maintained? If not, itemize necessary additions and approximate cost.
3. Can present production be maintained over a period of years without major expenditures? If not, itemize and estimate cost.
4. What limits output at this property?
5. Is coal preparation equal to that of competitive mines?
6. Is the physical condition of the coal seam, roof and bottom favorable to economical mining?
7. Are haulage roads, air courses and other underground elements in good condition?
8. Are there any fires, squeezes, areas of standing gas or water or other abnormal conditions present in the mine, and have any such conditions been encountered in the past?
9. Is the mine and local management experienced, capable and progressive?
10. In your judgment, is the quality of the coal, cost of production and freight rates such that coal from this mine can be profitably marketed in competition with coal from other mines in the field and in competitive fields?

*M—Summation:*

Criticism, suggestions and recommendations.

# Learning the Bottom Facts in Indiana

By J. H. Edwards
Associate Editor, *Coal Age*,
Huntington, W. Va.

KNOWING DEFINITELY, "what is on the bottom," before building the permanent top works is of great advantage to any coal operator. Especially is this true in this period of revolutionary changes in mining methods. An example of "proceeding with caution" is furnished by the development of the new King mine of the Princeton Mining Co., located about three miles south of Princeton, Ind. Although this development is designed for an ultimate capacity of 4,000 to 5,000 tons per day and thus will be one of the largest operations in the state, up to the present it is what might be termed an experimental mine. All loading is being done mechanically, four different makes of shoveling machines being now in use.

The shaft of the King mine is the deepest in Indiana, having a total depth of 439 ft. The coal mined is the No. 5 bed, lying under gray slate, and is of comparatively high quality. The measure worked averages 8 ft. in thickness and is free from partings. These features together with the fact that about 4,000 acres of this coal is available brings the King mine into prominence among the coal-producing enterprises of the state.

This mine was opened in August, 1923, but on account of the market conditions prevailing no attempt has been made to increase the production rapidly, although entries have been driven with rapidity. In the first six months of this mine's operation over six miles of entry was driven, not including breakthroughs. From this length of entry only a few rooms have been turned, or only enough to afford experimental working places for certain of the loading machines. The mine is under the management of Robert J. Smith of Terre Haute who several years ago managed a property of the Deep Vein Coal Co. near Princeton.

The headpiece accompanying this article and also Fig. 1, show recent views of the topworks of this mine. The only buildings of permanent construction are the hoist house, bath house, and fan. It is the intention to replace the present steam hoist with an electric machine when it becomes desirable to increase the production of the mine beyond the capacity of the existing equipment. The present tipple is highly temporary in nature but is fitted with shaker screens, and loads on two tracks. Alongside it is an elevated bin for storing that portion of the coal that is retailed direct from the mine.

Visitors are impressed by the fact that the King mine is being developed on the four-entry system, which is a decidedly uncommon plan of development in Indiana. The main entries are being driven along a line upon which test holes indicate that the bed gradually dips. The grades, however will be slight, for, generally speaking, the coal lies in a horizontal plane. The mine is gassy, but not to such an extent that it has been considered necessary to prohibit open lights in all sections, nor to prohibit the use of the ordinary types of electrical equipment.

## MACHINE LOADING THROUGHOUT

Four makes of loading machines are used in this mine, and no hand loading is being done. Altogether there are six machines installed, four are on narrow work and two in rooms. An idea of the production attained per machine may be gained from the April tonnage record. During that month only five machines were in use but the average daily output of the mine was 452 tons.

The last machine was installed so recently that no figures covering its performance are available. This machine, an Oldroyd, is shown in Fig. 2. This photograph was made as the loader stood on the supply track

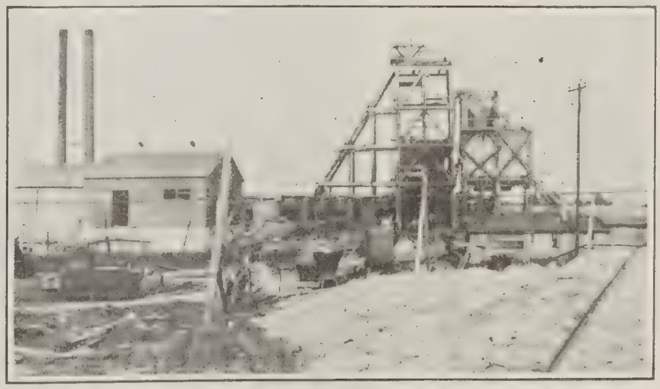


**Fig. 1—The Deepest Shaft in Indiana**

The officials of the King mine will "know what is on the bottom" before the permanent topworks are built. A steam hoist is now handling the output but it is planned to replace this with an electric hoist when the time comes for installing permanent, high-capacity equipment.

---

The headpiece shows the King mine of the Princeton Mining Co. It is destined to be one of the large producers in Indiana. It is located three miles south of Princeton, and as yet is in the development and experimental stage. The only permanent structures are the hoist house, fan, and wash house. The latter is seen in the extreme right of the picture.

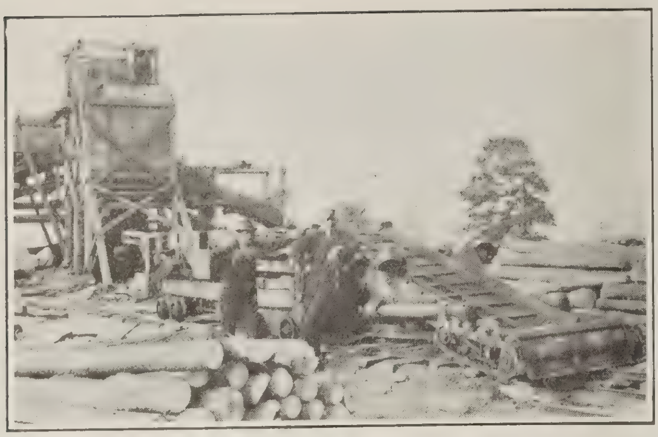

**Fig. 2—An Oldroyd Loader Going in for Trial**

Bruce Jeffers (left) and Bruce Rogers, superintendents at the King mine, have a few ideas of their own regarding mechanical loading. Their conclusions are based on actual experience with four types of machines.

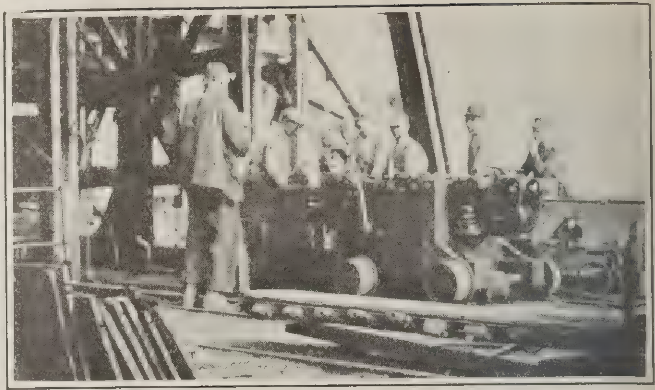

**Fig. 4—Moving the Oldroyd Cutter onto the Cage**

This machine is now used in conjunction with a loader of the same make. The cutter bar and its supporting goose-neck have been removed in order to get the machine onto the cage. The main body of the machine resembles a locomotive but the trucks are placed at one end in order to balance the goose-neck and cutter bar.

the day before it was taken apart and lowered into the mine.

An Oldroyd cutting machine is used in connection with this loader. Preparations for lowering the cutting machine into the mine are shown in Fig. 4.

Two Joy, type 4BU machines, were the first mechanical loaders to be put to work in the King mine. Since August, 1924, these machines have been operated two 8-hour shifts per day in entry driving. Fig. 3 shows one of these machines at the face waiting for the locomotive to spot an empty. Two men compose the operating crew: the other two shown in the picture are the inside superintendent and the fireboss.

It has been found that a Joy machine of this type will load an average of 22 cars or 66 tons per 8-hour shift, in an entry 10 ft. wide. About 18 in. of top coal is left to protect the roof in all entries. The production of 66 tons means that the machine must be moved four or five times during each shift. In one instance one of these loaders advanced an entry 35 ft. in a single shift.

Fig. 6 shows one of the two Jeffrey pit car loaders that were installed in October, 1924. Three men make up the crew of this machine. Three men shovel coal from the face onto the conveyor, but a considerable portion of one man's time is required to trim and spot the cars. The tonnage loaded by this machine depends entirely on the energy and initiative of the crew, inasmuch as the coal must be moved onto it by hand. Contrasted with the Joy machine the operating expense of the Jeffrey is much less, but the labor cost is roughly 50 per cent more.

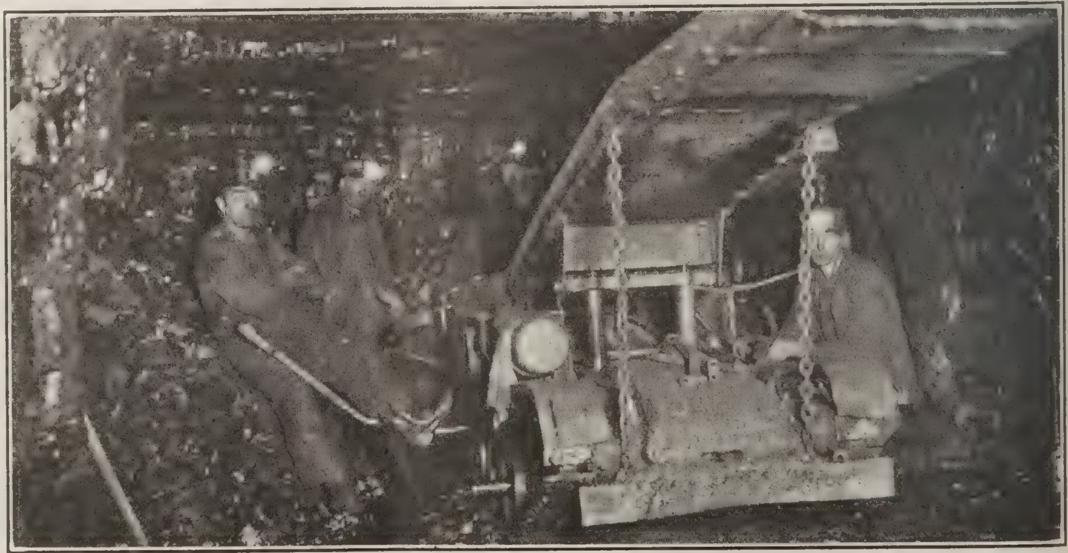
The fourth type of loader used in this mine is the Myers-Whaley. One of these machines was put to work in December, 1924. When the photograph, Fig. 5, was made the machine was working at a narrow point in a room where it crossed under a railroad. Rooms where this machine is regularly employed are 30 ft. wide and are driven 250 ft. long. Such places are double-tracked to facilitate the handling of cars. The full thickness of bed is taken in the rooms, no top coal being left. One cut 6½ ft. deep yields about 60 tons. Two men make up the machine crew. At present only one locomotive tends the loader, which limits its average production to 80 tons per shift. It is estimated that if two locomotives tended the machine, other conditions remaining the same, production could be increased to approximately 140 tons per shift. The conditions under which this Myers-Whaley loading machine is operating are experimental, and its present performance is not truly indicative of its capacity under more favorable circumstances.

One disadvantage of mechanical loading is the decreased efficiency of the mine cars, which results from the smaller loads carried. It has been found at the King mine that cars which, with hand loading,

FIG. 3

**Driving Entry**

This Joy type 4BU machine loads 66 tons per shift in a 10-ft. entry. Two men operate the loader. The other two in the picture are the inside superintendent and the fire boss. In this picture the machine is stopped and the crew waiting for the locomotive to spot another empty. Such delays limit the production but are inevitable in narrow work where the mine cars are brought to the face.



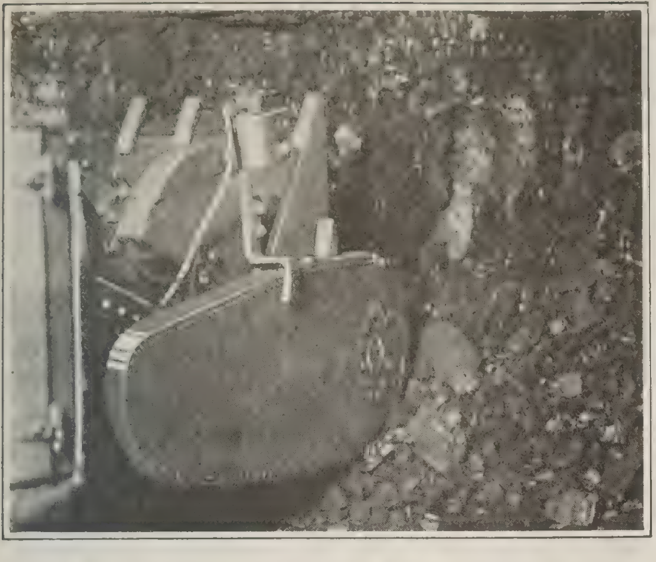


Fig. 5—"Business End" of the Myers-Whaley Loader

This machine is operating in 30-ft., double-tracked rooms. Here all of the 8-ft. bed is taken out. This loader is designed as a high capacity machine but on account of the experimental conditions and because but one locomotive is available for handling its output, the production averages only about 80 tons per shift.

averaged 4½ tons are averaging only about 3 tons when machine loaded. The effect of this decreased loading of the mine car is offset to some extent by the decrease in the length of time that each car remains at the face.

Apparently the officials of the Princeton Mining Co. are making the best of the present period of light demand for coal, to develop territory and to ascertain definitely what type of loading machine and method of mining are best suited to the local conditions encountered. When the time comes for building a permanent tipple and standardizing on loading methods they will have available a wealth of facts for their guidance.

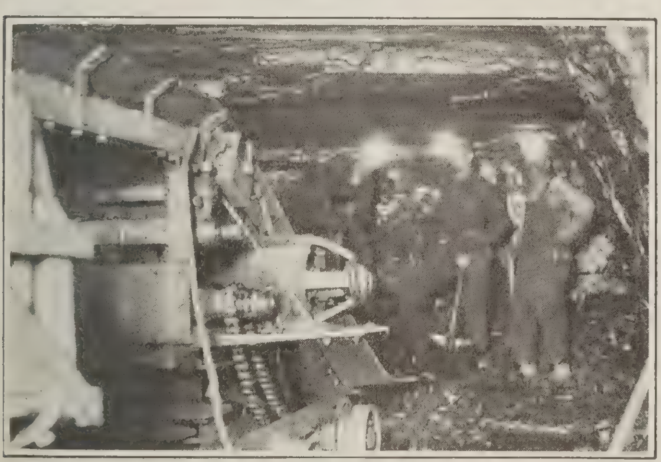

Fig. 6—Jeffrey Pit-Car Loader in Use

The coal averages 8 ft. in thickness and has no parting. Eighteen inches to 2 ft. of top coal is left in the entries to protect the roof. Three men make up the crew of this machine. Ordinarily two of them load coal onto the conveyor while one trims the car.

## Nebraska Has a Producing Coal Mine

More than thirty years ago it was known that Richardson County in the extreme southeastern corner of Nebraska, had some coal deposits, but little attention was paid to the deposit. Twenty-eight years ago a man named Cutler opened a mine near Rulo, Neb., but gave up the project when water began to seep in. Another man while digging a well accidently dug through a bed of coal.

About a year ago when C. Lewis inherited the Thomas G. Broker estate he opened up a mine, thus proving his farm to be underlaid with a strata of marketable coal. Since that time Mr. Lewis has incorporated a company and four miners have been working there since November, 1924. About 500 tons of coal have been taken out.

The mine is one and one-half miles from Kansas and one mile from the Missouri line. An analysis shows that the coal has 12 per cent of ash and 11,222 heat units to the pound.

## Rock Dust Now Used in 62 Pennsylvania Mines

The rock-dusting of coal mines to prevent explosions of dust or to limit their intensity has within the past year made a tremendous advance in the country at large and in Pennsylvania particularly. A year ago there were only four mines in Pennsylvania that had been subjected to treatment by this method; now there are sixty-two with others soon to be treated.

The Federal Bureau of Mines at least fifteen years ago made many practical tests of the method at the experimental mine at Bruceton, Pa., and demonstrated its value. A number of rather disastrous explosions in various sections of the country during the last three or four years has brought the subject again into prominence, and the Pennsylvania department of mines took the matter up with the district mine inspectors and began an intensive campaign among the operators. As a result great progress has been made in the last year.

The list of Pennsylvania mines now rock dusted follows:

| District | Company | Mine | County |
|---|---|---|---|
| 1 | Pittsburgh Coal Co. | Montour No. 10 | Allegheny |
| 1 | Bethlehem Mines Corp. | Mine No. 58 | Washington |
| 1 | National Mining Co. | National No. 4 | Washington |
| 1 | Ontario Gas Coal Co. | Ontario | Washington |
| 16 | Maryland Coal Co. | Maryland Shaft | Cambria |
| 13 | Springfield Coal Mining Co. | Springfield No. 1 | Cambria |
| 13 | Pennsylvania Coal & Coke Corp. | Ehrenfeld No. 3 | Cambria |
| 14 | Pittsburgh Plate Glass Co. | Creighton | Allegheny |
| 15 | Barnes Coal Co. | Lancashire No. 14 | Cambria |
| 15 | Pennsylvania Coal & Coke Corp. | Pennsylvania No. 18 | Cambria |
| 16 | H. C. Frick Coke Co. | Palmer | Fayette |
| 16 | Republic Iron & Steel Co. | Republic | Fayette |
| 6 | Hecla Coal & Coke Co. | Isabella Nos. 1 and 2 | Fayette |
| 16 | Eastern Coke Co. | Tower Hill No. 1 | Fayette |
| 16 | Tower Hill Connellsville Coke Co. | Tower Hill No. 2 | Fayette |
| 16 | Thompson Connellsville Coke Co. | Thompson No. 2 | Fayette |
| 16 | Orient Coal & Coke Co. | Orient | Fayette |
| 17 | Pittsburgh Terminal Coal Corp. | Pittsburgh Terminal Nos. 3-4-8 | Allegheny |
| 17 | Pittsburgh Coal Co. | Montour No. 4 | Washington |
| 19 | Westmoreland Coal Co. | Criterion | Westmoreland |
| 19 | Westmoreland Coal Co. | Adams | Westmoreland |
| 19 | Westmoreland Coal Co. | Biddle | Westmoreland |
| 19 | Westmoreland Coal Co. | McCullough | Westmoreland |
| 19 | Westmoreland Coal Co. | Export Nos. 1 and 2 | Westmoreland |
| 19 | Ocean Coal Co. | Ocean Nos. 1 and 2 | Westmoreland |
| 19 | Hillman Coal & Coke Co. | Edna Nos. 1 and 2 | Westmoreland |
| 19 | Keystone Coal & Coke Co. | Keystone Shaft | Westmoreland |
| 21 | Vesta Coal Co. | Nos. 4 and 5 | Washington |
| 21 | Crucible Fuel Co. | Crucible | Greene |
| 21 | Pickands Mather & Co. | Mather Collieries Nos. 1 and 2 | Greene |
| 22 | Pittsburgh Coal Co. | Banning No. 1 | Fayette |
| 22 | Pittsburgh Coal Co. | Forest Hill | Allegheny |
| 22 | Pittsburgh Coal Co. | Ocean No. 5 | Allegheny |

# Shaft Bottom for Mine Designed To Produce 13,000 Tons Daily

### Cars May Be Discharged at Either Shaft, Yet Be Returned to the Empty Track Facing in the Right Direction

TWO separate skip hoists, one in the main and one in the airshaft, a ladderway in the latter, a provision on the top of the airshaft skip to carry men and material and an air compartment that is driven only to a point above the coal and then so connected as to eliminate overcasts above the empty track are some of the unusual features of a shaft mine recently opened in West Virginia.

The dimensions of the main shaft, which contains two hoist compartments only, are 12x22 ft. in the clear. The airshaft is 13x33 ft. in the clear and contains two hoist compartments and one compartment for air. Both shafts are 630 ft. deep to the top of the coal, which is here from 6 to 9 ft. in thickness. The bed worked is what is known as the Beckley seam, which is a semi-bituminous smokeless fuel of excellent quality for bunkering, export, steam raising, smithing and domestic purposes.

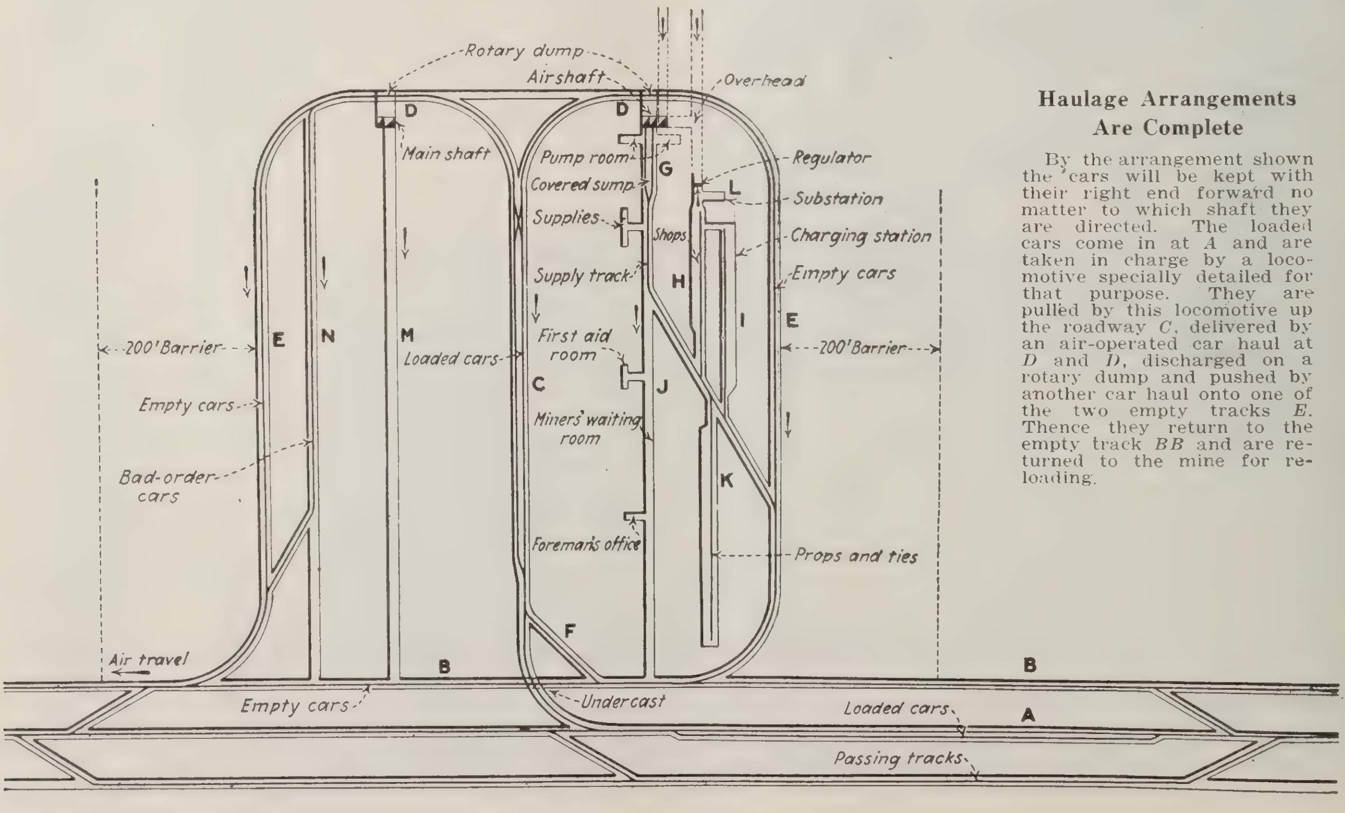
The shafts are 310 ft. apart and it is proposed to hoist coal from both by means of skips, rotary car dumps and solid-end cars of five tons capacity. The skips at the main shaft will hold 15 tons of coal each and those at the airshaft will have a capacity of five tons each. The hoists will be capable of making two and one-half trips per minute at the airshaft and one and one-half trips per minute at the main shaft.

With these figures in mind and assuming 6½ hours or 390 minutes of actual hoisting time per shift, it will be possible to handle 8,760 tons at the main shaft and 4,300 tons at the airshaft, after deducting 500 tons for a possible slate output. Both hoists combined will therefore be capable of delivering to the tipples 13,000 tons of coal in an 8-hour day. To produce this enormous tonnage it is apparent that the arrangements at the bottom for handling the mine cars must be unusually complete.

The mine engineers have given this matter careful consideration and have applied for letters patent on the plan shown in the accompanying illustration. The following considerations should be borne in mind: (1) Both shafts are to be used for hoisting coal. (2) Slate cars from any part of the mine must be directed to the airshaft dump. (3) All material will be taken in or out of the mine through the airshaft. For this purpose the skips installed in this shaft will be provided with an upper deck, or cage, upon which to carry men and materials. These cages will deliver their loads on the side opposite the dump. (4) All loads are to be readily available for dumping at either shaft. (5) Empty cars must be delivered to the empty storage tracks ready for the main-line locomotives. For this purpose it is proposed to keep a storage-battery unit in service on the bottom to handle loads from the double tracks to the cage room, and to deliver empty cars from the side wings to the empty tracks. This, however, will not be necessary until the tonnage becomes large.

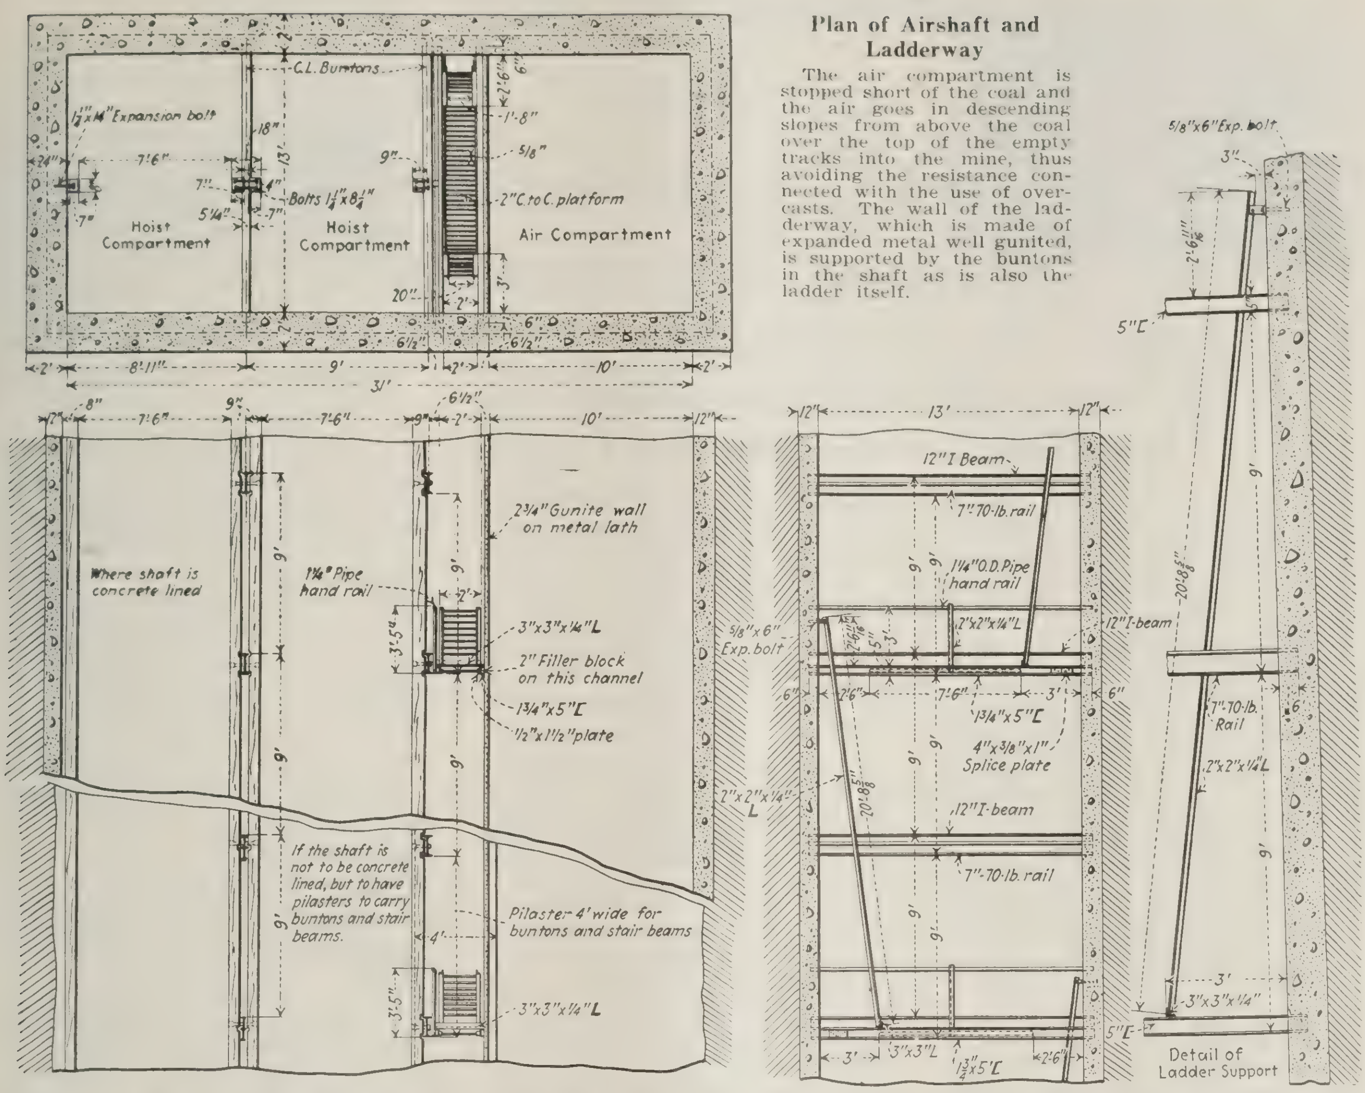
For a better understanding of the basic idea, the following explanation of the drawing will be of assistance: All loaded cars will be brought to the parting *A*. Here the main-line locomotives will cut off and pass through the designated crosscuts to the empty tracks *BB* and there pick up empties for the return trip. The inside, or bottom, locomotive will transfer the loads to the cage room *C*, which will be provided with double tracks and a diamond crossover. These tracks will be laid on a suitable down grade toward the shafts.

At *D* and *D* the cars will be picked up by air-operated car hauls that will pull them forward one car length to the two rotary dumps. Simultaneously similar ma-



**Haulage Arrangements Are Complete**

By the arrangement shown the cars will be kept with their right end forward no matter to which shaft they are directed. The loaded cars come in at *A* and are taken in charge by a locomotive specially detailed for that purpose. They are pulled by this locomotive up the roadway *C*, delivered by an air-operated car haul at *D* and *D*, discharged on a rotary dump and pushed by another car haul onto one of the two empty tracks *E*. Thence they return to the empty track *BB* and are returned to the mine for reloading.



## Plan of Airshaft and Ladderway

The air compartment is stopped short of the coal and the air goes in descending slopes from above the coal over the top of the empty tracks into the mine, thus avoiding the resistance connected with the use of overcasts. The wall of the ladderway, which is made of expanded metal well gunited, is supported by the buntons in the shaft as is also the ladder itself.

chines on the opposite sides of the dumps will push the empty cars forward an equal distance. This machinery will pull fifty loaded cars on the level and will push an equal number of empties up a 2½-per cent grade.

Materials coming down the air shaft will be discharged on tracks *G*. For the purpose of handling men and materials the upper platform of the airshaft skips will be level with the material tracks when the skips are at rest on the bottom. The shops are located at *H* and a motor-charging station is at *I*. At *J* is a restroom for the men. This will be provided with suitable seats. The room *K* is for the storage of props and ties intended for inside use. A substation is located at *L*, 2,300 volts being carried into the mine to this point through an armored, pick-proof cable.

The air compartment of the airshaft will stop before reaching the coal. From its bottom tunnels will be driven through the rock on a down grade to the floor of the coal. This will make it unnecessary to place overcasts above the empty track.

An entry, *M*, is driven from the main shaft to the empty tracks *B*, in order to provide an extra outlet for air and dust. Sprays will be installed at this point as well as at the airshaft, for the purpose of keeping down the dust when coal is being dumped. In the space *N* bad-order cars will be stored until they can be repaired.

It should be noted that cars cannot be turned around either during or after discharge, but always come right end foremost no matter which route they take. It is this arrangement for which originality is claimed. End-dump and side-dump cars can be handled by this method.

No attempt has been made to show the arrangement of inside entries, as the details of the shaft bottom may be modified to suit local conditions of grades, roof and drainage. Neither has it been attempted to show crosscuts for ventilation. In this particular instance it is proposed, with the consent of the State Mining Department, to drive long entries at the bottom by the aid of electric blowers and flexoid tubing. In some states the mining laws require that crosscuts be driven at certain intervals. In such a case it would be necessary to modify the plan to the extent of introducing parallel headings at proper distances apart.

The locations of the pumprooms, of storage for supplies, of the first-aid room and the mine foreman's office are indicated on the plan.

In the airshaft between the air and hoist compartments a ladderway is placed. This is provided with platforms at 18-ft. intervals. A partition of gunite will separate the ladderway from the air compartment. This gunite will be applied to expanded-metal lath provided with a peculiar V-shaped construction. It will be reinforced with rods laid vertically in V-grooves.

It should be remembered that the ladders and platforms are not supported by this wall, but rest on steel buntons properly placed to carry them. To these the curtain wall itself is affixed. Details of the airshaft and ladderway are shown in Fig. 2.

# News Of the Industry

## Lewis Refuses Citizens' No-Strike Plea Saying Operators Must Meet His Terms or He Will Not Confer

A fifty-ninth-second peace campaign by the business men of the anthracite region this week appeared to have failed by Tuesday night in its effort to prevent a strike of the miners next Sunday night, Aug. 31. At a public conference in Hazleton, Pa., Tuesday with the newly-formed Anthracite Business Men's Committee of 16, President Lewis of the miners refused to arbitrate and declined with some hauteur to promise that there would be no suspension. He would agree to resume wage negotiations with the operators only if they promise to consider increasing wages and adopting the check-off. The committee had no hope of getting the operators into a meeting with miners on that basis. Lewis made Tuesday a good propaganda day however.

President Lewis, of the miners, had pointedly told the business men of the anthracite region to keep their hands off the situation when they first held a Wilkes-Barre assembly Aug. 20 to see what they could do to stave off the business collapse they feared for their towns during the impending strike. But they proceeded to form their Committee of 16 anyway. Lewis declared that nothing could avert a strike except surrender by the operators to the miners' demands for wage increases and the check-off. However, when John H. Uhl of Wilkes-Barre, chairman of the no-strike committee, called on him in Philadelphia Monday, Aug. 24, he agreed to take his aides to the Hazleton meeting the next day. But he demanded to know whether the Committee was against an increase in miners' pay. Mr. Uhl declined to commit himself, saying he could not speak for the whole Committee. The 16 was nonpartisan, he said.

### Prepare for Suspension

Swift preparations for the suspension proceeded day by day. Production is rushing. Prices however, are not skyrocketing. Retailers in the largest anthracite markets are warning their customers against panic. Thus the situation in the anthracite field took on a new interest.

Meantime, in New England, the conference of governors which was called by Governor Fuller of Massachusetts, constituted itself a permanent body to do what it can to protect New England against suffering due to a shortage of anthracite, and elected John Hays Hammond its chairman. It was the consensus that New England can get along without anthracite if the people only will accept certain kinds of soft coal as other states have done and the conference will at once begin a movement to educate New Englanders to buy and burn these substitute fuels.

### Two Governors Attend in Person

Governors Fuller of Massachusetts and Brewster of Maine attended the conference in person. John W. Storrs, New Hampshire State Fuel Administrator, represented Governor Winant, and Ernest L. Sprague, Secretary of State, represented Governor Pothier of Rhode Island. John D. Sherburne represented Governor Billings of Vermont and Edward W. Goss appeared for Governor Trumbull of Connecticut.

The Anthracite Operators' Conference at Philadelphia was almost silent through it all. Maj. W. W. Inglis, chairman of the operators' sub-scale committee which served at Atlantic City before the miners broke up wage negotiations, sent a communication to Governor Fuller at Boston, reiterating the operators' entire willingness to have the anthracite dispute arbitrated. He declared once more that a suspension on Sept. 1 or on any other date "will be indefensible."

### *Hammond Chuckles at Strike Talk*

John Hays Hammond doesn't think much of the seriousness of today's strike talk because both operators and miners stand to lose and they both know it. "Two years ago," he said after the Boston conference of New England governors last week, "I told John Lewis, that I would defy him to call an anthracite strike. I said: 'Mr. Lewis, you are an intelligent man. You can call a strike but if you win you lose because you will find there will be no anthracite market left.' I haven't the slightest apprehension as to a strike of union bituminous fields. Competition between union and non-union regions is too keen."

## Nobody Is Demanding that Washington Take a Hand

By Paul Wooton

Washington Correspondent of *Coal Age*

Evidence reaching Washington indicates that the public is taking it for granted that federal intervention in the anthracite controversy is very unlikely.

When emergencies in coal have arisen before, New England has been ready to hurry delegations to Washington to demand preferential treatment, embargoes on exports or what not. It evidently has been so apparent that the federal government would keep hands off on this occasion that no single appeal has been sent to Washington and a determined campaign to help themselves has been initiated by the New England states.

Reports from other sections of the country reveal that the public is thoroughly apathetic. There is no sign that the rupture of the anthracite negotiations has aroused any anxiety or even interest. Comparatively few communications on coal from the public are reaching federal officials and there is no sign whatever of any public demand for federal activity in connection with the prospective strike.

Observers in Washington are sitting back wondering what John L. Lewis will do next. It is his move and it is being awaited with keen attention. Whether or not Mr. Lewis will attempt to make good his veiled threat to call out his bituminous men naturally is the feature of the situation on which greatest interest is focused. It is hard to understand how he could disrupt the operations of the mine owners who have faithfully met the scale, but Mr. Lewis is subject to an occasional unreasonable lapse. This adds to the uncertainty and, incidentally, to the interest of the situation. Some think the leader of the Mine Workers is getting desperate and may act on impulse.

Judging by what Mr. Lewis writes in his new book: *"The Miners' Fight for American Standards,"* he is entirely capable of calling out the bituminous miners Sept. 1. He fails to grasp the relationship between the high union scale and the highly successful competition of non-union shippers. There is not a hint of the principle long recognized by other unions, notably the clothing workers: that wages cannot exceed the ability of an industry to pay and that the union employer must be kept in business at all cost. The book holds that it is the union's business only to see that the employer pays the scale as long as he operates at all.

## Drainage Decision Makes Operation of Mines Hard In Fayette County Field

Litigation arising at Uniontown, Pa., which will have a direct bearing upon coal mining operations all over the United States as well as upon water companies has been decided in the local and state supreme courts of Pennsylvania against the coal companies. As a result coal mining operations in the Indian Creek valley, Fayette County, are virtually sealed and bottled up for the time being, at least. They represent an investment of upwards of $5,000,000.

The plaintiffs are the Pennsylvania R.R. Co., which maintains reservoirs to provide water for the railroad's engines, the Mountain Water Supply Co., the Dunbar Water Co. and the Westmoreland Water Co., serving domestic consumers in Fayette and Westmoreland Counties, and being affiliated more or less with the railroad company. The defendants in the case are a score or more of coal companies and individuals operating coal companies. The largest of these coal companies are the Melcroft, the Sagamore and the Indian Creek Coal and Coke Co.'s.

The water companies instituted litigation in the Fayette County courts some six years ago to restrain the coal companies from discharging mine waste into Indian Creek at points where this contamination would be carried into the reservoirs of the plaintiffs. The local courts about a year and a half ago found in favor of the mining companies. The state supreme court, on appeal, reversed the local courts and gave the mining companies six months in which to comply with the court's decree to cease the pollution of the stream. That six months' period has expired. The mining companies appealed to the local courts at Uniontown for a further extension of time and a decision last week held that the local courts were without authority to interfere with the findings of the supreme court and the appeal was denied. The effect of this decision is to force the suspension of mining operations on the part of the defendant coal interests.

### Try Many Remedies

The coal companies explained in detail a long series of engineering and scientific investigations in an effort to dispose of the mine waste. Chemical treatment of the discharge was discarded. Surface drainage was also held not feasible. Boring of deep wells it was found would not answer the purpose.

The engineers recommended the construction of a long, deep, underground tunnel through a lower coal seam. Into this tunnel manholes would be bored from the higher seams so that the waste would drop into the conduit. Waste from mines on the opposite side of the stream to the conduit would be piped into the tunnel. The local courts did not act upon the suggestion, however, holding that the supreme court decree giving six months in which actually to eliminate the drainage was not subject to change on the part of the lower courts. Further action on the part of the coal companies has not been decided upon.

This litigation will establish a legal precedent which may be the basis of much similar litigation all over the country and of new legislation in state assemblies and in Congress.

### Held to Precedents

The local court in its original opinion which found in favor of the coal companies held to the previous legal precedents in similar proceedings that, broadly speaking, water had the right to flow to its natural levels by the forces of nature and gravitation. The state supreme court disregarded these precedents and held for the water companies. Being an entirely intra-state litigation and not involving interstate commerce, the U. S. Supreme Court held that the decision of the state supreme court was not subject to review.

The effect of the state supreme court decision is to deny the coal companies any rights whatever in the streams. Its effect further would seem to be that every industrial concern whose operation involves waste discharge of a contaminating nature into streams of a public character or quasi-public character, have no rights whatsoever in those streams.

## *British Mine Chief Sees Revolution Ahead*

An English coal strike would have meant a revolution, A. J. Cook, secretary of the Miners' Federation, told an audience at Pontypridd, Wales, Aug. 17. Encouraged by the success of the coal miners in maintaining the present wage scale for at least another nine months, Cook declared a new era had been established, and that the words of Karl Marx about the workers of the world having nothing to lose but their chains and a world to gain, has been translated into deeds.

"Revolution will come," Cook continued. "I want a revolution that will have a disciplined army behind it—a revolution that will not only have discipline but one organized with an objective ahead of it, a revolution understanding its goal, a revolution where the mentality of the people will be free from the terrible curses of criticism and apathy."

---

Minerals resources reports which heretofore have been written by geologists of the U. S. Geological Survey, in the future will be written in the division of mineral technology of the Bureau of Mines. This division is to become the clearing house of the bureau for economics and scientific reports which are to be used in conjunction with the statistics of the Minerals Resources division. Some of the annual chapters will be written in the division of mineral resources, as F. J. Katz, F. G. Tryon, J. M. Hill and Victor Heikes are geologists as well as statisticians. The research work on the non-metallics will continue to form a part of the work of the technological division.

## Central Pennsylvania is Ready to Gain Business If Anthracite Men Quit

Talk of a strike in the anthracite field has added a little stimulus to the mining of coal in central Pennsylvania and a few of the mines which have been idle all year are working part time. Central Pennsylvania can, according to Secretary Charles O'Neill of the Central Pennsylvania Coal Producers' Association, produce 1,750,000 tons of prepared sizes of coal each month that can be used as a substitute for anthracite. As a matter of fact, adjustments can be made at many of the central Pennsylvania mines that will materially increase this quantity. This would be low-volatile coal, which is desirable for domestic fuel. Some of it is practically smokeless.

Gains in production in central Pennsylvania up to the present time have been slight, however. During the week ending Aug. 15, the loadings were 13,572 cars as compared with 13,429 cars for the week ending Aug. 8. The loadings for the first two weeks of August totaled 28,229 cars, compared with 24,135 cars the first two weeks of July. All gains are being made in mines working under the 1917 scale. Prices remain the same.

In anticipation of the largely increased volume of coal transportation out of the central Pennsylvania region due to the possibility of a strike in the anthracite field on Sept. 1, the Pennsylvania R.R. has put a large force of car repairmen to work in the Hollidaysburg yard repairing coal cars.

---

## Water Power Development Is Rapid in the East

The Department of the Interior, through the Geological Survey, has just released a report on the developed water power of the United States in 1925. The total 1925 capacity of water wheels installed in plants of 100 hp. or more, was about 10,038,000 hp., an increase of about 951,000 hp., or nearly 10½ per cent, over the total capacity of water-power plants in 1924 (9,087,000 hp.). Of this increase 99 per cent was in electric public-utility plants and 1 per cent in manufacturing plants.

The five leading water-power states in order of their rank and the developed water power for each are as follows: New York, 1,713,551; California, 1,531,480; Washington, 560,693; North Carolina, 534,600; Maine, 476,627. North Carolina has moved from fifth place in 1924 to fourth place in 1925. Based on present practice at fully developed water-power sites the undeveloped water power in the five leading states will permit of the installation of the following additional capacities in water wheels, expressed in horsepower: New York, 4,734,000; California, 7,145,000; Washington, 9,672,000; North Carolina, 526,000; Maine, 920,000.

The report indicates that water power development in the middle Atlantic, south Atlantic, and east-south Central states is progressing more rapidly than in any other sections of the country. New England's relative standing continues to decrease.

# First Two Pittsburgh Mines Open On 1917 Wages—District Union Is Forming—Ohio Reopens Two More

A movement to reopen union mines on a union basis but at 1917 wages is making a start in the Pittsburgh and the Ohio fields. The Pittsburgh Coal Co. on Aug. 20 opened Banning No. 2, which is 43 miles from Pittsburgh, and on Monday, Aug. 24, the Boggs mine of the Montour & Lake Erie Coal Co. near Imperial, Pa., started operations. In the Pomeroy Bend field in Ohio two more 1917-basis mines on Aug. 20 were added to the list of those operating.

In every case, the mines were reopened upon petition of the men. Thus the operators take the position that they are not breaking a labor contract. Instead, the contract based on the high-wage Jacksonville agreement is changed by agreement between both parties to it. The reopening of the Pittsburgh field mines represents the first fruits of the Pittsburgh Chamber of Commerce effort to induce union miners of that region to break away from the United Mine Workers, form an independent district union and go to work at 1917 wages. E. S. McCullough, a former international vice-president of the United Mine Workers is directing the campaign.

Almost simultaneously with the opening of Banning No. 2 mine of the Pittsburgh Coal Co., officials of the United Mine Workers at Pittsburgh called out on strike 70 men engaged in construction work at the Warden tipple of the same company, near McKeesport, Pa. The men were not digging coal. They were at work inside, cleaning up in connection with the building of the new tipple which is part of a $600,000 improvement project at the mine. It had been the policy of the company to give jobs in the repair project to many of its former employees, members of the United Mine Workers, in order to keep them from idleness.

The Banning No. 2 mine is at Whitsett Junction, on the Youghiogheny branch of the Pittsburgh & Lake Erie R.R., 43 miles from Pittsburgh. It normally employs 400 men. The first day operations were begun, 36 men were put to work and on Friday this was increased to 52.

The United Mine Workers had 100 pickets on hand the first day, but quietness was general. On the second day but 88 were on picket duty. The company put the men in the mine at work cleaning up and it is expected coal will be shipped soon. The coal from this mine is largely used for by-product purposes.

The Pittsburgh Coal Co. now has 39 other mines in the Pittsburgh district idle. Officials of the company were unable to predict when another mine would be opened, or where, declaring that it depended entirely upon the desires of the former employees of the company.

The petition signed by each of the men at Banning No. 2 reads:

> "I, being an employee of the Pittsburgh Coal Co. at Banning No. 2 mine, realizing that it is no longer possible to operate the mines under the Jacksonville scale, request that the company afford me employment at the November, 1917, wages.
>
> "It is my hope that the coal company will at once make every effort to procure sufficient business that will make possible my request, which I agree to abide by. It is understood that when a sufficient number of men at this mine have signed similar petitions so that work may be resumed, an opportunity will be afforded the representatives of the local union which we may form, to meet with the officials of the company for the purpose of negotiating wage and working conditions that shall govern."

Operating conditions in the Pittsburgh field under the Jacksonville scale appear to be as difficult as anywhere in the country. Mines reporting to the Pittsburgh Coal Producers' Association for the week ended Aug. 15 showed a total production of 58,057 tons, or 9.2 per cent of capacity. This compared with 9.7 per cent in the previous week and 28.6 per cent in the same period last year. Thirteen out of 80 mines were reported in operation.

The two mines that were opened on the 1917 basis in the Pomeroy Bend field Aug. 20, are the Pittsburgh Coal Co., Mine No. 17, where the tipple and power house were burned on June 17, and the Blackstone mine at Rutland, O., formerly the old Maynard Mine No. 4, where the tipple was destroyed recently. The first reopened with 75 men and the second with 80 men.

"We have all of the men we want to operate the mines," said an official of one of the companies. "And they are not imported from other fields. Neither are they farmers. They are men who formerly belonged to the union and who are willing to come back to work on the 1917 scale. We intend to operate on the 1917 scale and we will continue to operate. As fast as our tipples are burned we will reconstruct them and begin operations anew."

---

## Union Trying to Organize Logan County Now?

The presence of several important United Mine Workers organizers including Van A. Bittner in Logan County, long an open-shop mining region, has stirred up great discussion there. Mr. Bittner is said to have wired President Lewis: "Plans are working fine. Outlook very encouraging" and to have shown the telegram around rather promiscuously. Just what "plans are working fine" operators say they do not know; however, it is generally believed that organizers have been quietly at work for a long time in Logan among non-union men and that loyal unionists have now been planted in most mines. If an organization drive actually makes a strong start there, it will be the first union effort since the miners' armed march on Logan several years ago. The union this time, however, apparently will have discarded the gun for within-the-law methods.

## *"Liquid Coal" Makes a German Stew*

Industrial circles in Germany are agog over a persistent rumor that Professor Bergius, of the Badische Anilin and Soda Factory, has discovered a way to liquify coal and that this is the reason for the Badische purchase of the Hugo Stinnes Riebeck Montan Co. This was one of the property sales by German banks from the former Stinnes holdings which incensed friends of the Stinnes family who say the banks sold too cheaply. It is generally believed by technical men that the secret of turning solid carbons into liquids is now held by the Badische concern though the results of the most recent tests were not published. It has been proved that 1 lb. of liquid fuel can generate the same amount of heat as 3 or 4 lb. of solid. It is pointed out that fluids are easier and cleaner to handle than solids with the advantage of lesser weight when transported.

## June Railway Fuel Costs Lower than in May

Figures compiled by the bureau of coal economics of the National Coal Association, from the monthly reports of Class I railroads to the Interstate Commerce Commission, show that the cost of coal, including freight charges paid thereon, used by those railroads in locomotives in transportation train service during the month of June was slightly lower than in May. The averages per net ton for June are as follows: eastern district, $2.73; southern district, $2.19; western district, $3.04; the United States, $2.70. These averages represent a decrease from May of 6c. per ton in the eastern and southern districts, and a decrease of 3c. per net ton throughout the whole country. Comparison with similar figures for June, 1924, reveals a reduction in average cost of 36c. per ton in the eastern district; 41c. in the southern district; 21c. in the western district, and 32c. for the entire United States.

---

## Twin Cities Want Illinois Coal by River

A conference is to be held in St. Paul, Minn. between Twin Cities business interests and representatives of the Illinois Coal Operators' Association with Brig.-Gen. T. Q. Ashburn, chief in the inland waterways transportation. The subject is the use of the Mississippi River for transporting southern Illinois coal to the Twin Cities by barge. The question of terminals is to be discussed. It is claimed that shipping coal by barge would cut the cost $2 a ton. If the plan is feasible, it will mean a restoration of a considerable tonnage to the all-rail mines which have been nearly eliminated by the revised freight rates from Franklin County to the Twin Cities.

# West Virginia Sees Indications of General Soft-Coal Strike—Panhandle War Seems Definitely Lost by Union

West Virginia is plainly getting ready for another and more general labor conflict. The state is shot through with reports of labor activity leading many observers to the belief that the international officers of the United Mine Workers expect to carry out their threat of a nation-wide soft-coal strike Sept. 1. The actual strike within the state—that of the Panhandle region where the union has failed—is overshadowed by other impending events. In the region, where the strike is still theoretically in effect, the output from non-union mines during the first half of last week was 4,457 cars and that from union mines, 716 cars.

The conference of soft-coal union leaders in the Bellevue-Stratford hotel in Philadelphia last week, when a general survey of the anthracite and bituminous coal fields was made, has been much discussed in West Virginia. Those reported to have attended the conference were: International President John L. Lewis, Van A. Bittner, of Fairmont; Capt. Percy Tetlow, of Charleston, President of District No. 17; John O'Leary, of Pittsburgh, Pa.; Andrew R. Watkins of Yorkville, O.; Edward Dobbins, of Belleville, Ill.; C. C. Webster, of Terre Haute, Ind.; and D. K. Watkins of Albia, Ia., international executive board members, and Attorney Thomas C. Townsend, of Charleston, chief legal representative of the union in West Virginia.

It is believed that the union has done much preliminary work in the non-union fields of southern West Virginia. With hundreds of coal miners leaving the Central Competitive Field and working and intermingling in the non-union fields, it is difficult to ascertain whether they are actually there to remain at work or have been planted there to lead strikes.

The situation in northern West Virginia, formerly the union stronghold, has developed some peculiar aspects. Many of the miners, returned to work on the 1917 wage scale say they are through with the union, but the concensus is that while the union is on the rocks now it is apt to have a quick recovery, if operators do not use judgment. A large number of coal miners returned to work because of the pressure of circumstances and the ideals of the unions are as precious to them as before.

### Union Agents Talk to Miners

One of the reasons that non-union operators believe that another strike is apt to develop is the persistent manner in which agents of the union try to penetrate non-union mine properties to talk to the miners. In some cases men supposed to be selling butter, produce, vegetables were found to have no supplies to offer.

Quiet reigns in the Panhandle section of northern West Virginia from last reports. Lee Hall of Columbus, president of the Ohio miners, arrived in Wheeling, Aug. 19, and made an inspection of the tent colonies in Brooke and Hancock Counties. In commenting on the Panhandle strike, Mr. Hall said: "We are all very well pleased with the progress that is being made and the manner in which the miners are sticking to their colors. The salvation of the mining industry depends on signing the Jacksonville agreement. We expect to win the strike in West Virginia."

For some time there have been rumors in the region about the proposed investigation by the United States Senate of alleged contract-breaking in northern West Virginia. It is understood that certain miners' leaders have written to members of the Senate on that point. The belief is spreading here that International President John L. Lewis hopes to point out alleged contract-breaking in northern West Virginia, if the government authorities become involved in anthracite arbitration. Unquestionably the union miners are retaining this as a trump card.

### Cut Wages of Officials

How certain coal companies in northern West Virginia can afford to pay the union scale while others claim they cannot and, accordingly, adopted an open-shop policy is a problem that has been widely discussed in the region recently. It is understood that one company working on a union basis has been able to continue by making a slight cut in officials' wages for a limited period. Charges have been openly made that coal companies are manipulating weights in their favor but no proof has been offered. There are non-union coal operators, however, who are free to admit that their operating costs are high and in a number of instances believe that union mines can almost operate as cheap as they can.

---

## Mineral Resources Division Staff Is Chosen

In connection with the organization of the division of mineral resources and statistics of the Bureau of Mines, Department of Commerce, under the direction of F. J. Katz, engineer in charge, W. W. Adams has been designated as executive assistant to the engineer in charge. Mr. Katz, in addition to his general administrative duties, will supervise the collection of statistics relating to metals and nonmetals (except fuels). F. G. Tryon will be in charge of the coal and coke section. The petroleum and natural gas section will be under the direction of G. R. Hopkins; mine accidents will be under W. W. Adams; and foreign mineral reserves under B. L. Johnson. The Salt Lake City, Utah, field office will be conducted by V. C. Heikes; the Denver, Colo., office by C. W. Henderson; the San Francisco office by J. M. Hill; and the Joplin, Mo., office by J. P. Dunlop.

With the transfer of the division to the Bureau of Mines, effective July 1, the distribution of the annual volumes, "Mineral Resources of the United States," and of the various separate chapters of these volumes, comprising annual reports on the production and consumption of the different minerals, passed to the Bureau of Mines. This will include the separate chapters already published and still available for free distribution, as well as the chapters and volumes to be published in the future. Announcement of the issuance of these documents will hereafter be given in the postcard notices of new publications of the Bureau of Mines.

---

## *Not Planning Strike Says Illinois Union Head*

The more or less loose talk about a general soft coal miners' strike Sept. 1 in sympathy with anthracite men who expect to walk out on that date gives the radical members of the United Mine Workers their opportunity. One of them, in Illinois—William McCreysal—made a speech before a labor organization in Chicago the other day declaring the union miners of Illinois were all ready to join in such a strike and that the state officials had met and arranged it all. This brought a prompt and decisive statement from Frank Farrington, president of the Illinois district. Farrington denied that Illinois union officials had done a thing toward planning a strike. And there you are.

---

## Sunlight and Verona Coal Companies Merge

Announcement has been made of the sale of the entire capital stock of the Sunlight Coal Co., with headquarters at Indianapolis, Ind., to Joseph E. Hitt, of Chicago. The announcement marks the consummation of months of negotiation for the merging of the Sunlight Company and the Verona Coal Co., of Chicago, with their Illinois, Indiana and Kentucky strip and shaft mines. The new company will retain the name Sunlight Coal Co. Appraised values of the combined properties of the new corporation are in excess of $6,000,000. Daily capacity of mines operated by the company total approximately 7,500 tons.

The Indiana office of the new company has been transferred from Indianapolis to Boonville, Ind., where the old Sunlight company owned and operated extensive stripping properties. Mr. Hitt, who is one of the most prominent and successful operators of the middle-western field in addition to being president of the Southwest State Bank of Chicago and director of several other Chicago banks and manufacturing corporations, will be president of the new mining company. Thomas C. Mullins, who was general manager of the old Sunlight company, will become vice-president and general manager of the new company. Samuel Ashby, of Indianapolis, was president of the old company.

## Illinois Miners' Engineer Backs "Giant Power" Plan

The report of an engineer employed by the United Mine Workers was made public at Springfield, Ill., Aug. 24. It approves the "giant power plan" of President Frank Farrington, head of the Illinois union miners, as "essentially practicable from an engineering standpoint," and urges that the project "be pushed with energy and enthusiasm."

Revival of prosperity for the coal industry of Illinois, more and steadier work for miners, a 20 per cent increase in the output of the mines, a cure of the smoke nuisance and electricity for every hamlet and farm in Illinois are a few of the benefits to come, if "giant power" plants become a reality, the report reads.

Otto M. Rau, a consulting engineer of Philadelphia, Pa., with a long record of service, was the author of the report. He brings to his support Prof. S. W. Parr, of the University of Illinois, acknowledged as a high authority on coal. Prof. Parr calls the Farrington plan "a step in the right direction."

Last year President Farrington proposed his plan at the Peoria convention of the Illinois mine workers, and won permission to retain Mr. Rau. Scoffers among miners were eloquent. They demanded to know how a plan that would conserve coal, and get more use from it, could help them, whose livelihood depended not on conservation of Illinois coal, but on consumption.

Farrington's plan is as follows:

"1. Create a semi-public corporation in which District 12 (The Illinois Mine Workers), the operators, the consumers, and the state would be represented, so as to safeguard the interests of all these factions.

"2. To establish through this corporation one or more "giant power" plants on the Ohio and Mississippi Rivers for the manufacture of electricity through burning Illinois coal.

"3. To form an integrated network of major and minor power lines to make electricity available to every hamlet and farm house in the state.

"4. To treat coal at the 'giant power' station in order to save and to sell the valuable by-products now wasted.

### Economics and Engineering Involved

"There appear to be two factors involved in the present crisis in the Illinois coal industry," says Mr. Rau in his report, "one an economic and the other an engineering factor. First, coal is being delivered into Illinois from foreign fields at a price lower than that charged the consumer for Illinois coal. Second, Illinois coal can not be stored as effectively as bituminous coal from other fields. The creation of a 'giant power' industry in Illinois would eliminate both of these factors.

"Freight rates constitute a large part of the cost to the consumer of delivered coal. By developing a method for the pre-treatment or distillation of raw coal at the mines and burning the poorer grades in 'giant power' plants, distributing the power thus produced over high tension wires, as is contemplated in the Farrington plan, a permanent and steadily-increasing demand for large quantities is insured, the delivery of this power can be made at less cost than the present wasteful way of distributing raw coal and there is no problem of coal deterioration during transport or storage.

"In addition to stabilizing the demand for coal from Illinois mines, the introduction of approved methods of pretreating raw coal would enable your 'giant power' plant to offer to the big cities of the state a form of semi-anthracite coal that is practically smokeless. When it is considered that not less than 15,000,000 tons of anthracite from Pennsylvania is shipped annually into the area which could be supplied from Illinois mines, the importance of manufacturing semi-anthracite within the boundaries of your state can at once been seen.

"Furthermore, the establishment of 'giant power' plants would open up a hitherto untouched market for power in the southern portion of your state and be of untold benefit to the farmers in that section."

Mr. Rau says that of 237,181 farm families in Illinois only 4 per cent now have electric service and that this market alone would lend considerable basis for 'giant power.'

## *Herrin Strip Pit Is "Snowbirding"*

The nororious Herrin strip pit, where a mob led by union men slaughtered 21 non-unionists in 1922, once more bobs into print. This time its cause is plead before the Chicago Federation of Labor by one William McCrysal. In his reported speech he urged all union men of Chicago to band together to buy coal from the Mammoth Coal Co. this winter at $2.25 a ton. The mine more than a year ago was bought by the Mammoth Coal Co., said to be financed by the Illinois district of United Mine Workers. At once a huge damage suit by the former owners against the union organization was withdrawn. And now Illinois is treated to the spectacle of a union-owned mine indulging in "snowbird" tactics to the detriment of other mines where union men are employed.

---

Coal tonnage from the mines of Utah having direct railroad service is reported as follows by the district office of the United States bureau of mines, in co-operation with the geological survey, for June and the first six months of 1925, with comparisons with former years:

| Year | June | First 6 months |
|---|---|---|
| 1925 | 280,830 | 2,019,046 |
| 1924 | 261,975 | 1,946,766 |
| 1923 | 333,230 | 1,114,128 |
| 1922 | 337,629 | 2,100,251 |
| 1921 | 220,941 | 1,729,456 |
| 1920 | 531,600 | 2,863,450 |

## Strikers Wives Can Pray at Oklahoma Mines Now

Prayer meetings by striking miners in the Henryetta (Okla.) field were resumed Aug. 20 following a decision by the state criminal court of appeals that religious meetings were a legal form of picketing. Coal operators and a sheriff had held that prayer was masking union terrorism. Union miners and sympathizers opposing the operation of mines under less than the 1924 wage scale, formed a parade at Schulter and marched to the B. & A. mine, where prayers were offered and a resolution was adopted thanking the court, for its decision. The praying is done mainly by strikers wives while the men themselves in as large numbers as possible take up their position a stone's throw distant. While union leaders counsel peaceful picketing, state troops are still stationed there to prevent any disorder.

The reopening of Oklahoma mines on the 1917 wage scale brings more plants into operation every week. The most recent opening was at the McGinnis Coal Co.'s mine near Henryetta. The McAlester Fuel Co. on Aug. 10 opened its Bernice mine near Russellville, Ark., on a 1917 basis.

## Railroad Equipment Is in Excellent Condition

Railroads are in excellent condition to handle traffic of all sorts including coal in case of any sort of coal production difficulty this fall. Fewer locomotives were in need of repair on Aug. 1 this year than at any time since Jan. 1, 1924, according to reports filed by the railroads with the Car Service Division of the American Railway Association. The number in need of repair on that date was 10,658 or 16.7 per cent of the number on line. This was a decrease of 566 under the number in need of repair on July 15, when there were 11,224 or 17.5 per cent. It also was a decrease of 447 compared with the number in need of repair on Aug. 1 last year and a decrease of 897 compared with the number in need of repair on Aug. 1, 1923. Serviceable locomotives in storage on Aug. 1 totaled 6,313, a decrease of 218 compared with the number of such locomotives on July 15.

Freight cars in need of repair on Aug. 1 totaled 197,281 or 8.4 per cent of the number on line. This was a decrease of 2,391 under the number reported on July 15. Freight cars in need of heavy repair on Aug. 1 totaled 153,674 or 6.6 per cent, a decrease of 657 compared with July 15. Freight cars in need of light repair totaled 43,607 or 1.8 per cent. a decrease of 1,734 compared with July 15.

---

Disturbances which had marked the wildcat strike of coal miners at Zeigler, Ill., last week, resulting in the death of one man, broke out afresh Aug. 18 when gangs stopped the few miners who wanted to go back to work in the Bell & Zoller mines. President Farrington, of the Illinois district of United Mine Workers, says the outbreak is mere sovietism and that he is going to compel the strikers to fulfill their contract or get out of the union.

# Practical Pointers For Electrical And Mechanical Men

## Home-Made Lathe Now Does Shop Work Which Tied Up Expensive Machine

About many mine shops the wood lathe is a machine that is conspicuous by its absence. Nevertheless, most such shops have enough work that can and should be done in a machine of this type to fully warrant its installation. It, doubtless, is reasoned, "why buy a wood lathe when the work can be done in an engine lathe?" Such reasoning takes no account of the time lost in turning wood by the more expensive machine that might be employed in work on metal.

At the No. 4 shops of the Kingston Coal Co., Kingston, Pa., some years ago the need for a wood lathe was keenly felt. Accordingly the machine shown in the accompanying illustrations was built. The bed of this lathe is made up of channel irons mitred together at the corners and fastened by means of angles and rivets. The headstock is of cast brass and was made in the company foundry, as was also the tail stock. The cone pulleys were originally part of an engine governor, but were salvaged from the scrap heap and put to use on this lathe. The live spindle was turned up in the shop.

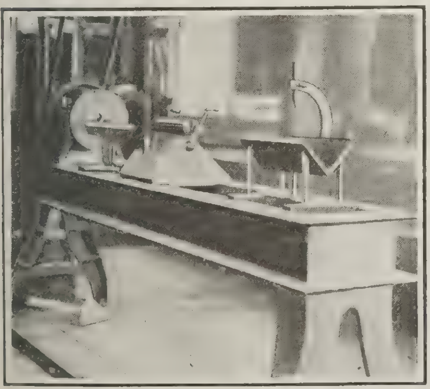


**Fig. 1—Front View of Lathe**

The bed of this machine is built up of pieces of channel iron mitred together at the corners and fastened by means of angle irons. Head and tailstocks are of brass cast in the shop foundry. The cone pulleys and lathe legs were salvaged from the scrap heap.

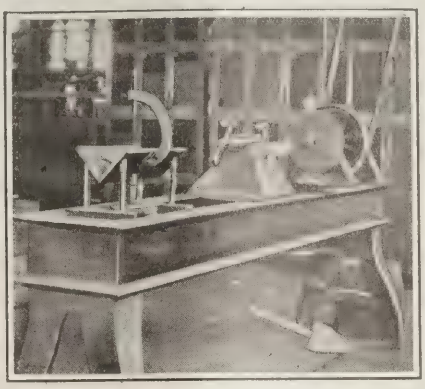

**Fig. 2—Rear View of Lathe**

This shows the device employed for holding track rollers during the boring process. The V-trough together with the C-shaped arm carrying the holding spike can be raised or lowered until the roller is in proper position. The whole device can then be fed forward against the bit or drill, carried in the headstock, by means of the tailstock spindle. After the gudgeon hole has been bored the tail spindle is backed off and the roller and its support withdrawn by hand.

Faceplates for both front and rear ends of the headstock were made from flanges. Work that will swing over the ways is, of course, turned on the front or smaller faceplate while larger work is turned on the rear plate overhanging the lathe completely, the tool rest being then supported from the floor. The regular tool rest consists of three pieces of strap iron bent and formed to proper shape and all bound together in the desired position by means of one bolt fitted with a hand-wheel nut.

One of the chief uses to which this lathe is put is the making of track rollers. At this mine props and other timbers are cut to approximate length on the surface. In this process the small ends of the sticks are cut off. These vary in length from a few inches to 4 or 5 ft. They are utilized in making slope rollers.

After they have been turned to uniform diameter on this lathe their ends are bored or drilled for the insertion of the gudgeons upon which they revolve under the action of the cable. To facilitate boring the roller ends, a special device has been made. This consists of an underframe that can be slid readily along the lathe bed, a V-trough that receives and centers the roller but which can be raised and lowered by means of a screw, and a device that keeps the roller from turning consisting of a movable spike working up or down through the end of a C-shaped arm.

When it is desired to bore gudgeon holes this device is inserted between the head and tailstocks of the lathe in place of the tool rest. A roller is then laid in the V-trough, the holding spike brought firmly against it and clamped in position by means of a set screw. The trough and roller may then be raised or lowered to the proper position, a bit or drill inserted in the live spindle and the roller fed against it by means of the tailstock center screw. When the hole has been drilled to the desired depth the tailstock screw is backed off and the roller withdrawn by hand. It can then be turned end for end and the process repeated.

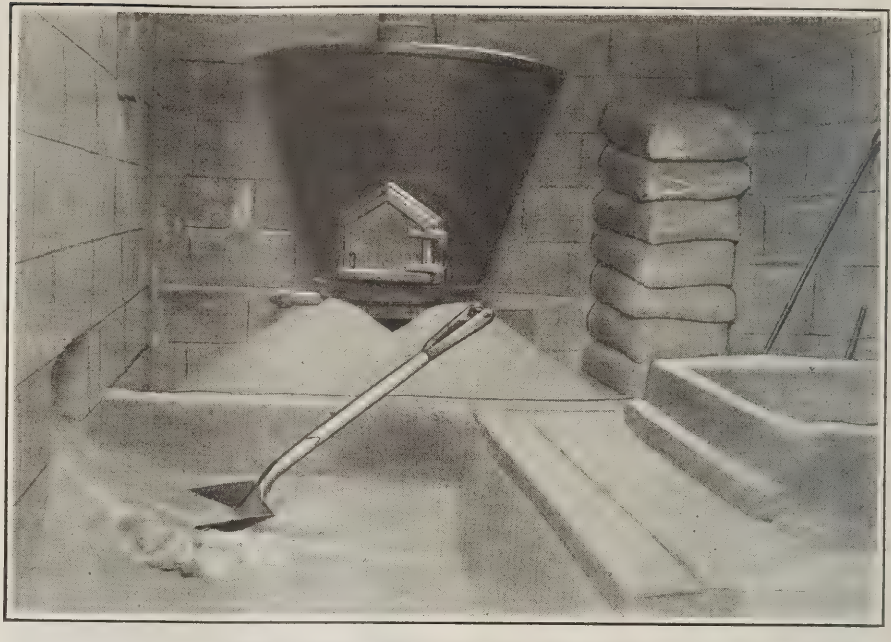
By the use of this lathe track rollers, patterns for castings and many other pieces of wood work can be turned up quickly and with all necessary accuracy. Use of this machine thus obtains results that are entirely satisfactory and a larger engine lathe is released from doing work to which it is not adapted.

## Sand Is Dropped Through Borehole to Mine

The scheme of dropping sand for haulage service through a cased borehole from the drying plant on the surface to a storage bin on a haulway underground is being looked upon with greater and greater favor. Its chief merit lies in the elimination of shoveling of the sand from the dryer into a sand car and the inconvenience and delay in transporting the sand by this means. Its application is limited to slope and snaft mines, of course, where a sand-drying plant may be erected adjacent to other buildings for convenience of attendance and yet be directly over a haulway frequented by all tram locomotives.

At the Lewis slope mine of the Hudson Coal Co., near Clarksburg, W. Va., is provided a useful arrangement for hauling and drying its sand. In the illustration is shown the drying plant which is constructed of concrete blocks. A storage bin, having a capacity equivalent to one railroad car, is separated from the drying compartment proper by a reinforced wall. In this wall at the floor line is a hole through which the sand is shoveled from the bin to the stove. Near the stove is a concrete well which converges downward to a 3-in. borehole casing. On the collar of this well, which extends about 10 in. above the floor, rests a screen with sides of wood. The screen may be lifted and overturned to dump over-mesh particles.

The borehole pierces the roof of a concrete storage bin in the mine, near the main bottom.

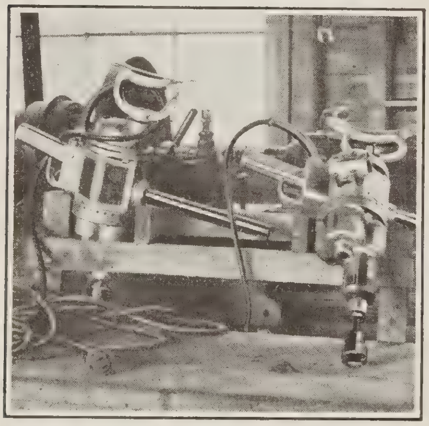


**Sand Drying Plant and Top of Borehole**

Storage is behind the wall at the left. Sand is shoveled from the inlet at the floor line into the stove. Dried sand is then dumped through the wooden-frame screen at the right into a hopper converging to a 3-in. cased borehole leading to a bin in the mine workings below.

## Power Tools Make Shop More Efficient

To assist in the repair and rebuilding of mine cars at the Detmold mine of the Maryland Coal Co., power tools are provided. The car shop is equipped with a power saw, a compressed-air chisel hammer and a combination portable power drill, socket wrench and screwdriver that has proved to be of material aid to the repair men. Any one of these three tools fits in the chuck of an electrically-driven machine, two of which are displayed in the accompanying illustration.



**Each of These Does Many Jobs**

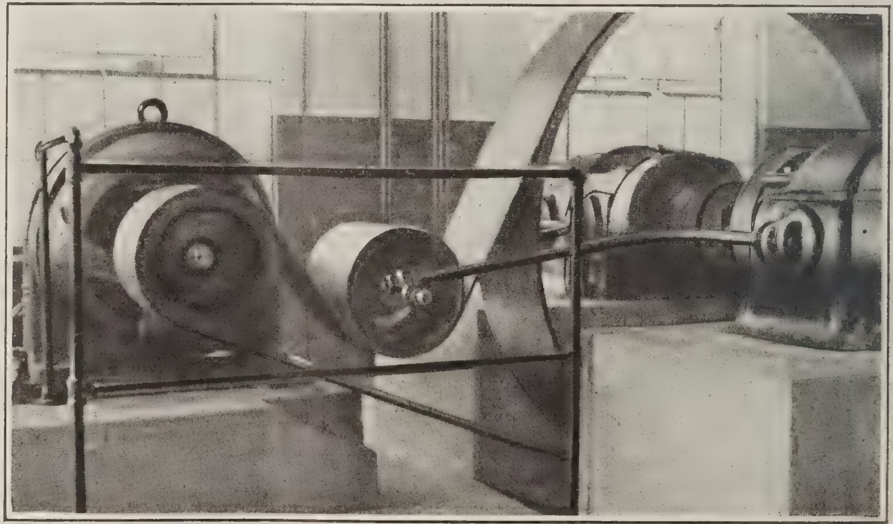
The Maryland Coal Co. does not believe in expecting men to do what machines will do more safely and quickly. Consequently it has installed two machines in the chucks of which may be inserted a drill, a socket wrench or a screwdriver.

ELKINS READ,<br>
General Supt.,<br>
Maryland Coal Co., Lonaconing, Md.

## Pulley, Well Adjusted, Runs Smoothly

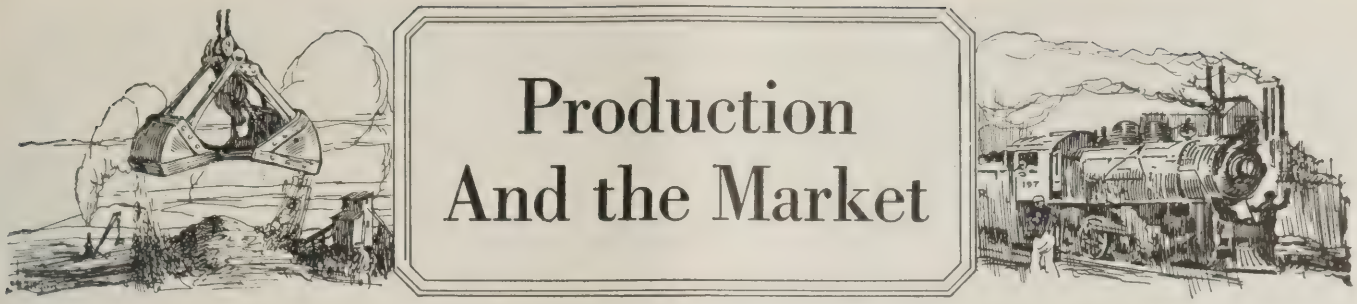
Throughout the mining field are many different types of speed reducers, but rarely do they operate as smoothly or can they be adjusted as easily as one at the Clifford shaft of the Hillside Coal & Iron Co., near Forest City, Pa. Usually each type has some particular application to which it is best suited. The greater use of equipment in modern mining methods has introduced machines of various speeds and such a condition has made necessary many belt drives. Unfortunately, it is not always that these reducers are properly maintained and adjusted.

At the Clifford shaft, an air compressor, which supplies air for drills and a hoist inside the mines, is connected to its motor through a belt. The motor is a 100-hp., 440-volt synchronous unit and is connected to the compressor by a belt with an idler pulley. The illustration shows the complete arrangement. The unusual feature is the smoothness with which the drive runs. The picture was taken when the motor was fully loaded and running at full speed. Note how steadily the idler runs. There is no jumping or flopping of the belt because the idler is mounted between two arms extending from the compressor cylinders. The idler may be adjusted in any direction.



**This Belt on a Compressor Drive Doesn't Flop About**

The photograph, taken while the machine was operating, shows how smoothly an idler can be made to run by properly adjusting its position on the supporting arms attached to the compressor.



# Production And the Market

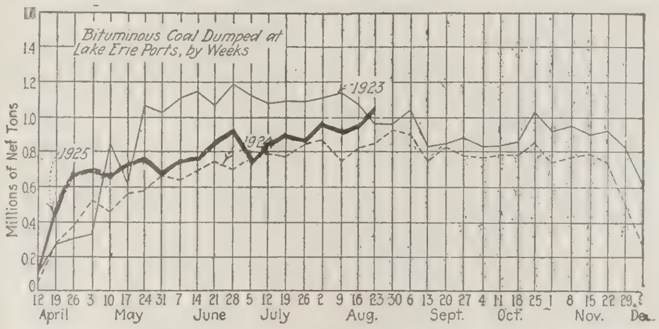
## Shadow of Oncoming Anthracite Strike Strengthens All Markets

The threat of an anthracite strike Sept. 1 cast a lengthening shadow over the coal markets of the country last week. To the bituminous producers, it was a very friendly shadow indeed, quickening demand both directly and indirectly and adding a firmer undertone to current prices. The influence, of course, was most strongly marked in the movement of soft coals suitable for domestic consumption, where the combination of the strike threat and the seasonal pick-up in that branch of the trade was felt over the entire broad stretch of territory from the Canadian border to Alabama and from Utah and the Continental Divide eastward to the Atlantic Ocean.

Indirectly this demand quickened the steam coal division of the industry, particularly industrial consumers of the higher grades of bituminous. Many of these have been trusting to day-to-day purchases in the open market to keep their plants running. Now, in a number of cases, they have entered the market to build up storage reserves against a draining of their sources of supply by alarmed eastern anthracite consumers. As a result, a number of contracts which have long been hanging fire have been closed. In one or two quarters—notably Baltimore—buyers normally dependent upon union or semi-organized fields have switched to out-and-out non-union mines to guard against interruptions to shipments.

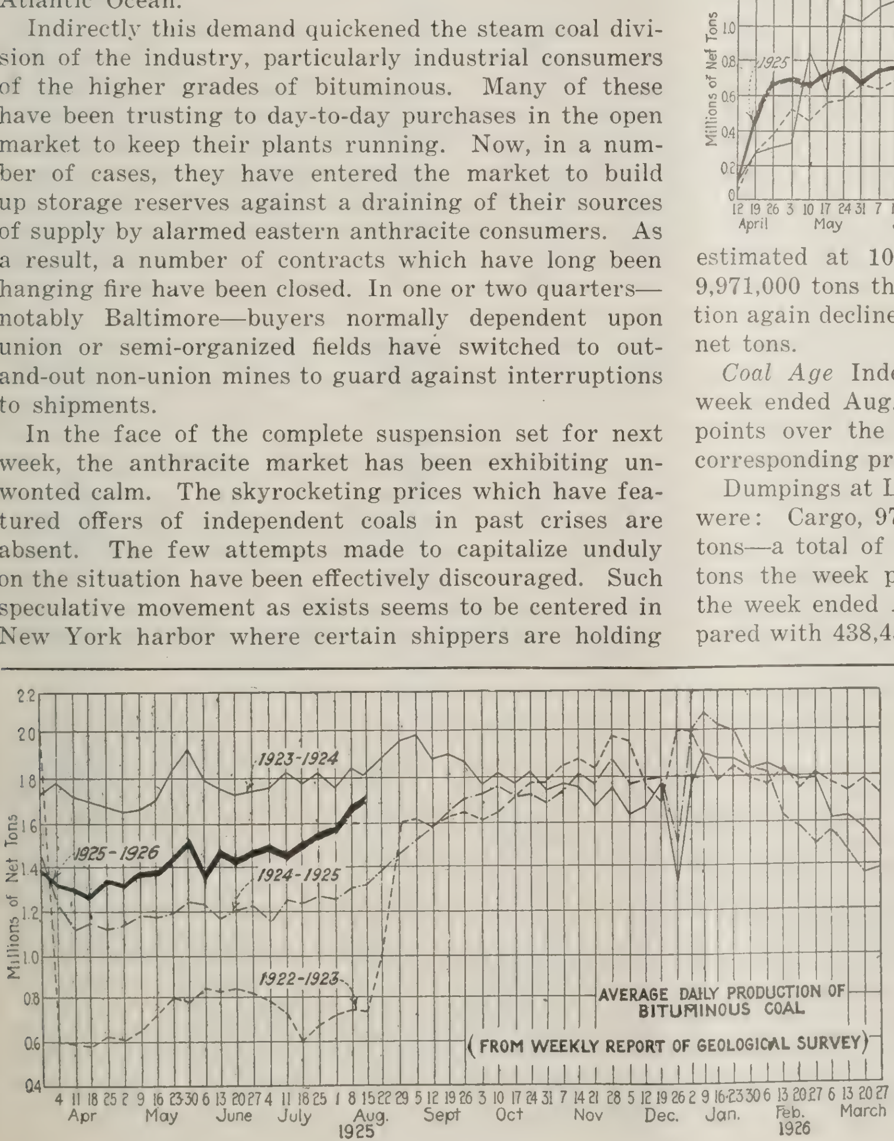
In the face of the complete suspension set for next week, the anthracite market has been exhibiting unwonted calm. The skyrocketing prices which have featured offers of independent coals in past crises are absent. The few attempts made to capitalize unduly on the situation have been effectively discouraged. Such speculative movement as exists seems to be centered in New York harbor where certain shippers are holding loaded boats for further advances in prices. The old-line companies are confining their domestic shipments to established customers and many of the independents have withdrawn quotations. Heavy drafts are being made on company stock piles of chestnut and pea to take care of orders for those sizes. Steam coals are firm all along the line, with only a limited supply of barley available.

Bituminous output for the week ended Aug. 15 is estimated at 10,244,000 net tons, as compared with 9,971,000 tons the week preceding. Anthracite production again declined, dropping from 2,061,000 to 1,904,000 net tons.



*Coal Age* Index of spot bituminous prices for the week ended Aug. 22 stood at 172, an increase of three points over the figure for the week preceding. The corresponding price was $2.08.

Dumpings at Lake Erie ports the week ended Aug. 23 were: Cargo, 978,457 net tons; steamship fuel, 50,035 tons—a total of 1,028,492 tons, compared with 949,052 tons the week preceding. Hampton Roads dumpings the week ended Aug. 20 totaled 513,780 net tons, compared with 438,456 tons the preceding week.



### Estimates of Production

(Net Tons)

(*a*) Revised since last report. (*b*) Subject to revision. (*c*) Minus two days' production to equalize number of days in the two years.

### Domestic Leads in Midwest

The Chicago market is showing signs of considerable activity, with special emphasis on the domestic sizes. Franklin County and southern Illinois generally have had no difficulty in maintaining $3.25 on 6-in. lump and 6x3-in. egg coal during the last week or so. In fact business has been coming in in such volume that a number of producers have withdrawn all prices on those sizes and are booking business only on the basis of price current at time of shipment. Buyers are willing to pay $3@$3.25 for 3x2-in. egg, and $2.50@$2.75 for 2x1¼-in. nut.

Indiana operators are gradually increasing prices on prepared coal, keeping them in line with the advances made by Illinois. Some of the producers of high grade Indiana No. 4, as well as the specialty coals of Indiana, have received as much business as they care to book on the $3 basis. Less favored coals from Indiana and Illinois are selling around $2.50 for 6-in. lump and 6x3-in. egg.

It is almost impossible to purchase anthracite. The few sales agencies who have it to offer are reserving their tonnage for old gilt-edged customers only, and even then are selling coal on the basis of price current at time of shipment. Good smokeless coals are moving freely at $4 for lump and egg, and $2.25@$2.50 for mine-run. Even on this basis few operators will commit themselves, except from day to day. High grade Kentucky coals are selling at $2.75@$3, with the demand very strong.

The position of steam coals on the Chicago market is still depressing. Good Indiana screenings can be had at $1.40, and high grade Illinois screenings in large quantities are easy at around $1.75. It is anticipated that there will be no change in the steam-coal market for the time being.

Business ranges from active to fair on domestic sizes in Williamson, Franklin and Saline Counties. Most mines are behind on lump shipments. It is feared so many mines will start up again to meet the demand that they will overdo the situation and thus bring on a price-killing production. Railroad demand is fairly good from both strip and shaft mines. The fine coal output is more than ample to take care of needs. The field as a whole is working three to five days. Prices on prepared sizes went up 25c. on Tuesday (Aug. 25).

In the Duquoin district three days a week seems to be the average. Nut and screenings drag but lump is well sold up. Prices are unchanged. In the Mt. Olive district increased domestic demand indicates what can be expected in September, but steam sizes are lagging. Working time averages two and three days a week. Idle mines have announced no reopening dates. Coal is still sacrificed in the Standard district, where mines are not averaging better than two or three days. Screenings are below $1; 2-in. lump is $2.10. Railroad buying is light.

St. Louis domestic for the better grades of Illinois coal continues good, but there may be an abrupt switch this week
